BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Let's Get Somewhere!

When this issue of The Missouri Farmer reaches our readers the old year will have closed its books and, like the water which has passed over the old mill wheel, will be gone forevermore—a page in the history of the past—a curtain drawn over the joys and heartaches of which it had its full share even as will the New Year upon whose threshold we stand at this moment. From a crop standpoint, so far as Missouri was concerned, it might have been much better—and yet, taking it all in all, we fared reasonably well when we think of those who dwell amid the cotton fields of the South and in other sections of the Country where the scourge of the drouth and insects fell with still heavier hand. But, after all, one of the finest things about life is that ever recurring spirit of hope which enables us to repair the failures of yesterday in the greater accomplishments of tomorrow. Nobody but a coward sulks and gives up the fight. So long as robust health remains there is no such word as fail in the dictionary of the real man—for the victories truly worth while are always bought by toil and sweat and oftentimes with human life itself.

In the beginning of this New Year, therefore, let's you and I realize that we have a real part to play in life—that there is more to it than eating three meals a day and doing our daily tasks in mechanical fashion—that life is a rare privilege which we should utilize by taking our place along-side of those who are doing things—who are making those dependent upon them happy—who are in the thick of the fight from sunrise to sunset and who are making the community in which they live and the World generally better—who are adding something to the sum total of human happiness—who play well their part though the part be obscure and humble.

In the meantime, get it out of your head that the men who win were born lucky. There never was a bigger fool idea or one which has done more to dull the keen edge of ambition. "You are a man of marvelous genius" admiringly remarked a magazine writer to Thomas A. Edison recently. The old grizzled, grease begrimed inventor looked up from his work-bench for a moment and then said with undisguised disgust, "Genius—fiddlesticks! The things I have done have come from sweating and working while other men slept"—and with that he began tinkering away once more at a new storage battery. And so I say to you that back of nine out of ten big red barns in Missouri—back of every fine herd of cattle or hogs—back of every alfalfa patch and well-tilled field in this splendid state is a farmer who thinks—a farmer who takes a pride in his work—who, some years ago, pulled off his coat, gritted his teeth and said, "I am going to win!"—and from the day when the Recording Angel first took up his pen to this hour that kind of men always have won and they always will.

So let's hitch up our belt a notch or two and sail into 1915 with a new-born determination to get somewhere! If there is a mortgage which has been haunting us, let's pay it off—or at least knock a big hole in it—and let's begin by being more kind and speaking more softly to our loved ones in order that they may join in the good fight heart and soul. Then let's take every pig and cow and horse and old speckled hen on the farm into the wholesome conspiracy. Let's all pull together. There's a pile of gold concealed in the soil of every Missouri farm—and hard work, enthusiasm and good judgment will put it to your credit in the local bank. But to win at anything our hearts must be on fire with the love of conquest. We must open the windows of our souls and let the sun shine in—and then the crow of every rooster will be a cheer for victory and the call of every quail a bugle sound spurring us on to the golden harvest fields that are to be.

So let's to work with a hearty zest and a will as never before—and to help you as much as we can, we promise you the finest farm paper from now until spring you ever read. While the storm howls outside—while the children study the lessons they will recite on the morrow—while mother sits contentedly in the old rocker and knits or sews—into the circle of this fireside where love dwells in peace we will come every two weeks with a message which will enable you to plan more carefully and to win more certainly the coming battle of the fields upon which, after all, depends the true happiness of humanity. —By Author of After Thoughts.

HOW THE WAR WILL AFFECT AMERICAN AGRICULTURE

By Hon. Ralph W. Moss, Member of Congress, in Indiana Farmer.

The war now raging in Europe, involving the principal nations, presents the greatest crisis in the history of the world. No other convulsion among civilized people can compare with it in magnitude or possible destructive results. Happily we are outside of the zone of physical combat, but our nation cannot escape being most profoundly affected by this great catastrophe. What will be its probable effect on American agriculture?

The answer will in part depend on the duration of the war; but certain tendencies are manifest and it does not require the gift of phophecy to foretell some of the results which will flow from this great struggle. The southern farmer stands to lose heavily and it is not beyond the possibilities that this war will force the reorganization of his agriculture. All agricultural authorities have deplored the stubborn resolution of the average southern farmer to depend upon a single crop for his income. Cotton is the great agricultural staple of that section. This product must seek a foreign market, as less than forty per cent of our crop is taken by domestic consumption. More than sixty per cent of this crop is purchased by those European nations which are now at war. Cotton is also largely produced in Egypt and South Africa. These countries are not included in the war zone. We thus have the anomalous situation that all cotton-producing countries are in peace while the principal cotton consuming countries are at war. The paralysis of the manufacturing industries in the war zone destroyed the market for cotton overnight. The price fell from 14 cents to 9 cents per pound in a day. Practically speaking, there has been no market for spot cotton since the first declaration of war, and the new crop is estimated at more than 16,000,000 bales. The European war has therefore produced the most serious condition which the cotton farmer has faced since the Civil War. The inevitable rise in the cost of living and other expenses incident to the production of cotton only adds to the present disadvantages of the exclusive cotton planter. The government in conjunction with all public spirited men of the south is striving to mitigate this condition; but the normal balance is so greatly disturbed and the baleful influences of the war are projected so directly against the cotton market that no agency can seemingly prevent great losses as measured with normal conditions.

The Situation

Fortunately, for the farmers of the Middle West, every result of this war will be to increase the price of our farm products and thereby enhance the prosperity of our farmers. I have frequently remarked in recent public addresses that the present generations of farmers are the most favored of any men since the day of Adam. I had reference of course to the improvement of transportation facilities; our splendid markets; good roads; improved live stock; improved strains of seed grains; improved agricultural tools; rising prices for land and the wide diffusion of scientific knowledge of agriculture. These manifest advantages were never before placed at the command of an intelligent, self-governed people, but this European crime against the brotherhood of man has largely augmented even these wonderful advantages. The great nations now at war produce essentially the same agricultural products as do our United States farmers. These are the great food staples, without which nations cannot sustain life.

The world faces famine conditions in Europe while we have but a scanty grain supply in the United States.

In meat products, the world is not more fortunate. It is well known that those European countries now at war do not grow a full domestic supply of meat even under their low standard of living. The soldier will consume more meat on the battlefield than he would have done in the shelter of his humble home. It is certain that breeding and milk herds will be seized for slaughter. A sustained war will so diminish brood stocks of animals that Europe can not build up a normal suply of live stock in a generation. At the same moment, we have so depleted our supply of beef animals that we can barely feed our own people.

Turn any way you may, and you will be confronted with a demand for the products of our farms which will exceed our ability to supply for years to come. From this conclusion there is no escape. We are entering a long period of high prices for farm products which no governmental investigation can prevent. The prices of these products must rise until they reach the limit of the ability of the purchaser to pay. We are entering for the first time in the history of our nation a period when the necessities of life are to be measured out to men, not in proportion to their ability to consume, but in proportion to their ability to pay the prices which the hunger of the world will place upon an inadequate food supply. This is the inevitable result of this stupendous crime against the future as well as the present civilization of the world.

In this hour of temptation of high prices, let me urge you not to sacrifice your breeding herds or reduce them below the proper level. Remembr that high prices are here to stay for years and not for days. It is time to enlarge your operations and we should not cripple our future income by selling useful breeding animals even to appease the desperate hunger of the hour. Do not hesitate to go moderately in debt if necessary to enlarge your activities. The next legislature must enact a model rural credits law; we can, however, with perfect safety go forward under our new Federal Reserve act. All legitimate demands of productive industry will be met and there is no possibility of a money panic such as we have been familiar with in the past. We met the shock of this world crisis without a single commercial failure, except among those engaged in speculative buying. The demand is here; prices are good and will grow better; financial conditions are sound; currency will be supplied in ample volume to meet every legitimate demand from industry. It is a time for every man to get busy for he is certain to receive an ample reward for his industry.

Four Wheels—Bigger Yields

YOU CAN have the benefits of better planting and vastly better crops with the **Hayes** Four-Wheel. Every kernel planted *exactly the same depth*—every hill in *perfect* check—an even stand—*surer* germination and *quicker* growth—no missing hills, *no bare spots* in your fields; such conditions will mean *more* corn for you, *better corn, more money.*

This planter is *guaranteed.* It *must* be all we claim and all you expect. 180,000 users verify that **Hayes** Four-Wheels regulate depth of planting to the *fraction of an inch.* Corn all comes up at the same time, allows earlier cultivation, an earlier harvest, a *better quality* and *bigger quantity.*

Hayes Four-Wheels guarantee *surer germination* and *quicker growth.* Wheels pack the dirt around the corn to hold the moisture and leave a *ridge of loose soil* on top. Ridge over corn prevents washouts in hilly fields and gives greater surface for sun's heat.

Covers where all ordinary open wheels fail—even in wet and sticky ground. Guaranteed not to clog. Short coupled, light draft and turns in shortest space. *Checks with absolute accuracy,* regardless of team's speed. Cross rows straighter than the way you drive.

The **Hayes** Drop *never misses a hill.* Simple, reliable and most efficient. Fewer parts, less breakage and delays. Has no clutch to miss and give trouble. *Never cracks or grinds the seed.* Will drop accurately any size or shape kernel. *No bare spots* in **Hayes** planted fields. No replanting necessary. Increased yields soon pay for it.

Free book "A. P." of Planter Facts tells all about the **Hayes.** Write for it today — a postal, or if you wish a letter, asking any questions on planting problems.

HAYES PUMP & PLANTER CO., Galva, Ill.

head of the State Soils Laboratory. It is of particular value to the Missouri farmer who actually has waste wood to burn.

Wood ashes contain a large proportion of lime which makes them of value in correcting acid soils. Oftentimes land intended for clover or alfalfa can be better prepared for the crop by a top dressing of fresh wood ashes, either hard or soft wood being equally satisfactory. Such a treatment will be of especial value on marshy and sandy soils.

If not allowed to leach out wood ashes are also rich in potash and so form a home source for a much needed element. Practically all of our potash supply has been imported into this country from certain of the countries of Europe now at war which fact has caused considerable concern with many here who purchase in large quantities.

Mr. Whitson sees no reason for alarm over the potash situation. He does not think that the war will absolutely prohibit the importation of potash from German mines for any great period and as he points out the American supply is already being diluted in order to make it last.

Whether or not it will pay to use ashes for agricultural purposes depends upon the distance they have to be hauled. When buying ashes the purchaser should satisfy himself that the material is neither adulterated nor full of coal residue.

GET IT FREE

We are giving Ropp's New Calculator FREE to every farmer or land owner who wants to put up a fence that will last. Ropp's Calculator should be in the hands of every farmer. It will instantly give the correct answer to any business problem that can be settled by arithmetic. We will also send you our free illustrated catalog on

SQUARE DEAL FENCE

Which tells you why it is better than any other fence and where to get it. If you want a farm fence that will last, and stay trim and tight the year round, write for these FREE books today. 32

Above-Ground Ice House Usually More Economical Than Cellar Type.

Since ice at best is a highly perishable product, requiring special equipment for its preservation, the farmer who wishes to locate an ice house should take advantage of such natural advantages as are offered by shade and exposure. A shady situation with a northern exposure has a decided advantage as a location for such a building.

In general design ice houses are of three types:

1. Those built entirely above ground.
2. Those built partly above and partly under ground.
3. Those of the cellar type, built entirely below ground.

The above-ground structure is by far the most common of these types.

The advantages and disadvantages of these three types may be briefly stated as follows:

Above-ground houses can, as a rule, be more economically constructed than either of the other designs. Excavations are expensive to make and difficult to insulate and drain properly. Insulation and drainage are two of the most important factors in the preservation of ice. It is true that the temperature of the earth varies less than that of the air, but the fact that the temperature of the earth 6 or 8 feet below the surface remains at or about 55 F. the year round makes it quite as important to protect the stored ice against the earth heat as against the heated air. It is more difficult to remove ice as needed during the season from pits than from structures above ground. Slight advantages are apparent at harvest time in favor of the cellar or the half-sunken types of house, and under some circumstances they are to be preferred to the other type.—Weekly News Letter, U. S. Department of Agriculture.

No Holes To Dig with APEX Steel Drive Posts

SIMPLY drive them into place with a few blows of the sledge while you stand in the wagon. Can you imagine anything easier? What could save you more work? You can save money, too—8 to 10 cents on the setting of each post. With steel posts you can burn fence rows clean—protect your stock from lightning. Write for literature.

APEX Fence Fits Rolling Ground

The swinging joint leaves the line wires flexible. It's easier to put up than any other fence that we know of. Does not bind, buckle, sag or snap. Stays are reinforced to double strength at every joint. Strong, rigid stays and thorough galvanizing make Apex fence last.

Write for Helpful Books

SAVE YOUR WOOD ASHES

Don't waste wood ashes. Apply them, as produced, to acid osils.

This is the advice of A. R. Whitson,

A NORTHERN NUT FARM

The South has its pecan farms; California has its walnut farms, and the New England, Middle Atlantic and North Central states can soon have their shagbark farms, black walnut farms, and filbert farms. In more favored locations, there may also be northern pecan and hardy English walnut farms. We now know how to graft and bud all these trees and it merely needs the finding of the best parent trees. The pecans are already in hand, and there are some very promising English walnuts on the list. We already have one very fine black walnut, and a good shagbark or two. I know of one shagbark tree that has produced $10 worth at current prices. The nuts of that tree come out in whole halves (that is the important thing about these thick shelled nuts), and a meadow full of such trees would support a family. There are doubtless better ones to be found.

If you have a promising black walnut, shagbark, or hazel, send samples of the nuts and an account of its bearing record to Dr. W. C. Deming, Georgetown, Conn. He is secretary of the Northern Nut Growers' Association, an organization that is trying to gather the information to give the North a nut industry. They are offering $5 prizes for best black walnut, hickory, and filbert. Ask your neighbors about it and help America to discover herself. J. Russel Smith.

Need for Better Rural Credits

By Geo. B. Ellis, Managing Editor

What public demand is there for a better system of rural credits? The Missouri Farmer would like to have its readers satisfy themselves that there is a real demand, an urgent necessity for a better plan than we now have for making loans to men who want to buy land for homes; or owners of land who desire to increase the productiveness of the land by clearing off timber, putting in drainage and increasing the fertility; or for the necessary capital to buy the live stock and other equipment for handling the land in a profitable way. In the first place we may say that political platforms usually reflect the opinions of a large number of the people of the country and furthermore, when all the leading political parties of the country declare in favor of anything it is evident that there is an urgent necessity for it. All three of the great political parties asking the votes of the people in the presidential election of 1912 declared in favor of a better system of rural credits. They certainly would not have done this to catch votes unless a large element of voters were demanding it. A large element of voters would not demand it unless there was an economic reason for it.

The Big Farmers' Debt

The fact is the farmers of this country are doing a lot of business on borrowed money. According to the United States Department of Agriculture the farmers of this country were carrying a debt in 1910 of approximately $5,000,000,000. An investigation of the rates of interest farmers were paying in all the states showed the average rate to be 7.75 per cent. This rate included all loans made to farmers—short-time bank loans, farm mortgages, notes for machinery and feed purchased, commissions for renewals, etc. The farmers must therefore pay an annual interest charge of $387,500,000 before their taxes, hired labor, fertilizer, repairs, improvements, living expenses or anything else can be paid for. For the last few months the most widely discussed question in this country has been the so-called "railroad crisis." We have been told that the railroads were losing money. That they could not pay interest on the $20,000,000,000 of capital invested and keep their millions of laborers employed without an increase in rates. But what are farmers to do who are paying an interest rate of at least 50 per cent more than the railroads pay, and with more than twice the money invested? There is invested in the farms and farm equipment of this country approximately $41,000,000,000. If the farmers were allowed only 6 per cent on this vast capitalization it would take more than one-fourth the average value of all the farm crops produced to pay the annual interest charge. Investigation has shown that there are thousands of farms which are not producing a fair labor-income for the operators to say nothing about interest on the price of the farms and machinery necessary to run them. Another class of farms are making the current average labor income with from 1 to 3 per cent on the investment, while few farms show a sufficient income to pay the labor and reasonable interest and have anything left for profit. Does this show a condition that portends a satisfactory and profitable agriculture in the future? Profitable farming is the very foundation of the prosperity of this country and all other industries will languish when the farmer fails if that time should ever come.

Is There Danger Ahead?

Home ownership is an inborn trait of human character. The higher the civilization of a people the better is their protection in the privacy of the home. The control and ownership of land is today the greatest disturbing factor concerning the peace of the world. Governmental control over land for the benefit of rulers and subjects is the real cause of the greatest war in all history—the present war in Europe. The right of individual ownership of land, the right of men to enjoy the fruits of their own hard labor in the cultivation of the soil has been a disturbing factor in the peace of all nations since the dawn of history. The opportunity to own a home and to own the little patch of land he tills has been at the bottom of all the trouble the people of Ireland have had for ages. The right to own land by those who cultivate it is ninety-nine-hundredths of the cause of all the wars in Mexico. And when we realize that in this great country of ours comparatively new in its civilization that less than one-fifth of the number owning farm lands hold three-fifths of all land in farms it is time for us to stop and consider. Is it any wonder our statesmen are concrened about the future welfare of this country? What may we expect in a democratic country where the voice of the pauper in elections is equal the voice of the millionaire if the time ever comes when only a few people own the land? Had we not better study this great question seriously now before that time comes? The United States Census for 1910 disclosed these significant facts: Out of more than six million farms in this country a less number than one per cent (50,135) contain 23.6 per cent of all the land. If we take the three higher groups as classified by size of farm we find that 1,153,605 farms have possession of 516,024,603 acres of land while the other 5,207,897 farms have only 362,773,722 acres. The tendency is towards larger land holdings and fewer land owners and more land operated by tenants. In 1900 the Census figures show that 63.7 per cent of all farm lands was operated by owners, while in 1910 the per cent of owners had decreased to 62.1 per cent. In 1900 the tenant farmers were operating 35.3 per cent of the land but in 1910 they were operating 37 per cent of the acreage. In connection with these figures we should also consider the fact that the relative number of farms covered with a mortgage is on the increase. The number of mortgaged farms in 1910 was 17.7 per cent greater than in 1900, while the number free from mortgage had increased only 4.4 per cent. An increase of the number of mortgaged farms might possibly show a satisfactory condition were it shown at the same time that the relative number of land owners were increasing. That is to say we would consider it a promising outlook if the conditions were favorable for the tenant farmers and the young men who are just taking up farming on their own account to buy land and mortgage it for future payment. But what must we think of the future of our country when the tendency is for fewer land owners and an increase of the number of farm mortgages at the same time?

Millions of Idle Acres

Our wise men have been deeply concerned of late years because so many of our young men of the country are leaving the farm and are drifting to the already over-crowded cities. And well may they be. In all the history of this country the army of unemployed was never so great as it is today. On the other hand we have millions of acres of land in most every state in the Union capable of producing paying crops if put into a good state of cultivation. Then why is it our young men leave this opportunity and drift to the crowded cities? The first reason is that the laws of this country have permitted holding land out of use for speculative purposes. It has been more profitable in thousands of instances to hold land out of production just for its increase in value than it would have been to cultivate it. The time has come when the people of this country should look upon large tracts of land kept idle as a danger to our future welfare.

The first step or at least one of the first steps our government should take is to put land holding on a sound and permanent basis. To do that the poor man who is able bodied and willing to work should be furnished capital according to his needs and his ability to handle it and at such a reasonable rate that he can afford to use it. The theory that the government is founded for the protection of property rights as against human rights is wrong. No democratic government can stand long and prosper without recognizing the superior rights of man over the rights of property. It is not within the province of this article to discuss plans for better farm credits, we will do that in subsequent issues, but we might digress enough to say that we believe that the farmers' credit based on their reputation for honesty and industry if mobilized with the value of the land itself will be an entirely adequate basis upon which we can establish a farm loan plan at a low rate of interest. All that is necessary from either the state or national government is to furnish the supervision that will be a guarantee against fraud and thus without expense to the government a system can be put into effect that will furnish money to our food producers at the lowest possible rate of interest.

Why Better Rural Credits in Missouri?

Now for a moment let us look at this proposition from a Missouri point of view—looking at the proposition first from the side of the state's welfare. There are seventeen or eighteen million acres of timber lands in Missouri. While a large part of these lands should remain permanently in woodland there are several million acres that would be more profitable were they cleared up and put in cultivation. This would increase the resources and the taxable wealth of the state and as a result the state's revenues would be increased. Then there are a good many thousands of acres of wet lands that can be reclaimed and made profitable. True, some of these lands are being improved by corporations and large land holders but if we believe that the welfare of the state depends upon a general distribution of land ownership why not make it possible for farmers to buy these lands on long time loans at a low rate of interest and improve them and make homes for a greater population? It is a well known fact that much of our old farm land is so depleted in soil fertility that before it can be farmed profitably it will have to be built up, and the building up is a slow, expensive process and hence requires long-time loans.

Finally, we ask what are the conditions regulating farm loans that ought to be changed? First, farm loans are made for too short a time. Most loans are made for five years but few are paid off in that time. The renewal of the loan makes the farmer nervous because of the uncertainty of whether or not the loan will be called and also because there is most always extra expense for fees and commissions. Farm loans are made in this state at varying rates from 5 to 8 per cent and there is most always a commission that will increase the rate from one-half to one per cent. So the average current rate in Missouri for what is termed long-time loans is somewhere between 6 and 7 per cent. Under the present system the loan is usually made on the current valuation of the land irrespective of how the land is being farmed. Under a system of state regulation the farmer could be required to follow approved methods of cultivation or the loan could be refused.

Under our present system the borrower of $1000 at 6 per cent interest

629048

will in the course of thirty years pay out $1800 and still owe the original debt. Under a state regulated system the same payment of 6 per cent or possibly less would pay the interest and extinguish the debt in the same time. It is readily seen that this will furnish encouragement to the poor man, the tenant or the hired man to strive to own his own home.

It is sometimes urged that a low rate of interest will encourage speculation in land values but this is easily controlled by limiting the amount of the loan to any person and to make loans for certain purposes only. The first purpose of a loan should be for the purchase of land, and should be made only to those who will occupy and cultivate the land. When a party already owns land that must be improved to make it productive, such as drainage, clearing forests, etc., loans should be made for that purpose. It would be wise in certain cases to loan money for making improvements, particularly productive improvements such as silos, better barns and deep wells. The amount of live stock and the quality of live stock could both be greatly benefited by more capital and these should be included in the uses for which the loan is to be made.

These facts are before us: The population of this country is increasing faster than production. Under present methods much of our land is growing less productive. Unless we improve our methods and cultivate more of our waste land and make all our land yield more somebody in this country will go hungry. Which shall it be?

A FEAST FOR FARMERS

The authorities in charge announce that Farmers' Week in the Agricultural College promises to be bigger and better than ever this year. The program starts out with a big number the first night and in fact there will be a big number every day of the meeting. President H. J. Waters, of the Kansas Agricultural College, will deliver an illustrated lecture the first night on World Agriculture that will be full of interest and meat for thought for every one. President Waters is a Missouri product, reared on a Ralls County farm, graduated from our College of Agriculture and knows Missouri farm conditions better than any other man we know of. He will give you something to think about all winter. Hon. D. F. Houston, U. S. Secretary of Agriculture, Mrs. Harbert, president International Farm Women's Congress, Miss Louise Johnson, national authority on domestic science, Col. George Woodruff, an authority on rural credits and a host of other eminent men and women will take part in the program.

The State Corn Show has for several years been one of the attractions of the meeting worth going across the state to see and promises this year to be fully up to its past high standard. Regular courses of lectures will be given for men, women, boys and girls and there need not be an idle moment spent by any one for the whole time of the meeting. Remember the date, January 11 to 15.

The Ohio man reports, "a pet bull dog went mad and chewed up a Collie and a fine bird dog." He also writes, "Bliss Cabal, on the Mrs. Geo. King farm, lost two cows valued at over $250, from eating a few leaves of tobacco each." One of the cows died in an hour, the other lived two days and was treated by a skilled veterinarian. Cattle have been known to eat as much as a pound of tobacco and live, and two ounces has been known to kill within an hour.

FOR CHEAPER FARM LOANS

A number of plans are in operation in different European countries to give farmers the benefit of long time loans at a low rate of interest in order to encourage the land operator to become a land owner. Some plan will doubtless be agreed upon this winter by the Missouri Legislature and it is important that whatever plan is adopted that it be sound and also that it can be economically administered. The following plan proposed by Col. F. D. Gardner of St. Louis is presented for the careful consideration of our readers and a plan we think worthy of our most thoughtful consideration:

There shall be established in the State Department of Banking a Bureau of Farm Loans. A director should be appointed by the Governor and his salary fixed by the Legislature, the bureau to be under the direction of the State Bank Commissioner.

The bureau shall receive applications for farm loans, may appraise same, and may appoint in each county in the State a board of appraisers, to consist of county officials who already are in the service of the State. For instance, the County Collector, the presiding Judge of the County Court, and the district State Bank Examiner, the bureau to have the privilege of calling into consultation at any time the president or officials of any bank in any State or county from which the application is received.

When duly accepted and approved by the bureau, the bureau may issue, at convenient periods, quarterly or semi-annually, bonds or debentures against farm loans, not exceeding 50 per cent of their appraised value, loans to be used for the following purposes:

(a) To increase production from said land.

(b) To make useful improvements upon lands mortgaged.

(c) To make part payments of the purchase price, or to pay off indebtedness.

(d) Twenty-five per cent of said loan may be used for purchase of stock and machinery.

No loans to be made except on what is called the amortization plan, and may run as long as 30 years. For example: If the bonds were sold by the State at 4.3 per cent and to this were added ½ per cent of 1 per cent as a guarantee against loss, and to create a reserve, we would have a total of 4.8 per cent. The loan then would amortizise as follows:

Duration	Annuities
5 years	$22.40
10 years	12.40
15 years	9.10
20 years	7.50
25 years	6.50
30 years	5.90

If, therefore, the State sold the bonds for 4.8 per cent, and a reserve of one-half per cent additional, for guarantee and reserve, the loan would mature according to the desire of the borrower on the above basis. It will be seen that if the loan was for 25 years the borrower would be paying only a total of 6½ per cent annually. Or, if for 30 years, then 5.9 per cent annually. The borrower would have the privilege at any semi-annual period of retiring any additional part of the loan he desires and the interest should stop at that period.

State to Put Up $500,000

The State shall advance $500,000, which shall be deposited in the usual State depository, or may be invested in State bonds, the State retaining the interest on deposit or bonds. This fund is to be placed as a capital for the land banks described, or in trust, so to speak, for the guarantee of the bonds, and shall be exempt from taxation.

These bonds may be issued up to 30 times the amount of the capital, which would be $15,000,000. As the reserve increases there may be issued further 30 times the amount of said reserve.

The $500,000 deposit by the State is to remain in trust against the issue of said bonds until the reseve fund, as provided for above, has accumulated to the extent of $2,500,000, the $500,000 then to be refunded in the State, and the rest of the reserve fund to become capital stock, and certificates to be issued pro rata as loans were made to the original borrowers or their heirs or assignees, thus incorporating the idea of co-operation.

After the $2,000,000 capital has been established, and if no larger amount than this is required to issue bonds in the ratio of 30 to 1, as described above, the future reserve, after deducting losses (if any) may be refunded at the maturity of the loan of the borrower. The one-half per cent on the face of the loan charged annually should rapidly accumulate a fund, as there should be practically no losses and no expenses.

Loans should be made for amounts not exceeding $10,000, nor less than $250. Preference should be given to loans under $5,000. By utilizing present State banking machinery, the expenses of the bureau should be exceedingly small—not over, say, $12,000 or $15,000 a year. This amount should be added to the appropriation for the State Banking Department until the reserve had accumulated to the $2,000,000 mark. After that period, if the Legislature, so desired, the expenses of the bureau could be deducted from the reserve fund.

Object Sought by Plan

The bureau should have the privilege of utilizing all of the State machinery now in existence. For instance, the Attorney General's office and the county attorneys for attending to matters of titles and foreclosures, etc.

The object sought and gained by the plan is:

(a) To secure for the agricultural classes money on long time at low rates and small partial annual payments.

(b) Economical administration by utilizing State machinery now in existence and avoiding all overhead expenses.

(c) State management and administration, thus surrounding the investor with absolute security and a continuity of policy which State management would bring.

(d) The lack of necessity for payment of dividends on capital stock, or for profit to anyone.

(e) The prestige given by such a State institution would make the bonds salable in all European financial centers, where similar bonds of other nations are well and favorably known and sell as low as 3 per cent.

To make these bonds attract capital and easy of disposal four changes should be made in our State laws as follows:

First—Registration and guaranty of land titles by the State.

Second—An act which would exempt from taxation all rural and land bank bonds and debentures or capital.

Third—A simplified method of cheap and quick foreclosure.

Fourth—All land-bank loans should contain a waiver of all homestead or other exemptions.

The deposit of farm bonds should be made acceptable as surety wherever security or surety is demanded by the State. They should be recognized as legal investments for guardians, trustees, insurance, reserves, etc.

Would Increase Land Use

The above is plain, I believe, along the lines of self-help and, hence, should encourage thrift and the development of our millions of acres of unused, but tillable, soil, as well as for the improvement of the balance of the State, where low rates of interest are badly needed. It would keep the boys on the farms, and would make it possible for large farms to be subdivided through purchase. It would enable tenants to become owners and induce a genuine "back-to-the-farm" movement from the cities, supplying to the city man, who has small capital, additional capital to buy a farm, which he could then operate at a profit.

In addition to all these things, it would place Missouri in the front rank as the pioneer in inaugurating a real, effective farm-loan law. The urgent need of producing food supplies and lowering the cost of living is a matter that concerns the whole population of the State. The State, as a whole, therefore, is justified in inaugurating and putting into motion machinery such as I have mentioned above.

AFTER-THOUGHTS

A group of farmers were standing on the street corner in Columbia a few days ago, chatting about politics, war and mules. They were not dry goods box whittlers, or "hound dog" farmers. On the contrary, they were good farmers and good citizens. As they talked on a prominent local merchant came briskly along and about the time he passed the goup some other man

Free Corn Book and Samples Iowa Seed Corn
I want you to see my seed corn book—it's free, and I throw in samples of seed corn besides.
I have been growing seed corn for over 20 years, and I probably sell more seed corn than any man in the world.
I have learned some things about corn, and this I have boiled down in my seed corn book. You can get my 20 years experience in 20 minutes, and get it a whole lot easier than I got it. If you want seed corn
Ear or Shelled
write for my corn book and samples before you buy. It will be worth your while.
I don't know it all, but I know a few things, and when you see the samples you will say I know good corn.
We sell all seed corn on approval and subject to your own test. We sell it ear or shelled. We test it, grade it, and guarantee it.

Less Work

By using low "Electric" steel wheels on your old running gear or using our
Handy Steel Wagon
Save high lifts, get lighter draft, prevent rutting, save money in repairs—steel wheels do not dry out or rot. Write today for free catalog on wagons and wheels.
ELECTRIC WHEEL CO., 63 Elm St., Quincy, Ill.

stepped up to him and started to talk to him about a business matter—and with quiet but firm emphasis he said: "I haven't time to talk to you now. If it is important you can see me after the store closes this evening."—and with that he cut a bee line across the street to his place of business.

The eyes of the group followed him and then one of them remarked, "Jones is a hustler, isn't he?" "You bet he is" remarked a stockman who plays the cattle feeding game successfully—"and so is every other business man in this town who is getting ahead and I don't mind telling you fellows that I think we farmers could profit by imitating them a whole lot more than we do. Speaking for myself, I know I kill too much time in town. Instead of putting in half the week in Columbia—pretending to have business which I could settle in a couple of hours most any day—I ought to be out on the farm looking after the live stock and a hundred other things. As a matter of fact, the average farmer takes things too easy. We don't stay on the job long enough or hard enough. We swell up and talk about how hard we have to work, but a whole lot of it is bluff. We may pitch in a little heavy during planting and harvest time, but the balance of the time we do a lot of loafing—and all of you fellows know it. We don't begin to get down to our knitting like the average busines man does in town—and if you don't believe it, just step into any good store or bank in Columbia and see. The men behind the counter will smilingly ask you, 'What can we do for you?' in a manner which plainly implies, 'Talk fast, we haven't got any time to kill.'

"Whenever we get down to brass tacks like the average business man does in town—when we try to make every day count out on the farm like they do at their desks—when we put in our surplus time fixing fences, gates or hauling out manure or filling up gullies and a hundred other things that always need to be done on the farm, we'll begin to have better bank accounts. In other words, we need to regard ourselves more as business men and less as just mere farmers."

As he said these things a sort of guilty smile passed around over the faces of the little crowd—and presently somebody remarked, "Well, I must be getting home"—and one by one they silently melted away. Of course, this indictment doesn't apply to thousands of hard-working farmers—but that it gets mighty close to many of the better fixed ones there is little question.

Our New Year's Announcement
A Mogul Oil Tractor for $675

We announce for 1915 an all-purpose farm tractor with 8-H. P. at the drawbar and 16 on the belt

A Small-Farm Tractor for all Farm Work

This new Mogul 8-16 tractor has power to do the work of eight horses.

Being a four-wheeled, all-purpose tractor, you can use it every working day.

It will do all the plowing, disking and seeding.

It will draw manure spreaders, wagons, hay loaders, mowers or binders.

It will run a corn sheller, feed grinder, small shredder, thresher or ensilage cutter.

Any farmer can buy this new Mogul 8-16 tractor for **$675.00, cash, f. o. b. Chicago.**

The man who can use one of these Mogul tractors pays, at this price, the least for which a good, reliable all-purpose 8-16 tractor can be sold.

If you want to use a Mogul small-farm tractor for spring work, your order should be placed now with the I H C local dealer.

Write us for full information.

PRACTICAL FARM PAPERS—No. 3

Those who write for the farm press often have to write articles somewhat out of season; this for various reasons, and I suggest that all who get this paper too late for "hog killin'" this season, lay this article away for next year, as it is the result of long experience.

We shoot our hogs down before sticking, using a 22 rifle, and we scald in a 100-gallon cask, heating part of the water in kettles and part by hot stones. I see several sets of directions for scalding, and must say, that some are written by those who never helped butcher a hog in their lives, one of these being the man who gives 155 to 165 degrees, as the proper temperature for scalding water.

In many years use of a correct thermometer, we have tried all temperatures from 160 to 200 degrees. The first or 160 will loosen the hair on small hogs after a long time soaking, while it is possible to handle a large hog, on a cold day in 200 degree water without setting the hair or cooking the skin, but that hog has to be handled in a hurry. We find 178 to 184 degrees to be just right as at these temperatures we never have to wait long with the hog in the water, over heating the meat, and we have never had the hair to set. Less than 178 is rather slow in loosening the hair, and over 186 brings the danger line of hair setting pretty close unless the hog is moved pretty fast and exposed to the air often.

As soon as the hogs are cleaned and hung up, they are washed and scraped down twice, using hot water the first, and cold water the second time. We remove the entrails just as soon as we can, and in addition to this, we remove the fat from those entrails as soon as possible after they are out. This year we have more than three gallons of this "entrail" fat from four 350 pound hogs, lard as white and with as little smell, hot or cold, as leaf lard. It only took a little care to save this, and a little extra carelessness could have made axle grease out of about twenty-five pounds of lard, worth 16 cents per pound. As soon as all hogs are hung and the entrails out, we tear out the leaf lard, this especially if the day is not very cold, as it hastens the cooling process, and if it should get suddenly very cold, every farmer butcher knows that frozen leaf lard comes out hard.

When there is little or no danger of the mercury going below 24 degrees over night, and if the dog population permits, we allow the hogs to hang out over night, but this year, with almost zero in prospect, they were split down and removed to the store house. Our methods of cutting up pork do not differ much from those of farmers in general. We always wait until all animal heat is gone before cutting and for thirty years have used a saw in all cases as it does not split the bones as an ax does. We trim all meat close, and instead of making the old style round ham that looks so well, we find that by trimming to the new long shape ham, we can take off several pounds of extra fat. The shoulders are cut close to the blade bone, and on the face, as shoulders keep better in lard and sausage than in any other way.

I read an article a few weeks ago in which the writer said that he did not believe any man, who said that he had never lost a joint of meat in curing. Well, I know a dozen men who have not lost a joint in forty years, and with a memory extending back to 1860, I never recall such a loss on this farm. We lay the meat out flat as fast as cut up and sprinkle just enough salt over it to whiten well. In two or three days we pack it in a box or cask, first covering the bottom with pure salt half an inch. Beginning with the shoulders we rub every piece of meat thoroughly, flesh and skin, sides and shank, and keep this rubbing up until the meat has grown quite moist and salt sticks to it well. As each layer is packed down it is covered with salt, and some worked down in the crevices. The bottom of the cask or box should be inclined a little and at the lower edge a few small holes to allow the bloody brine to drain out. Large meat should lie in this first salt two weeks, then be taken up, old salt knocked off and resalted as at first, allowing it to lie ten days the second time. But small meat, say that from 180 to 210 pound hogs, can be taken up to smoke after three weeks lying in salt, no re-salting being necessary. In an experimental way we have used all the widely exploited sugar cures, dry and pickle, and have never found any to make as good cured meat as the plain dry salt process.

We smoke the old way using maple, hickory or walnut wood, the latter being the wood used by the Clay family in making the famed Ashland ham, and before fly time wrap the meat in paper and sack it, hanging in a cool dark room.

C. D. Lyon.

ARE YOU FEEDING WORMS?

Investigation has proved that wormy animals often consume double the amount of food that they should to make gain in weight, and in addition are first to be stricken by dangerous diseases. Hogs are especially susceptible and even though they may have the appearance of ordinary health, they are often loaded with worms.

Many breeders state that worms destroy more hogs than contagious diseases, and it is a matter of record that a million or more lambs are lost every year through stomach worms.

Considering the waste of feed, and the dangers of loss of stock if disease enters the herd, the wise thing to do is to get rid of the worms or they will get rid of your profits.

The Sal-Vet advertisement on page 16 contains a most liberal and unusual offer. You can test Sal-Vet—feed it to your stock for 60 days before you pay a cent for it, in order to prove it is all that is claimed for it. You take no risk whatever in accepting this offer. Sal-Vet is not only guaranteed to rid hogs, sheep, horses and cattle of dangerous worms, but to condition animals so that they will gain faster. All you need to do is to fill out the coupon in the advertisement and mail it direct to The Fell Mfg. Co., Cleveland, Ohio.

EMERSON
Farm Tractor

Model L—12-20 Horse Power

A four-cylinder, 2-speed light weight tractor of great power, suitable for any size farm. Will pull the implements you now have on your farm—gang plows, harrows, mowers, binders, manure spreaders, road drags or graders. Will also operate your ensilage cutter, feed grinder, circular saw, etc. Does more work than horses—costs less and is so simple anyone can run it.

MEAT PRODUCTION ON HIGH PRICED CORN-BELT LAND

Dean F. B. Mumford, College of Agriculture, University of Missouri.

The enterprise of meat production in America until a very recent period has in large measure been based upon the practice of grazing. The total amount of beef and mutton which has been made directly from pastures and forage crops has been greater than the amount of these materials which have been made from all other methods of feeding combined.

This method has made it possible for the American farmer to produce meat at a low cost, and it may be said in passing that for economy of production no method has yet been devised which can compete with grazing on cheap land. But the large grazing areas are being rapidly fenced in farms and grass lands are being plowed for corn, wheat and other farm crops. These lands have rapidly increased in value and while it is true that a large amount of beef and mutton is still produced on grass it is no longer true that these grazing lands are free or extremely low in price.

It is not safe to indulge too freely in sweeping economic generalizations concerning any phase of agriculture at this time. Agriculture and agricultural production is in transition. New conditions and new demands are constantly arising and these require entirely new points of view, and the adoption of new methods. But while we should be conservative we cannot shut our eyes to the progress of events. The facts are that the total production of beef, pork and mutton is falling off in spite of a rapidly increasing demand. There is actually less meat available for human food today than three years ago. The number of consumers has increased rapidly. The methods of slaughtering and curing meats have reached a degree of perfection unknown at any previous period of the world's history. The means of distribution are better than ever before. Every condition is favorable excepting only that of production on the farms.

Why have the farmers of America ceased to produce meat? In the face of an increasing demand and slightly higher prices, improvement in the method of transportation and the general concentration of the meat industry centralized slaughter houses, why have the meat producers found it impossible to continue or expand their business in order to meet this demand? There can be but one answer to this question. **Meat products under present conditions are not relatively so profitable as are other farm enterprises.** If beef products were today as profitable as grain growing there would be no scarcity of beef. This is a very simple answer and I believe is correct, but the reasons why beef production is now relatively less profitable than other farm projects is not so easy of explanation. Still more difficult is it to point out demonstrated methods of production which will insure fairly uniform and satisfactory economic returns.

Beef production may be made profitable either by insuring to the farmer a higher price for his products or by decreasing the cost of production. It is probable that a combination of both methods will be necessary before the enterprise of meat production on the American farm can become re-established on a permanent basis.

In an attempt to analyze the particular reasons which have led farmers to abandon in a large measure the production of meat animals we must recognize the fact that the instability of the market is a prime cause. It has never been possible for the cattle feeder to predict with any degree of certainty the price of fat animals, even three months in advance. The cattle raiser who has been attempting to breed cattle for the market has found it still more difficult to base his operations upon any definite knowledge of values. One of the first essentials for a permanently prosperous meat producing industry is the establishment and maintenance of more stable prices.

The beef cattle raiser must receive a higher price for the finished animal. Under present conditions, the farmer cannot produce beef at a profit. The factors of production have all increased much more rapidly than the price of meat products. The chief factor in beef production is the value of land. Land has doubled in value in a decade. Just how the farmer is to secure a higher price for his products without raising the price to the consumer is a question which is not the province of this paper to discuss. But it may be said that there is evidence to show that if the cost of distribution could be more equitably adjusted, the farmer might receive a higher price for his products without raising the price to the consumer. The farmer is not receiving a fair share of the price which consumers are required to pay for farm products.

It is also true that not all meat producers are following the most economical methods of production. It is certainly true that the practice of many farmers can be improved. Meat can be produced at less cost by employing methods which are well known but not universally practiced.

In attempting to discuss methods of decreasing the cost of production I should like to refer again to a statement made previously in this paper that the cheapest meat produced in America and other sections of the world has been and is now produced on pasture. The Argentine farmers are able to successfully compete with the American farmers because Argentine beef is produced primarily in connection with a system of grazing. This fact is significant, and we may well ask ourselves the question whether or not the value of American lands has increased to a point where we cannot longer consider grazing as a permanent system of agriculture. It is not necessary for us to assume that the highest priced lands should be seeded to grass in order that we may largely increase the grazing area and utflize the areas so developed for the purpose of meat production. It goes without saying that on the highest priced lands grazing must be abandoned for more intensive methods of agriculture. There are millions of acres of unimproved land in the Corn Belt states. At the present time, notwithstanding the high prices received for agricultural products, these lands still remain unimproved. In most cases they have remained in this condition because their cultivation would be unprofitable. Either the soils are covered with brush or timber, are too low in fertility, too rocky or for some other reason they are not cultivated. Most of this land could undoubtedly be developed as grazing land. The prices at which this land can be purchased are generally low enough, so that it would be a profitable venture to develop them as grazing areas. It seems to the writer that one of the most promising fields of agricultural endeavor in the Corn Belt states at the present time is the development of the unimproved areas for grazing purposes.

On the higher priced lands of the Corn Belt region the systems of farming are fairly well determined. The methods of farm organization and administration are rather definitely worked out. Under these systems and methods meat production has declined. If we are to discover methods of decreasing the cost of production on high priced Corn Belt lands, we must look rather to a modification of well established systems than to revolutionary changes. The conservation of our present resources is more certain to result in success than an attempt to discover new and untried methods.

One of the striking facts in connection with Corn Belt agriculture is the enormous apparent waste of corn stover and in some districts straw and other coarse forage. Millions of acres of corn stover are permitted to stand in the field without any attempt to preserve it in palatable form. If this material could be preserved and used for production of meat on the farms it would add very largely to the present supply without largely increasing the cost of our present farm systems.

Corn stover is, however, a coarse roughage. It is relatively innutritious. It is unbalanced and not wholly satisfactory from the standpoint of the best interests of the individual animal. It will, however, maintain animals in good condition during the winter season. The amount of corn stover that is now practically wasted in the stalk fields of the Middle West would successfully maintain in a satisfactory manner millions of cattle during the five months' winter feeding period. This material is the one greatest single asset in increasing the supply of meat products.

A general introduction of the silo in the Corn Belt region would result in materially increasing the supply of meat products. As the result of many years of experience with the silo I think it is a conservative estimate to say that an acre of corn preserved in the silo will on the average produce from 20 to 25 per cent more beef or mutton than will the same area of corn preserved in the ordinary way. A much wider use of the silo therefore would undoubtedly result in decreasing the cost of meat production in the Corn Belt states.

In using the cheaper materials for the production of live stock it will be necessary for us to modify somewhat our present systems of farming. It will also be necessary for us to emphasize the fact that the farmers' problem is not always to provide the most satisfactory conditions for animals, but a more fundamental problem is how to most profitably utilize all of the material resulting from the cultivation of the soil. If we consider his problem from this point of view, it may well happen that the most profitable methods of live stock production may not be those which produce maxium growth of maximum fat in a given period, but rather methods of production which will utilize the cheap, coarse products of the farm.

Instructors in animal husbandry in the agricultural colleges and the agricultural press have emphasized such methods of live stock production as shall result in surrounding the animal with the very best conditions for development and growth. The large use of silage, corn stover, straw and other similar products may not result in producing maximum growth or even normal growth but they may be so utilized in the production of meat that a very large increase will result in the total supply of beef and mutton along with an increase in the profits from farming. In this connection I desire to call your attention to an experiment conducted at the Missouri Experiment Station by Dr. P. F. Trowbridge and the writer, which has an important bearing upon this question. In this experiment two beef steers were used, one of them fed generously from birth to 42 months of age, and the other kept on a maintenance ration from two months to twelve months of age and fed generously until 38 months of age. The steer that was generously fed weighed 902 pounds at twelve months of age, while the steer that was fed on a maintenance ration until twelve months of age weighed only 213 pounds. The animal fed on a maintenance ration for ten months suffered severely from an insufficient supply of food. At the end of the period this animal showed symptoms of starvation. It was necessary to feed more generously to save the life of the animal. It is interesting to note that this particular animal had been subjected to adverse conditions more severe than would be at all usual on the average farm. The emaciated condition of the animal and the clearly insufficient supply of food resulted in stunting the animal.

If stunting the animal early in life destroys its capacity to grow or permanently retards its full development then this animal should have shown evidence of incapacity to grow and of permanent retardation of growth.

The facts are that the animal maintained on a low plane of nutrition when supplied with a generous ration for the second 12 months' period of its life gained 841 pounds in weight in one year as compared with a gain of 500 pounds made by the animal fed on a generous plane of nutrition during the same period. The total weight of the animal on a low plane at 24 months of age was 1054 pounds. The total weight of the generously fed animal at the same age was 1401 pounds. Estimating the prices of food on the same basis the total cost of food for the animal fed on a low plane was

WHY THE AVERAGE FARMER DOES NOT MAKE MORE MONEY

So many factors enter into the consideration of this question that I do not think it likely that any one man can answer it accurately and satisfactorily. However, a summary of all the replies received to this question is likely to prove very instructive.

If I were called upon to answer this question with a single statement, I would say that it is due to lack of training and preparation for the business of farming. For it has truly been said that "A good farmer makes a poor farm better and a poor farmer makes a good farm poorer."

As manager of his farm, the farmer is called upon to solve many widely varying problems; and upon his ability to solve them correctly depends, in a large measure, his success.

"Experience is the best teacher," but the experience of the farmers of a state is worth more than the experience of those of a single neighborhood; and of the world, more than a single state. Failure to study and profit by the wider field of experience is one of the reasons for the small profits in farming.

Each farmer must decide for himself the kind of farming in which to engage; if he decides upon a system that is not adapted to his location, it will not be profitable. Or he may change, without good reason, from one system to another and thus have a lot of worthless equipment left on his hands. Lack of a definite system and plans for long time results often cause loss.

A system of farming that does not provide employment for the owner and help during the entire year may result in smaller profits. Dairy farming gives steady employment, likewise a steady income and the price of dairy products varies less than any other farm products.

The value of Wisconsin's dairy products exceeds the combined value of the gold output of Alaska, California, Nevada and Colorado.

A system of strictly grain farming often forces the farmer to sell his crop at low prices. Much of the 891,950,000 bushels of wheat raised in the United States this year was sold for less than 70c a bushel.

Failing to practice a rotation that includes a legume crop every three or four years, and failing to use lime on land that is too sour to grow legumes, is one reason for small profits.

Not knowing, or not fully understanding all of the conditions necessary for growing maximum crops is another reason.

Loss results from not saving and caring for farm manures; also from not re-enforcing manures with low-priced carriers of phosphorus.

In all systems of live stock farming, training and good judgment show on the right side of the ledger. Many small profits result from giving good feed to animals that are not built for profit. The scrub sire, whether pure bred or a mongrel, is a profit destroyer. Much loss results from not feeding a balanced ration or from depending entirely upon home grown feeds when the same amount of nutrients can be bought much cheaper. Feeding beef or dairy cattle without silage is one way to lose the profits. On many farms much feed goes to waste that could profitably be converted into wool and mutton. This year, on my father's farm, 23 Shropshire ewes brought a gross return of $253.

Some of the factors that make the average farmer laugh at the income tax are beyond the control of the individual but can be controlled by cooperation. Injurious insects cause enormous losses; losses from hog cholera often wipe out a season's profits. Feeds and fertilizers bought at retail come high. Shipping produce without being graded, and shipping on a glutted market result in much loss. Not being able to borrow money, for legitimate productive enterprises, on terms as favorable as those given to the large corporations, results in small profits for many farmers.

Failing to make social conditions in the country as attractive as those in the city results indirectly in small profits. The farmer who gives himself and family no time for recreation will eventually find his profits on the wrong side of the ledger, likewise the farmer who gives so much time to recreation that he neglects the management of his farm.

High Hill, Mo.

HOW TO GET A STAND OF CLOVER

A short time ago I wrote an article for The Missouri Farmer suggesting to my brother farmers to keep more stock and more grass as a means of getting a better return from their land. I will tell you in this letter some of my experiences in securing a stand of clover. In the spring of 1882 I bought a farm on the Two Mile Prairie of Boone County, which is a little heavy and is inclined to "spew" or heave up with both wheat and clover. I decided to sow one of my fields to clover and accordingly I bought some seed. Just as I was starting to sow it one of my neighbors a well-to-do and big land owner came riding by and asked me what I was doing. I told him and he said, "My goodness, John, you are throwing your money away. Clover won't grow on this prairie. Take it back to town and swap it for timothy." Now clover seed was very high and money about the scarcest thing I had at that time, so I quit sowing but in the afternoon I went back to the field and finished sowing the seed.

Fortunately I secured a fine stand. The next year I cut a fine lot of hay and later cut a seed crop of four bushels per acre. My friend who advised me not to sow it bought $50 worth of seed and his son-in-law the same amount.

That was 30 years ago and I have never been without some clover until this year the drouth was too much for it, although I cut two crops last year. I know that my land is better than it was then and raises bigger crops. I have bought but little commercial fertilizer and don't feel it necessary where enough clover is grown. Besides I find clover a paying crop both to cut and to graze. I have had several fields to stand six or eight years but to do this it must not be grazed too closely. The second crop should be allowed to ripen and eaten by any kind of stock thereby leaving much of the seed on the ground. As a hog pasture clover is excelled only by alfalfa.

As to the time of seeding there is great difference of opinion. If I knew the weather would be dry enough to cover the seed in April or May with a harrow I would prefer to sow at that time, but our spring months are often too wet for that and I have adopted the plan of sowing in January or February, allowing the freezing and thawing to cover the seed. There is very little danger of freezing damaging the seed for freezing does not hurt clover seed until the weather is warm enough to sprout it. I have never failed to secure a stand since I adopted this plan, however, last spring's seeding after getting a fine start was killed by the excessive hot and dry summer. For pasture I would recommend equal parts clover and timothy. Orchard grass is good and while it is not relished as much by the stock as timothy or clover it remains green later in the fall and is a little earlier in the spring. I have been trying to grow alfalfa with poor success but I have now a small field that I believe is all right. I cut two crops from it this year and it has gone into the winter in good shape, the ground being covered with a good growth of late grown hay. Clover seed is very high now and many men are refusing to pay the price which I think is a great mistake as a bushel of clover seed can be made to cover more land than any other kind of seed and I don't feel that it is ever too high to justify our not using it for when we buy clover seed we buy fertility and the richest and best feed for young and growing stock.

Boone County.

My Low Prices Will Save You Big Money On Any Size or Style of Engine

Three facts explain my low prices: I have a natural gas well giving free power, heat and light. I share this saving with my customers. I have most modern engine-making machinery, further reducing manufacturing costs to lowest point possible. My entire output sold direct from factory to users saves buyers all dealers' profits—an average of $6 to $20 per horse-power.

WITTE Saw-Rig Kerosene and Gasoline Engines this style

GALLOWAY'S GREATEST SPREADER

Used right now and through the winter is the biggest paying investment of all fall and winter farm work. Means bigger crops next year! You know this yourself! Manure spreading time is all the time. Well manured fields resist drouth; make bigger $-Cash Money-$ profits. This new No. 8 Low Down Galloway Manure Spreader is positively Galloway's Greatest Spreader. The best spreader on earth.
Note These New No. 8 Low Down Features
Double chain drive, endless apron, force feed; front wheels cut under the load; close hitch; lightest draft of any low-down machine. Capacity 60-70 bushels. All steel gear complete with double-trees and neck-yoke. Flexible rake. High speed beater pulverizes and spreads finely and evenly any barnyard material. Steel wheels; gear coupled with heavy channel steel, trussed like a steel bridge. Box rests on rear trucks; 42 inches high at center. Superior in every respect to new fangled freaks of heavy draft that eat you up for repairs.
Spreaders $64.75 UP
K. K. Foust, Ashley, Ohio, says: "I am more than pleased with Spreader. It has proven all you claimed it to be and more. By buying of your company I saved $21.80 and got just what I was looking for."
Send for My Great Spreader Book "A STREAK OF GOLD" Free! Tells all about handling manure to make the greatest profit. Do not buy a spreader of any make at any price until you have dropped a postal asking for this great book and my big Special Spreader Catalog that tells the truth about the Spreader business. Mailed free.
Wm. Galloway, Pres., WM. GALLOWAY CO.
599 Galloway Station Waterloo, Iowa

BOWSHER FEED MILLS
GROW HEALTHY STOCK
Crush ear corn (with or without shucks) and grind all kinds of small grain and Head Kaffir.
Handy to operate—lightest running. 10 sizes: 2 to 25 h. p., capacity 6 to 200 bushels. Conical shape Grinders. Different from all others. Also make Sweep Grinders.
Write for Catalog and folder about the value of different feeds and manures.
T. P. BOWSHER CO.
South Bend, Ind. 30

EIGHT EWES KILLED BY DOGS

The Missouri Farmer:

I have just finished reading the December 1 number of The Missouri Farmer and write to say a few words in defence of your proposed Dog Law. Also to compliment you on the many really good things contained in this number.

I own a flock of 117 ewes, which I keep for the purpose of raising early fat lambs, and have always felt secure from dogs if the sheep were well corralled at night. However a few weeks ago three dogs got into my flock in the afternoon and killed eight head and tore the ears off several more. These ewes were all pregnant, three with twins. Last June I sold my lambs at home for seven cents and they averaged 90 pounds. I also raised over 100 per cent, so you see my possible loss is considerable, and I have paid a heavy dog tax. A few more raps like this would put me out of the sheep business.

I am not the only loser from prowling dogs around here. A man near owned a dog of this kind and this dog went one night a few miles where hogs were dying with the hog cholera and ate what he wanted then brought home a chunk of cholera hog for breakfast. Soon this man's hogs were sick. Another of these prowlers went mad last week and bit a little boy in the face before it was killed. The father of this boy sent the dog's head to Kansas City and the report came back that the dog was affected with hydrophobia, so this father had to hasten to the city to save his boy's life.

Does it not seem strange that these dogs are of more value than our sheep or our hogs or even our boys and girls? For they are a menace to the children who have to travel generally on foot to and from school. Let us have the dog law as proposed. Perhaps it has too many teeth the way it stands and may have to be modified some to get it through.

Right here I would suggest that The Missouri Farmer will tell us just how each member of the Legislature votes when the law comes up. And let us have at least a good dog, pure seed, and stallion law. I could give some examples favoring the pure seed law but I have already spread over to much paper.

J. B. Johnston,
Barton County.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII January 1, 1915 No. 1

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always enclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

We wish you a happy New Year.

—o—

A man to be real happy must be prosperous and to prosper he must be willing to use all the means at his command.

—o—

It is now too late for best results to select the seed corn but it is better to select it now than to wait until spring. Every ear should be tested for germination so the farmer may know he is planting good seed.

—o—

How many of our readers know how much profit they made last year? Whether it was profit or loss it would be real interesting to know how much it was and what caused it. Right now is a good time to take an inventory of what you have and what you owe and at the end of the year you will know whether it is loss or gain. A little bookkeeping would show what caused the loss, may be, and then you could cut that item out next time.

—o—

There has been a whole lot of progress in farming in a hundred years but there will be more advancement in the next century. The Indian could make a hole in the ground with a stick and plant his corn but he did not expect much corn. When the Indian's corn failed he got his living fishing and hunting but we have past that period. We have better seed and better machinery to work with than the Indian had but we are cultivating the same old soil and most of it is a whole lot poorer now than then. Our future success in growing crops will depend upon our ability to make the soil richer, to improve the varieties of seed and to learn how to work the soil to best conserve moisture and fertility. Farming in the future will be a full sized man's job and only the fellow who is willing to accept the best of the world's discoveries can hope to succeed.

—o—

When the local road officers are not doing their full duty it is a good idea for the neighbors to get together and talk over what is needed in the way of better roads for the district. It will work wonders for a few men to go before the township board or county court and ask that the road money be spent intelligently. It will help if the delegates are ready to say to the officers that the local community is ready and waiting to co-operate for better road work. Few road officers will ignore a petition of this kind. We are spending a lot of money on Missouri roads that is not doing anybody any good, at least, it is spent in a way that we get no lasting benefit from it. Suppose the readers of The Missouri Farmer resolve that for the year 1915 they will use their best efforts to get a dollar's worth of work done for every dollar spent on the road. In order to do that the first step is to stop building wooden culverts. Cement culverts cost a little more but when built right it is for all time to come. Three years ago one district started along this line and today one hundred and fifty culverts have been built and only about thirty more to build then that expense will stop. Other districts can do as well if they will just make the right start.

—o—

Another matter that might be put under good headway by a very few people for the great good of most country neighborhoods is the movement for a rural high school. For a long time farmers thought a good high school in the country was impossible but in a great many places they are proving it can be done and we are pleased to say several of these places are in Missouri. It is a big expense for many farmers to send their children to city schools, and then anyway the city school is not always the best place to send a country boy or girl. As a consequence not many of the children from rural districts get to go to school farther than the eighth grade. The remedy is the rural high school where the boys can keep up their farm experiences and the girls have the protecting influence of home training while getting their high school work. The state Legislature will appropriate a lot of money this year for various purposes and if those interested in the rural school would have a rightful share of the money go to the support of rural high schools they must make their influence felt when the Legislature meets. The University and the normal schools have their budgets already made up and they will not be stingy about what they ask for. We are not offering any criticism for the boards governing these state schools for asking for money for extensions, improvements and support because these great school are a necessary part of our educational system. The schools that train the teachers for high schools and rural schools ought to be made the very best but while we are doing that we want to see the poor man's school keep pace with them. The last Legislature made a splendid start in giving aid to weak country schools and for rural high schools and the farmers should be just as ready to demand improvements for these schools as the boards are for the higher schools. The Legislature will appropriate all the money in sight, so it is necessary that we take an active interest and let them know what the people really want in order to get the best use of our own money.

In all matters of this kind it is better and will be more effective if neighborhoods will get together and discuss these questions and agree among themselves before the appeal is made to the lawmakers. It is better to act now than it will be to remain silent and criticise your member of the Legislature after it adjourns.

It is time now to begin to think about your supply of seeds for the spring crops. We have repeatedly shown that it pays to sow only the best and heaviest oats but how many of our readers select their oats any other way than with the scoop shovel? In our issue of February 1 we will discuss the best methods of oats seeding and will appreciate a report of any successful plan our readers may have used. What have been your results with drilling, broadcasting, disking and with using the fanning mill and treatment for smut?

We would like to have the experiences of our readers who have succeeded in making money out of poultry. When the poultry product of the state reaches the grand total of $50,000,000 a number of people must be making it pay and the nice thing about it is the more people we have who make the business pay the better will be the business. That is why we want you to write us and tell the readers of The Missouri Farmer how you make money out of poultry and eggs. Here is how it helps you: Your articles give you a wider reputation, and will help to advertise the poultry business of the state. The bigger our business the more competition in buying and if our product is first class it will soon command a premium.

A WORD TO OUR READERS

When we commenced the publication of The Missouri Farmer six years ago, we started out to give the farmers of this great state what they had never had before— a high class farm paper **of their own,** edited by Missourians who have a first hand understanding of Missouri farm needs and conditions. For years the farmers of Missouri had been without a publication of this kind—and they had to depend upon farm papers published in other states which often advocate ideas not suited to Missouri conditions. Every great Agricultural state needs a great Agricultural paper, which is exclusively devoted to the upbuilding of its crop and live stock interests—a paper which is ably edited, which understands the peculiar problems which confront its readers and which stands out squarely for progressive methods in every department of Agricultural activity. It would be impossible to measure the good which such fine farm papers as Wallace's Farmer or the Ohio Farmer have done for the farming interests of Iowa and Ohio—for these splendid publications are found almost universally in the progressive farm homes of those states and it is this state loyalty and support which made it possible for them to develop into the great publications they are today.

That the Missouri Farmer is beginning to fill this field in a powerful way in Missouri—if the hundreds of commendatory letters we receive are a true criterion is unquestionably true—but what we need at this time is the support of **every one** of our readers and to this end we appeal to **you** to send us a dollar bill at our risk for three years subscription **by return mail!** On January 10th, we will send out a letter to every reader whose subscription is in arrears and if we receive your remittance before that date it will save the postage for us and the annoyance to you. To this end, whether you originally subscribed for the paper yourself—or whether some friend sent to to you **—please send us your renewal promptly**—or, if you don't care to receive the paper any longer, drop us a postal card when we will stop it, for we do not wish to force the paper onto anybody.

For sometime, Mr. Ellis, the Managing Editor, has been conducting an inquiry on "Why Doesn't the Average Farmer Make More Money?" —and during the balance of the winter we believe this inquiry will develop into the greatest discussion of the kind that has ever appeared in any farm paper in the Country—and since it will be participated in by many of the most successful farmers in Missouri who will tell their views and experiences in their own way we feel sure that every thinking reader will find The Missouri Farmer more than ordinarily interesting during January, February, March and April when it will be devoted very largely along these lines.

The great European war will perhaps produce the highest price for the products of our farms during the next year or two that the American farmer has ever known—and if there ever was a time for the farmers of Missouri to try to make the most of their opportunities it is **now!** If there is a mortgage that is worrying you, you will never have a better chance to pay it off than during the next two or three years—and that The Missouri Farmer will be able to contribute substantially toward your success if you will give it an untrammeled opportunity there is little doubt.

The Missouri Farmer is preparing to make a powerful fight before the coming Legislature for a Farmers' Land Bank which will give the farmers of this state an opportunity to borrow money at lower interest rates and on a long time amortization plan. Are you not keenly interested in this question? So, too, it will urge a number of other matters vitally important to farmers generally. As a thinking farmer, can you afford to be without the paper which **leads** in these matters in Missouri—especially when it only costs you 33 1-3 cents a year?

Furthermore, The Missouri Farmer tries to stand in truth for "Better Farming," "Better Farm Homes," and "Better Citizenship." It breathes a sentiment of hope and tries to point the way to the finer and loftier things of life—as well as to give reliable information on all pertinent farm subjects. The things it stands for are good and wholesome for your son and daughter—for everyone who wishes to get not merely the highest profit but the greatest happiness out of farm life. It is our desire to build up a "Big Missouri Farmer Family"—a bunch of men and women who stand for the best there is in the rural life of this great state—and we need **you** in the circle. We have great plans in hand for 1915—but we need **your** help. To this end, please send us a dollar bill by **return mail!** The label on your paper tells when your subscription expired. Thus, if the label reads Nov 14, it means that your subscription expired in November 1914. **Surely every progressive farmer in this great state should take the only real Missouri farm paper published in Missouri!**

With best wishes for a happy New Year for you and yours, I am for "Big Crops" in 1915.

WILLIAM HIRTH, Publisher,
THE MISSOURI FARMER, Columbia, Mo.

P. S.—Be sure to send in your renewal before January 10.

BUCKSHOT BY THE PROFESSOR

Here's to you and yours during the year that is to come.

With greens to pull me through the summer and rabbits to feast on in winter the "high cost of livin'" can go way back and sit down so far as I am concerned.

If self binders, cultivators, plows and harrows could talk, the things a lot of them would be saying these wintry nights wouldn't sound well at a prayer meeting.

Some men take better care of their horses than they do of their families. Then there are a lot of others who don't take any care of their horses or families either one.

Old man Zero has my consent to do his worst. I'd rather have my bunions go on a strike than to have to fight army worms, hessian flies and chinch bugs all next summer.

When you see a farmer lugging home packing house hams and bacon you can bet your hat that he's one of the kind who insists that there "ain't no money in farmin'"—and there isn't for the fellow who sells hogs at 7c and buys them back at 25 and 30 cents.

Bears never work during the winter time. They eat a lot in the fall and then curl up in a hollow tree or a cave, go to sleep and don't wake up till spring. A lot of farmers "curl up" and quit working in the winter time too—but the trouble of it is they don't stop eating.

It takes a lot of different kinds of people to make a world sure enough. For instance, I saw some men arranging with Santa Claus to deliver kitchen cabinets, new bed room suits, dinner sets, furs, etc., as Christmas presents for their wives. Then I saw some others who were lugging pasteboard boxes which looked like they might contain about a gallon of "personal liberty."

Here's a happy New Year for mother, the kids and the "old man" who, for all his faults, is the salt of the Earth—for it's up to him to keep up the interest on the mortgage and to provide coffee and sugar and shoes and clothes for the whole bunch. May the New Year be full of happiness for all of you and may the local pill distributor have to "take to farmin' for a livin'" is my ardent wish.

Let's put in the long winter evenings from now on by doing a lot of reading on better farming methods. Let's see if we can't knock a big hole in the mortgage next year. The foreign war is going to mean a big price for everything the farmer produces—but unless you produce a surplus beyond your own needs it won't do you any good. So let's roll up our sleeves and see what we can do.

Here's hoping that old Santa Claus didn't forget mother at "you all's house"—mother who is usually the first one up in the morning and the last one to bed at night—mother who is never too tired to soothe your aches and mine—to speak kindly words of encouragement when others frown—mother who does more to make the World truly beautiful than any other single influence in the universe.

Suppose, among other things, we start into the New Year by sending The Missouri Farmer a dollar bill for three years subscription? Ought not all of us take pride in building up one fine, big Missouri farm paper? Certainly a paper like The Missouri Farmer is worth the small sum of 33 1-3 cents a year? You can get that much good out of a single issue if you try. If all of us would send the paper a dollar it would be a mighty fine New Year's gift—and I know the Publisher and Editor well enough to know that they would then give us one of the greatest farm papers in the Country. Now suppose we all do this today—for when we put a thing off we frequently forget it altogether.

A Telephone Pays—Every Hour

It pays in MONEY. It pays in PLEASURE. It pays in TIME SAVED. Put in a telephone, and you can talk to your friends' homes in the evening for a social chat, or get the doctor *quick*, or call for help. You will never feel lonely or "away off" if you have a telephone. In the daytime you can call up the town and find out latest prices for crops, order supplies, ask the railroad about shipments, or talk over matters with neighbors. Why be isolated, cut off from everybody, when a

Western Electric Rural Telephone

will put you "next door" to everybody, and save long drives through cold and wet. A FEW DOLLARS buys all this convenience. A FEW MINUTES' TIME taken to write us on how to secure good telephone service will put you in possession of full information. Write nearest house below and mention this paper.

WESTERN ELECTRIC COMPANY

EQUIPMENT FOR EVERY ELECTRICAL NEED

JERSEY CATTLE BREEDERS MEET

The Missouri Farmer is pleased to see the progress that has been made by the Southwest Jersey Cattle Breeders' Association which body held its second annual meeting in Kansas City on December 19. Space forbids a complete report of the meeting but the following summary is given: The association urged generous support for the State Dairy Commissioner's office and recommended the plan of putting in operation local co-operative dairy associations. Also expressed the appreciation of the association for the work E. A. Ikenberry, county farm adviser of Jackson is doing in organizing cow testing associations. It is proposed to hold a dairy exhibit in connection with the American Royal Live Stock Show in 1915. The association favored the passage by the next Legislature of a pure seed law, a state statistical law and a law regulating the sale of commercial feed and condimental stock foods.

The association includes in its territory all territory adjacent to Kansas City and there is no other place in the United States better adapted to dairying than this section. In the heart of the grain belt and the alfalfa center, with splendid pastures and good water and a mild climate and good markets, what more is needed except that the farmers of this territory shall be awakened to the opportunity for money making both in producing dairy products and in breeding dairy stock?

The trouble is we have depended too much upon individual effort and not enough on co-operation and we are glad to see this association take the lead it has for organizing the dairy work. The president of the association is M. M. Sweetman and the secretary, J. M. Axley, Kansas City, Mo.

ROYAL KEROSENE ENGINE

An Engine For The Farm, Mill, Elevator, Lighting Plants, Etc.

Manufactured by one of the oldest, largest, and best manufacturing firms in U. S. Every part made of best materials and tested in our own factory. Every engine passing factory test must show liberal margin over rated horse-power.

Simple to Operate. No intricate parts. Mechanically-operated, vertical valves, and high-speed, self-oiling and ball-bearing governor insures greatest economy in fuel consumption.

SIZES: Kerosene, 3 to 25 H. P. Gasoline, 1 to 25 H. P.

Investigate the Royal before buying. If not at your dealer's, write for printed matter direct from factory.

SMITH & SONS MANUFACTURING CO., 1538 Guinotte Avenue, Kansas City, Mo.

Will Pay Reliable Man or Woman $12.50 to distribute 100 Free pkgs. Perfumed Borax Soap Powder among friends. No money required. L. Ward & Co., 208 Institute, Chicago.

Light Weight Cushman Engines For All Farm Work

Engine weighs only 190 lbs.

This Light Weight Cushman Truck is so handy for all power work. So light a boy can pull it around from job to job, yet it easily handles all work up to 4 or 4½ H. P. **Runs at any speed** desired, speed changed while running. Pump circulation to water tank prevents overheating, even on all-day run. All Cushman Engines are

Throttle Governed—Steady and Quiet

No jerky, explosive hit-and-miss running. They are the **most useful engines** for farm work, as they do everything the big fellows do and so many jobs big engines cannot do. May be attached to binders and other machines as power drive. Equipped with Schebler Carburetor and Friction Clutch Pulley. **Not a cheap engine**, but cheap in the long run. Sizes 4 to 20 H. P.

Before buying any engine, better investigate light weight engines. Ask for free Engine Book.

CUSHMAN MOTOR WORKS

LINCOLN, NEBRASKA

READ OUR ADVERTISEMENTS

Read the advertisements in The Missouri Farmer carefully for they deal almost altogether with things designed to make farming easier and more profitable. Write to the advertisers and ask them to send you their literature. A postal card will bring it to you—and nearly all of it contains information of great value. An up-to-date farmer needs up-to-date tools and implements. It is one way to make up for a lack of farm labor. We guarantee every advertiser in The Missouri Farmer to be honest and reliable—and stand ready to protect our readers in this respect. If they were not reliable you wouldn't see their advertisements in The Missouri Farmer. Never fail to mention the paper when you write to an advertiser.

WILLIAM HIRTH, Publisher,
THE MISSOURI FARMER.

Good Holstein Bull Calves

If you are looking for something good in high grade Holstein bull calves better get in correspondence with D. D. Moss & Son of Columbia, right away. The calves they are offering now are out of their fine young bull, a son of the best Holstein cow on the University farm and they are from Josephine bred heifers of very high grade. This is your opportunity—look up their ad and write them.

What has been your experience with the silo? Has it been a paying investment for you? There are several thousands of dollars, possibly millions, invested in silos in Missouri and a great many farmers have written us that they pay. What have been your results? Won't you tell us all about it for the benefit of your fellow farmers.

A STALLION REGISTRATION LAW

E. A. Trowbridge, Secretary Missouri Draft Horse Breeders' Association

The first Stallion Law in the United States went into effect in the State of Wisconsin on January 1, 1906. The law was the result of a keenly felt need on the part of the close students of the horse industry in that state. It was thought to be a means of bringing to common knowledge among horse breeders, farmers and dealers a better understanding of market demands, better methods of breeding and closer knowledge of the type of horses. Thus its prime object is seen to have been educational. It had, however, another purpose—namely, the prevention of fraud in selling and advertising stallions.

This law was different from any that had ever been passed in America. It was different from any European horse breeding legislation, yet it was believed that its general effect would be to create an increased attention and give impetus to the industry such as government regulation has been observed to give in France and some other foreign countries.

The law has been in force since its enactment and its general provisions are:

1. Requiring an inspection of breeding and certificate of registry by the Secretary of Registry Board, of all stallions and jacks stood for public service.
2. Requiring an inspection for soundness of all stallions or jacks standing for public service.
3. Requiring the enrollment of all stallions and jacks standing for public service with the Registration Board together with record of their condition of soundness and breeding.
4. Requiring the issuing of an enrollment certificate for each stallion or jack, stating on face of same his description including his condition of soundness and breeding.
5. Requiring the classification of all horses and jacks as Pure Bred, Grade, Non-standard, Cross-bred, and Scrub.
6. Requiring the entire elimination from public service of horses and jacks affected with certain transmissible or communicable diseases.
7. Requiring the posting of copies of enrollment certificate on doors of stables where animals stand and copies of same in all advertising.
8. Requiring the recording of enrollment certificate with Recorder of Deeds in county where animal stands.
9. Penalty for violation of law.

The results of this law have been gratifying. The horse industry has been greatly improved. The number of pure bred and registered stallions has grown from 1067 or 35 per cent of total in 1907 to 1774 or 55 per cent of total in 1913. The average price of horses has risen from $107 in 1906 to $131 in 1913. This increase in price cannot be entirely credited to the operation of the law, yet it has had its effect. Over and above this, many cases of fraud have been discovered. Horses sold as registered in some cases have proven to be grades. Horses have been discovered with other horses' certificates attached to them.

The law has proven a good business proposition for stallion and mare owner alike, and for the state as a whole.

Stallion owners have been placed in a position to know whether the horses they were buying were as represented. Fraudulent pedigrees have been traced to their original source and damages secured in some cases. Men selling stallions in that state have realized the condition and do not try the questionable practices used by a few dealers in years past. The owner of the good stallion has been aided by having inferior horses labeled for what they really are. Mare owners have been able to see and study the breeding and other important features of the stallions in their locality and to intelligently select stallions for use on their mares.

The state has come to occupy an enviable position as one of the best horse producing states in the Union, a statement which could hardly be made of it ten years ago.

This law proved so satisfactory in Wisconsin that over a dozen states have since enacted such laws. The dozen states mentioned include practically all the Corn Belt states, namely: Wisconsin, Illinois, Indiana, Ohio, Iowa, Minnesota, Nebraska, Kansas and several far-west and far-east states.

These laws have varied in their provisions and have in some cases met with some opposition but generally the results have been satisfactory. It is generally conceded that the Kansas law is one of the best laws in operation. This law was written with the idea of having for its greatest result a better understanding by all of the types of horses and methods of breeding. This result has been noticeable in the extreme. It has also been the means of locating some men engaged in unscrupulous practice and in preventing their perpetrating further fraud on the people of Kansas. The approve the law and its effect.

Most Progressive Horsemen of Kansas

While the effect of laws in the above named states has been to prevent traffic in misrepresented horses, it has not entirely eliminated this class of horse dealers. On the contrary they have simply turned to states not having laws to hinder their fraudulent practices and redoubled their efforts. One dealer is said to have even gone so far as to write to a seceretary of a Registration Board in a neighboring state asking for a list of owners and addresses of affected horses with the statement that he had "a trade" in another quarter of his selling territory that called for this class of horses. This list, however, was not sent. Intimate acquaintance with the Wisconsin situation in 1906 gave the writer knowledge of at least a few "bad" horses that were sent across the border into neighboring states where they might be used without being molested. They were soon driven elsewhere, however, for these adjoining states soon had laws.

Missouri at the present time is bordered by states on the north, east and west, namely: Iowa, Illinois and Nebraska and Kansas—all of which have laws in operation. It would naturally seem that to some extent our state would serve as a "dumping ground" for the unfit horses, and reliable horsemen and others in close touch with conditions inform us that we have no idea of the fraudulent pedigrees and inferior horses being sold into our state.

In one particular case the writer saw a black three-year-old stallion sold through a public sale purported to be a registered Percheron, while a casual inspection showed his certificate of registry to have been issued by another and much less reputable organization.

Stallion laws to suit Missouri conditions have been discussed in the past. It has been pointed out that such a law would be of great eduactional value and would furnish an opportunity for breeders and horsemen to know more about the conditions in the state. It has also been suggested as a means of preventing some of the fraud which is reported to take place in this state.

Missouri is one of the best horse breeding states in the Union. The foundation stock and the opportunities are here to make it the greatest horse breeding state, when all classes of horses and mules are considered, but in order to realize this opportunity, careful methods and keen judgment are necessary. A most thorough knowledge of conditions will be essential to the greatest success in Missouri.

The Missouri foundation stock, which is the development of the saddle horses and harness horses, is second to none. The Thoroughbred, Trotting and Saddle horses have left a wonderful stock of mares in this state. The foundation stock which we have has already proven to be the greatest mule producing stock in the world. While Missouri does not have so many draft horses as some other states, there is no good reason why we cannot raise as good draft horses as can be produced elsewhere. Our climate is not excelled in the United States for horse production. Our people are horse lovers and our system of agriculture makes possible the economic use of young horses.

The most imminent need of a stallion law is, (1) to give the people of the state an exact knowledge of conditions as they exist; (2) to turn attention to this line of agricultural production; (3) to encourage the use of only good males for breeding purposes; (4) to locate the unscrupulous dealer and make it necessary for him to cease questionable practices.

It is not necessary that the law be drastic—in fact it seems advisable that it be quite the opposite, but that some sort of a law is necessary is quite evident. Surrounded on the North, East and West by states having laws, the State of Missouri together with Oklahoma serves as a "dumping ground" for horses not fit for use in these other states.

A Stallion Law can not be enacted unless the people of the state favor it. Such a law if properly constructed should work for our profit and for better horses and no one should take greater interest in it than the farmers and horse breeders of this state. The better our horses are the better our reputation will be among horse buyers and therefore more buyers will come into the state and better prices will be paid for what horses we have to sell.

Have you found some crop that makes you money? Write us your experience that we may pass it on.

Managing the Business of 8,500,000 Telephones

Imagine a manufacturing business having millions of customers scattered over the country, with millions of accounts on its books, most of them less than $30 a year, and including a multitude of 5-cent charges.

Consider it as having shops and offices in thousands of cities, and reaching with its output 70,000 places, more than there are post offices in the United States. Think of the task of patroling 16,000,000 miles of connecting highways constantly in use.

This gives you a faint idea of the business of managing the Bell System.

Not all the 8,500,000 telephones are in use at once, but the management must have facilities always adequate to any demands for instant, direct communication.

In so vast an undertaking, every branch of the organization must work in harmony, guided by one policy. The entire plant must be managed in the light of accumulated experience, and with the most careful business judgment.

The aim of the Bell System is to make the telephone of the utmost usefulness. This requires an army of loyal men and women, inspired by a leadership having a high sense of its obligations to the public.

Animated by the spirit of service, and unhampered by red tape, the 150,000 Bell employes have the courage to do the right thing at the right time upon their own initiative. They work together intelligently as a business democracy to give the public good service.

THE SHEEP AND THE DOG

To The Missouri Farmer:

I have been through the fire from every angle concerning legislation for the protection of sheep from dogs and am still ready to do my best for the best interest of all.

Your proposed bill as published in the December 1 issue is drastic and I think perhaps it is best to have it so to start with because it will be easier to modify it by eliminating some features than it will to make it more drastic.

I am sure if you should get the sheriff onto the job he would lie down on it and would be worthless, as you know the prosperous dog man is the best politician and the man of affairs is a poor man to work for a man at the polls.

The dog law that is going to be a success will be the one that will be worked as any other law relating to live stock. That is how many dogs have you on this farm? and no mention of the amount the taxes will be collected, but will sort of slide by as a piano, a wagon, etc. I would have it collected with the general taxes and make no mention of places to collect this dog tax. If the books are kept separate there is a general fight in the minds when the published collections come in and the dog man, which is every farmer, is hurt when he sees how much he has contributed to the fund while if the incident closes when the assessor passes the dog problem is solved and the poor dog will be kept down to a minimum. With the present dog songs and eulogies on dogs you certainly have my prayers to even mention dog laws, but still it is a good thing to talk about in the press and by constant agitation we may make it clear to many that the other fellow's dog is a menace to good farming. But still "my dog is O. K." It is the other fellow's every time.

Having been through the fire from all sides on dogs and dogs and sheep, it is unsafe to put the lime light on the dog on assessment day and settlement day. Thus you can see I would be opposed to setting aside a fund for losses on sheep as this would be and is considered class legislation. Besides an honest oath as to losses by dogs can hardly be obtained.

Should I mention to my neighbor I was needing a dog to drive hogs and the like each one would gladly give me his dog. But should the assessor, sheriff, deputy or I shoot this dog he would be a $25-dog and he would rather have the best horse on the place to die than to lose that dog.

I have handled sheep with an actual count of 524 dogs within a radius of three miles of my farm and find if the gun barks at a dog, every man, to a man, goes mad at you, even the man that refuses to feed the dog. So I take care of my sheep and stand my losses and don't mention it to the neighbors. Neither do I kill his dog by any means as through some channel he will find it out and he will hold it up against me as long as he lives in the neighborhood.

The farmer can not afford to lose a single neighbor even if he is seriously run over.

I am still in the sheep business and have for years yarded them at night and use bells on the sheep to attract attention. These bells are the small cow bells 2 x 3 inches at the mouth with an old piece of a harness tug for a bell collar. This collar is riveted just large enough to slip over the head when shearing time comes and being wide does not chafe the neck of the ewe. I have two dozen of these bells and when the stray dog passes this noise is simply more than he can stand for and be funny and so we at the same time take notice of his presence.

I consider the dog menace to sheep industry only a small one in the state of Missouri at the present time, even take off hog cholera, with loss from sheep raids. The dog is a night prowler by nature and very quiet all day. In fact if only neutral dogs were kept we would be in a manner safe. I find they are as tractable and watchful as an entire, besides they do not care for companions at night.

The operation is easily performed with no bad results as we know from experiment.

The dog in the picture is now nine years old and was made neutral when a pup, also his tusks were sawed off as he would tusk the pigs hams, and I would not stand for that. This boy can send this dog for the horses by clucking or for the cow by calling "hay Tray drive her up," or "shoo them up" for sheep, or hogs "suboy."

In fact I dont' know of a dog that will do more intelligent work and more courageously than this sterile dog. Just last week he showed his teeth to the tramp that stood at the gate while the mistress refused a hand out. E. E. Laughlin, Bates County.

The Dog and His Master

MEAT PRODUCTION ON HIGH PRICED CORN-BELT LAND

(Continued from page 6)

$76.31 for the 24 months' period. The total cost of food fed to the animal on a high plane of nutrition was $121.44 for the 24 months' period. The cost of each pound of live weight on the low fed animal was 7.2 cents per pound. The cost of each pound of live weight for the generously fed animal during the 24 months' period was 9 cents.

The important teaching of this experiment is that an animal maintained on a very low plane of nutrition during the first few months of its life does not lose the capacity to grow. The animal fed on a low plane of nutrition made larger gains for the same food and therefore at less cost than did the generously fed animal.

Attention is called to this experiment in this connection for the purpose of suggesting that we may maintain very large numbers of animals on straw, corn stover, or coarse roughage materials which have very little economic value, and we may do this without destroying to any considerable extent the capacity of animal to grow. It is not essential in beef production that all beef animals should be fed generously from birth. It is easily possible that our methods of beef production may be so changed that a considerable live weight may be secured by the feeding of a very cheap class of food stuffs.

Another important factor in the economics of meat production which must be taken into account in the discussion of the general problem is the comparative efficiency in the utilization of food of the meat producing animals. There is some difference in the nutritive value of beef, pork and mutton for human food, but the difference is relatively small and excluded from consideration because of palatability. We may assume that for all practical purposes a pound of pork is as efficient for human nitrition as is a pound of beef. A pound of mutton likewise is also essentially as valuable for human food as is a pound of beef.

If it is true that these materials have practically the same nutritive value then, other things being equal, the variety of meat which can be produced for the least cost on the farm will be favored in the adoption of methods of farm management which aim to supply the demand for meat.

With the methods of beef production which have prevailed, a pound of beef is produced at greater expense than any other meat product on the farm. It is of course very difficult to give an average figure which shall cover the food requirements for producing a pound of beef under varying conditions. But we will not be far wrong if we estimate that for the production of one pound of beef there will be required from 8 to 10 pounds of grain and 4 or 5 pounds of roughage. For the production of mutton there will be required 5 or 6 pounds of grain and an equal amount of roughage. For the production of pork we may safely estimate that 5 pounds of grain will produce one pound of pork. In pork production roughage or forage may be disregarded in this estimate, or, if pork is produced on forage crops, then the grain requirement included in above estimate may be materially reduced.

The area of land required to produce 100 pounds of pork or mutton is materially less than the area of land required to produce the same amount of beef. If the demand for food becomes more insistent and the requirements for greater production increase, then the farmer will more and more produce those meat products which require the least consumption of food.

In many phases of animal production the costs may be greatly reduced by selecting the most efficient animals. It is a well known fact that some cows will consume a certain amount of feed in a year and produce 200 pounds of butter. There are other cows that will consume approximately the same quantity of food and produce 250 pounds of butter. If the higher producing cow consumes more food the relation of the food consumption to product will be in favor of the higher producing cow.

There are some horses that will consume a given amount of food and from this food will be able to extract energy of an amount and kind that will make it possible for the animal to trot a mile in two minutes. There are horses that will consume the same kind and amount of food and will be able to extract energy therefrom sufficient to make it possible for them to trot a mile in four minutes. In these examples, there is no difference to be noted in the food consumed or in the training which is received. The difference in the amount of product is due entirely to a difference in the efficiency of the animals. It is very plain that the cost of production may be greatly increased in these cases by breeding and selecting more efficient animals.

Is it possible for us to decrease the cost in meat production by similar means? Are there great differences in the efficiency of meat animals?

It must be said here that so far as our investigations go at the present time there is no very great differenec in the efficiency of meat producing animals so far as their ability to produce a given quantity of produce from a fixed amount of food is concerned. A scrub steer may produce as many pounds of beef from 107 bushels of corn as the well improved shorthorn, Hereford or Aberdeen Angus. The greater efficiency of the higher improved meat animal is not due to the fact that they produce more product from a given amount of food but that the product is of higher value. The well improved meat animal is not due to the fact that they produce more product from a given amount of food but that the product is of higher value. The well improved meat animal is able to improve the raw products of the farm and produce therefrom a product which sells for a much higher price on the market. It is clear therefore that the feeding of a better class of meat animals will result in decreasing the cost of production.

In conclusion, from the writer's point of view, the methods which are likely to result in decreasing the cost of meat production and thereby making it possible for the farmers of the Corn Belt region to produce meat animals on high priced land are to be found in developing unimproved areas of land for grazing purposes; by utilizing the by-products of the farm, particularly coarse roughage such as stover, straw and cheap hay; by the general adoption of the silo as a means of preserving corn and other crops; by feeding more sheep and hogs because of the well-known efficiency in the utilization of feedstuffs; and lastly, by the selection of more efficient meat animals.

Let KODAK

Shorten the Winter Evenings

The fun of flashlight pictures, of developing and printing—all without a dark-room—is well worth while.

GASES IN A SILO

Silos should be ventilated before being entered. The Journal of the American Medical Association cites a story of four men who were killed by carbon dioxide after entering a silo at the State Hospital, Athens, Ohio, last September. The men entered by a door well up on the side of the silo and jumped down to the surface of the silage six feet below. Two other men who were about to enter the silo a little later, discovered the four in an unconscious state. Assistance was immediately called and though physicians were at hand when the men were taken out, they could not be resuscitated. Accidents of this sort are infrequent, but men who work in silos should be careful to take no risks with gases that may have accumulated over night or during a considerable period in which the silo has been closed.

Stark Delicious Always Shows a Profit

The "greatest apple in the world" tops the market. There's satisfaction in growing it, because of its unequalled quality, and money, because of the demand for it. The man who has an orchard made up largely of Stark Delicious worries less about his other crops. The practical fruit grower knows that he has a reliable money-maker in Stark Delicious. Give it a place in your orchard right away. Write quick for New **Wholesale** Catalog showing Stark Delicious, Stark Early Elberta, and all fruits and ornamentals. Address

POULTRY THOUGHTS

Why is it that all of us do not succeed in getting pleasure and profit from the breeding of fowls? There may at times be good reasons why some of us are held back temporarily and in some cases permanently, but we doubt if there is any good excuse for complete failure except in few cases. We like to see people succeed in this world, if their undertakings are commendable and if we can encourage some reader who needs it and can help him to see and embrace his neglected opportunities, we will indeed be pleased. Each season of poultry shows, which at the present time are being held in almost every state, brings its share of disappointed breeders, those who have put forth their best efforts to produce birds that will win the coveted honors, but who have had to be content with a place in the rear. The fact that they have tried and failed depresses many of them more than if they had left their birds at home and shared the poor consolation of the fellow who never tries. We do not believe in any such policy. It is much better to try and fail than never to have tried at all. And the man who does not have that principle deep-rooted in him will never rise above the crowd, no matter what he undertakes. Your motto should be, "Where others give up is just where we get our second breath." It is the staying kind that knows no defeat which make the leaders in any line of endeavor. The world applauds him who realizes his aim. The trouble with most people is they are not willing to properly study their birds and the problems of mating. They expect to duplicate the results of the earnest, painstaking breeder without employing his method. If you were to read all the literature published on poultry husbandry you would still have a chance to learn something new every day. You must have the experience to be successful. Theory is all right as far as it goes.

E. L. Andrews, Maryville, Mo.

THE INDIAN RUNNER DUCK FOR PROFIT

The Indian Runner ducks are not so extensively raised by farmers as they are by the city man who raises a few fowls for pleasure and to supply his table with eggs and meat.

The casual observer seems to think they are for the fancier and only to be considered as show birds, when in reality they should hold an equally prominent place with the Missouri hen. The fowl that is easier handled or raised than the Indian Runner duck is not to be found, and as egg producers they have no equal. With a little extra care they will lay practically the entire twelve months of the year. Their eggs are a third larger than hen eggs and are pure, clear white in color and have a rich delicate flavor, and in the cities they bring a fancy price on the market. They are very much sought after by the fashionable class of people who are willing to pay good prices for them. Their clear, white shells give them a very fine appearance when served boiled.

These ducks were first produced and raised in India and were brought to the United States about twenty-five years ago, and have won for themselves a high position on the eastern markets, but only in the last eight or ten years have they been raised by the people in the middle states, and then mostly by those families who desired them for show purposes. But in the last four or five years a few people are waking up to the fact that there is money as well as pleasure in raising them. A flock of these birds is certainly a beautiful sight. In color they are fawn and white and they are very upright in appearance and swift in motion. There is no suggestion of the awkward waddle of the common duck. Their bodies are slim and racy looking, and the neck is a pure white while head, breast, back and body a light fawn, and primary and seconary flights of wing should be pure white. Legs and toes are orange color.

Their peculiar markings and upright racy appearance make them very attractive and to see them is to admire them. All this will appeal to the fancier, but best of all for the average man is their ability to easily surpass anything that has yet been produced to supply eggs for the table and market.

The standard weights for a mature bird are drake 4½ pounds and duck 4 pounds, but by careful selection of breeders they can easily be made to weigh 6 to 7 pounds.

They mature very rapidly, reaching market size in nine weeks. There is no bird that grows faster the first two months of its life than the Indian Runner Duck. While they can be raised quite successfully in confinement they thrive best on free range. A two-foot fence is sufficient to confine them. This fact alone together with their wonderful egg producing qualities make them worth while for the city man to raise.

Indian Runners require no water except for drinking purposes. The belief in the past that ducks could not be raised without a pond or stream of water has been a detriment to the extensive culture of these birds which has been overcome by the Runner's ability to thrive on only a panful to drink.

They are small feeders compared with other ducks and in summer if allowed to range they will find the greater part of their food in the fields. But they should be given a small feed especially at night to induce them to come home.

They should be kept in confinement until nine or ten o'clock in the morning or their eggs will be lost on the range.

If forced for egg production they commence to lay when about five months old and no other fowls are able to stay in the race with them. They are truly the Leghorns of the duck family.

Indian Runner ducks are the finest of table fowl, their meat is fine grained, tender and juicy and of excellent flavor. They have rather the flavor of a wild duck than of a tame bird. They produce an enormous number of eggs and they are very easy to raise, therefore one need only have a very few to start with and at the end of the season he will have a nice flock, which if properly handled will prove a source of income through the winter months.

If they are not where they can get it themselves they should be always supplied with grit in the form of sand or small gravel and oyster shells.

A good feed for them during the hatching season is a mash composed of cornmeal 35 parts, wheat bran 15 parts, middlings 15 parts, beef scrap 12 parts, and if they are kept confined add a liberal amount of alfalfa meal.

Their food for the first week or ten days should be bread soaked in skim milk or water and squeezed dry; feed on a clean board sprinkled with sand. Gradually change to one-fourth part corn meal, one-fourth middlings and one-half wheat bran, keeping sand where they can get it when wanted.

In my opinion the Indian Runner Duck is one of the most profitable fowls there is to handle.

HOLSTEIN BULL CALVES FOR SALE

Having sold out our bull calves sired by our Chief Josephine bull we have now coming on a lot of toppy fellows out of our Josephine heifers and by Campus Josephine Lad who is a son of Pontiac Gerber De Kol with a record of about 18,000 pounds of milk in her four year old form and Grand Champion at Missouri State Fair. This is an exceptionally fine lot of calves and anybody will do well to get one of them for a herd bull. The price is $25. They won't last long at this figure.

D. D. Moss & Son, Columbia, Mo.

Poultry Show Farmers' Week

One attraction for Farmers' Week the poultry people should not overlook is the poultry show put on by the Boone County Poultry Association. A very liberal premium list is offered and if the show is up to its last year's record it will be time well spent to see it.

The University will conduct a poultry course of instruction during Farmers' Week that will be worth all the cost of a trip to Columbia will cost. Lectures will be given every day during the meeting by some of the ablest poultry authorities in the country. Demonstrations will be given daily in candling eggs, judging poultry for utility and vigor and killing and dressing. Remember the date, January 11 to 15.

Beekeepers Meet

At the annual meeting of the Missouri Beekeepers' Association, held in St. Joseph Missouri, December 7 and 8, 1914, it was decided to incorporate and a meeting is called to be held in Columbia during Farmers' Week.

The bee industry is of much greater importance to the state than most people are aware of but it could be enlarged several times without overstocking the honey market. A lot of honey is shipped into this state to supply our markets that ought to be produced right here at home.

In 1910 there were 40,110 farms keeping bees with 203,569 conolies reported and an estimated value of $584,549. There was a total of 2,105,815 pounds of honey produced that year.

The officers of the Missouri Beekeepers' Association are:

J. W. Rouse, President, Mexico.

W. F. Cox, Vice-president, Garden City.

J. F. Diemer, Treasurer, Liberty.

Austin D. Wolfe, Secretary, Parkville.

German Servant Girls Wanted

Several high-class families in Columbia want good, dependable German servant girls. In order that they may keep each other company it is desired to get two or three girls from the same neighborhood. 148 Chicks From 150 Eggs

Osceola, Mo.

I surely praise the Sure Hatch incubators. I have a 150 egg size. The first setting I put in 152 eggs and broke two the first week which left only 150 at hatching time. I got 148 chicks and never tested the eggs. We surely have had fine luck with our machine the past two years. Would not sell it and be without it for any money. My neighbors have other incubators and I beat them all. NELLIE GARDNER

Frank Hammond
President

Women and children find it easy to succeed with the Sure Hatch Incubator

We can give you the names of tens of thousands who make a handsome, steady income with very little effort, and would not bother with hens or with any other incubator. The

Sure Hatch

Is Automatic in Operation

Our **Uncle Sam Poultry Book** will help you to succeed. It tells all about how to handle the business the best way. It is a compilation of official reports by U. S. Government experts. Tells what to do and what not to do. Many illustrations. Free with every **Sure Hatch.**

Any one can succeed with it, even if they have never seen an incubator before. It is a plain, simple, strong machine, so built that it can't go wrong. Will hatch in cold weather when others fail. We send with each machine complete instructions for operating that are very easily followed.

We guarantee it 10 years and send it to you freight paid, on 60 days trial. Satisfy yourself by actual test that it is a quality machine in every respect. Your money back promptly if it is not all we claim for it.

Poultry turns kitchen waste and other farm waste into ready money; and you can depend upon the Sure Hatch to bring you the chicks at the time of year you want to hatch them to get the best price for them.

Write for our Free Illustrated Catalog, giving full information on Sure Hatch Incubators and Brooders, with much valuable information about poultry.

Mr. Royce will furnish detailed information concerning any of the sales, will handle bids for our readers who are unable to attend in person or will make selections. This service is given without charge to our readers.

Live Stock Men Meet

The Fifth Annual Meeting of the Missouri Cattle, Swine and Sheep Feeders' Association will be held January 13, 14 and 15, 1915, during Farmers' Week at Columbia, Mo. A good program is promised in which leading stockmen, marketmen and Animal Husbandry investigators will take part. A special invitation is extended to all Missouri stockmen to attend.

H. O. Allison, Secretary.

New London, Mo.

Mr. R. P. Royce, Columbia, Mo.

Dear Sir: I received you letter of yesterday, relative to the boar which you purchased for me.

I received the boar in splendid condition, and I am certainly thankful to you for your efforts in buying said boar. I think he is quite a good hog and looks like he will, with proper care, develop into a very large one.

I made this remark to Mrs. Megown that I thought it was as good a selection as I could have made, had I been there and personally looked them over.

I have about sold all of my spotted boars—having sold all of the gilts that I could spare some time since. I still have some very fine Big Type (black) boars and gilts for sale that I am selling worth the money.

Yours truly,
B. B. Megown.

Sheley & Clatterbuck's Duroc Sale

It is with distinct pleasure that we call to the attention of our readers the advertisement of Sheley & Clatterbuck, New Bloomfield, Mo., in which they announce their bred sow sale to be held at the above place, Wednesday, January 20.

Ever since this firm entered the business, a number of years ago, they have been recognized as having one of the very best herds in the whole country, and their sales have always proven to be events of the greatest interest to breeders and farmers in this and other states.

The foundation for this herd was secured from the most prominent herds in the Corn Belt, and the matter of price was given very little consideration when they found what was wanted. This does not mean that they were extravagant in their purchases—they simply believed that blood would tell and they were willing to pay the price. The wisdom of this policy is shown in the class of young stuff produced in this herd and by their winnings in the show ring.

We know of no other firm that has as many good boars in service as will be found in this herd. At the head of the herd stands the great boar Beauty's Model Top—conceded by all to be one of the best boars of the breed. Beauty's Model Top is the only Duroc boar that was made champion at the Missouri State Fair two years in succession, namely, in 1911 and 1912. Besides being a great individual he has proven to be a prepotent sire and his get have been conspicuous winners at various state fairs. Assisting him is another grand champion, Instructor. It will be recalled that Instructor was grand champion at the Illinois State Fair a few years ago. This boar was purchased to use on Beauty's Model Top sows. S. & C.'s Valley Chief, whose picture is shown below, was the first prize aged boar at the recent Missouri State Fair, and is proving to be a valuable sire. S. & C's Valley Chief was the sire of Sensation Chief, the second prize under year boar at the same fair.

The fourth boar in service is Col. Prim—a boar without a show record, but with a breeding record that is first class.

The offering this year consists of fifty head—practically all sows that have produced one or more litters.

In the lot will be daughters of Beauty's Model Top, Col. Prim, Col. S., John's Ohio Chief, Kelly's Pilot Wonder and other great boars. There will also be offered several sows that this firm had out last year in their show herd, including the great sow, Edna's Beauty, the first prize aged sow at the 1914 Missouri State Fair. Edna's Beauty is by Beauty's Model Top and out of the great producing sow, Edna Browning.

This sale will be one of the best events of the season and we cannot urge our readers too strongly to take advantage of the opportunity to secure high-class breeding stock. This firm does not expect sensationally high prices, and extend an invitation to all Missouri farmers to be their guests that day. Write for catalog, mentioning this paper, look over the offering and plan to be there. We will have more to say in our next issue.

Our representative, R. P. Royce will attend this sale and will be glad to assist any of our readers in any way possible.

Kinloch Duroc Sale

When Dr. C. E. Still, proprietor of Kinloch Farm, Kirkville, Mo., announced his intention of entering the Duroc business, it was an event of considerable importance to Missouri. For years Dr. Still had been identified with pure bred Jersey cattle, and his Kinloch herd became known far and wide as one of the foremost breeding establishments in the country. So when he decided to establish a herd of Durocs live stock men knew what to expect—and they were not disappointed.

Dr. Still is a firm believer in good blood—he made a success of his Jersey herd by using the best he could find, and he knew he could make a success of his Duroc herd by following the some principle. Accordingly he set about selecting a herd boar that would immediately place his herd in the front rank. After much study he finally selected Illustrator, the grand champion boar at Illinois State Fair in 1913. Illustrator is generally conceded to be one of the greatest boars that the breed has produced. He is a remarkable hog in every way—combining extreme size, quality and bone to a very rare degree; indeed, he is hard to fault. He is backed with a pedigree that combines the very best blood lines, and best of all he has successfully passed the test that entitles him to the claim of greatness—by siring prize winners. Illustrator has the distinction of siring more prize winners at the recent State Fairs of Iowa, Illinois and Missouri than any other boar. Illustrator Chief, champion boar at Missouri, is a son of Illustrator.

Dr. Still did not stop with securing a boar—but gathered together one of the most notable collections of brood sows that was ever on one farm. These sows represented every important line of blood known to the breed, among them were champions, daughters of champions, and dams of champions.

In this sale, which will be held Friday, February 5, there will be offered about forty-five head of sows, all bred to Illustrator. There will be daughters of Col. Gano, Chiefs Col., Superba, Defender, Advance Chief, Cherry Chief, Proud Col., Orion's Model, Volunteer, L. E.'s Col., John's Ohio Chief, Top Col., Disturber, Golden Model 30th, Proud Professor, and other noted boars—truly a remarkable offering.

This will be Dr. Still's first Duroc sale, and he wants to place his catalog in the hands of every reader of this paper, and to every one who writes for a catalog mentioning this paper he will send a colored picture of Illustrator.

We feel that it is needless for us to go into more detail—there is so much that could be said—but we would urge every reader to write Dr. Still for his catalog and to arrange to attend this sale. Remember the date, and watch this paper for further particulars.

Mooresville, Mo.

Mr. R. P. Royce, Columbia, Mo.

Dear Sir: Yours of the 19th received. I want to say right here in the beginning that I appreciate your personal effort as well as that of The Missouri Farmer to make my sale a success. There is no doubt in my mind that anyone who really has something worth advertising can get splendid returns from The Missouri Farmer. It is not the amount of reading matter nor the frequency of publication that makes a paper valuable, either to the reader or the advertiser, but quality is the whole thing. It is better to have no knowledge at all than to have wrong knowledge. I will say this for your paper: It has more reading matter that is of real value to the farmer and breeders and LESS READING MATTER THAT IS DETRIMENTAL than any publication that comes to me.

Since it is located at the seat of our agricultural college and experiment station, and since many of those connected with this institution are frequent contributors to it and since Geo. B. Ellis is the editor it ought to reach and no doubt does reach the most progressive class of farmers in the state. This is the class that the advertiser of good, pure-bred live stock must reach in order to get returns.

With best wishes for your future success and that of The Missouri Farmer, I am

Sincerely yours,
W. T. HUDGINS.

Bruns' Jersey Bulls

Elsewhere in this issue will be found the advertisement of Wm. H. Bruns & Son, Concordia, Mo., calling attention to a number of high class young bulls and heifers that they are pricing worth the money.

This is one of the older herds in the State and is maintained on a high production basis. Careful records are kept of the production of the cows and only those which prove profitable are retained. It is therefore possible for buyers to know what they are getting.

This young stuff is sired by The Owl's Champion whose grand dam was Rubano's Fancy, with a record of 21 lbs., 10 oz. in 7 days.

We are glad to recommend this herd to our readers and trust that those interested will write Messrs. Bruns for prices. Kindly mention this paper.

The Lockridge and Pemberton Poland China Sale

On Wednesday, Feb. 3, Will G. Lockridge and J. M. Pemberton, both of Fayette, will hold their first public sale of Poland China bred sows and gilts.

Both these men are too well known to need any introduction from us. Suffice it to say, that their herds have been recognized for a number of years past as ranking with the better herds of this state.

The sale will consist of about fifty head and be largely from the Lockridge herd, Mr. Pemberton putting in about fifteen

MISSOURI VALLEY HERD O. I. C. SWINE
We have a fine bunch of fall pigs from mature stock on the "bargain counter" for quick delivery. Everything guaranteed as represented. Call on or write
J. M. Dryden, Phelps City, Mo.

head of extra good gilts—the tops from his herd.

The offering will be very strong in A. Wonder 143421 and Hercules 68356 blood. There will be listed twelve spring gilts by A. Wonder. They are the real good kind —with plenty of size, bone, and quality, and will be bred to The Giant, the mammoth young Hercules boar Mr. Lockridge is putting at the head of his herd. This is one of the most promising young boars the writer has seen the past year, and we doubt if many breeders can show a boar with more size.

There will be six spring gilts by the well known Iowa boar, Hercules, that are litter mates to The Giant. The gilts are all safe to the service of A. Masterpiece 71730, a son of the great A. Wonder 143421.

Ten spring gilts from the Pemberton herd are by Big Johnston, and are bred to Jumbo Wonder, also a son of A. Wonder. Eight fall yearlings by a Long King boar and bred to The Giant are going to look mighty nice by sale time. Besides the above mentioned there will be six big useful tried sows and about fifteen spring gilts by Missouri Orange, Col. Orange and Long King's Model, bred to one or the other of the above mentioned boars.

This stuff has all been handled well, has had the run of a large bluegrass pasture and will be presented in good thrifty condition—just right to go on the farms of this state and make good.

We have seen this stuff and take pleasure in calling the attention of our readers to it.

The sale will be held in a well lighted and heated sale barn. Fayette is on the Hannibal division of the M. K. & T. R. R. —twenty-five miles south of Moberly, twelve miles south of Higbee, and twelve miles north of Boonville.

Please mention this paper when sending for the catalog, and watch our next issue for more detailed information.

L. L. Spencer's Duroc Sale

L. L. Spencer, the popular Duroc breeder of Centralia, Mo., claims January 21 as his date for a bred sow and gilt sale. Mr. Spencer will offer a nice bunch of growthy gilts, and in as much as his sale follows Sheley & Clatterbuck's on the 20th, buyers should keep the Spencer offering in mind. Attend both sales at the cost of one. Watch this paper for more details.

J. M. Dryden calls attention to his O. I. C. fall pigs which he is making "bargain counter" prices on. Mr. Dryden's Missouri Valley herd is one of the good ones and he has built up a reputation for his herd through his fair and liberal dealing. Everything he offers is guaranteed to be as represented or your money will be refunded. Now is a good time to buy fall pigs—they cost less and the express rates are not high.

Have you written Smith Bros., Thompson, Mo., regarding the bred sows they are offering? In a recent letter they have the following to say: "We are about sold out on boars and we are now ready to make a drive on sows bred to Beauty's Model. We have one aged sow, three yearlings, seven fall yearlings, some of which have raised a litter, and a number of spring gilts, all sired by Col. Bob and bred to Beauty's Model. We are breeding several sows to Col. Bob, and about ten to a son of Beauty's Model out of a Top Col. sow, second dam by Cherry King, third dam by Orion Chief, and fourth dam by Chief Surprise, a litter mate to Ohio Chief. He is one we have selected for our show herd for 1915."

This firm has an excellent herd and we commend them to our readers.

Crosby's Clydesdales

Elsewhere will be noticed the advertisement of F. L. Crosby, Mexico, Mo., proprietor of the Highview breeding farm. Mr. Crosby calls attention to the outlook for the draft horse business for the next few years, and announces that he is in a position to furnish young stallions and mares that have been prize winners.

What Mr. Crosby says is true, and the opportunity to get into the draft horse game was never brighter. Importations have been entirely shut off since the war began, and practically all the available horses in the various countries have been pressed into service. When it is stated that the life of a horse in the armies is only about ten days, it can be readily appreciated what a demand will be made on this country.

In view of the above it would seem that Missouri farmers should give this matter serious consideration. And we take pleasure in recommending the "Crosby kind."

Hugh Whiteford, Guilford, Mo., who advertises Herefords in this paper, is planning a sale in the near future, and those of our readers who will be in the market should write him for his catalog. The Whiteford Herefords are right in every way.

V. E. Lawrence, who advertises Angus cattle elsewhere in this issue can supply any one looking for a good young bull of correct beef type, at a price that is very reasonable.

White's Durocs

A. White, Jr., Palmyra, Mo., reports the sale of a high class spring boar sired by Golden Model 34th, to H. E. Reed, Macon, Mo.

Mr. White has a number of other excellent spring boars left that are right in every way. He also is offering the trade a high class lot of spring gilts sired by Crimson Wonder Again, Crimson Col. I Am, Golden Model 34th, L. E.'s Valley Chief and Col. Dominant. We have seen this lot of gilts and assure our readers that they will be pleased with them. If in the market for something good, Mr. White would be glad to quote you prices.

Three Shorthorn Bulls

I offer three April bull calves, straight Scotch breeding, being by Lord Collynie and out of Orange Blossom dams. The broad-backed, thick-fleshed kind. Priced to sell.

J. F. Richards & Son, Bevier, Mo.

SHELEY & CLATTERBUCK

ANNOUNCE THEIR ANNUAL

Duroc Bred Sow Sale

TO BE HELD AT

New Bloomfield, Mo., Wednesday, Jan. 20.

Fifty Head of Tried Sows

Our offering this year will consist of about fifty head of very high class tried sows, representing the very best lines of breeding. A number of the sows listed are prize winners, others are the dams of prize winners—all are good. Included in the offering is the great sow EDNA'S BEAUTY, first prize aged sow at the recent Missouri State Fair; DECEMBER GIRL, by Beauty's Model Top, is another prize winner included. There will be a number of BEAUTY'S MODEL TOP sows, some by COL. PRIM, and others by COL. S., JOHN'S OHIO CHIEF, KELLY'S PILOT WONDER, Etc. Practically the entire offering will be bred to one or the other of our two CHAMPION boars, BEAUTY'S MODEL TOP, and INSTRUCTOR.

The catalog will be sent to all who apply, mentioning The Missouri Farmer.

CHAMPION ILLUSTRATOR BRED SOW SALE

Kirksville, Mo., Friday, Feb. 5th.

Illustrator is the World's Champion Sire. No one boar produced so many winners at the big State Fairs of Iowa, Illinois, and Missouri in 1914, as did Illustrator. The blood of Illustrator will help your herd.

I take pleasure in announcing that on Friday, February 5, I will offer at public sale between forty and fifty DUROC SOWS bred to the champion Illustrator. These sows represent the very best of breeding and individuality. In the sale will be included daughters of COL. GANO, CHIEF'S COL., SUPERBA, DEFENDER, ADVANCE CHIEF, TIPPY COLONEL, MISSOURI MODEL TOP, CHERRY CHIEF, PROUD COL., DISTURBER, TOP COL., L. E.'s COL., JOHN'S OHIO CHIEF, FORREST CHIEF, GOLDEN MODEL 30th, PROUD PROFESSOR, and other noted boars of the breed.

BLOOD WILL TELL, and this sale will afford a rare opportunity for breeders and farmers to secure blood that will strengthen their herds.

I extend a cordial invitation to all my Missouri friends to attend this sale and I want every Duroc breeder and farmer to have a copy of my catalog which will only be mailed on request. In writing mention The Missouri Farmer.

BAKER'S REAL BIG-TYPE POLANDS

Our winnings at the State Fair prove that we "have the goods." Spring boars and gilts of excellent breeding and individuality at very reasonable prices. Also a number of fall boars, big, stretchy fellows.

W. A. BAKER & SONS — — — — — BUTLER, MO.

CLYDESDALE HORSES FOR SALE

MISSOURI FARMERS, DO YOU RECOGNIZE THE OPPORTUNITY?

The war in Europe means that the United States will furnish the Draft Horses and Draft Breeding Stock for the world for years to come. There was never a better time for you to get into the game and Missouri farmers should take advantage of the opportunity. I have Prize Winning Stallions and Mares of all ages for sale at lowest prices.

F. L. CROSBY, Highview Farm - - - - - - - Mexico, Mo

"Last spring my sows were very wormy and out of 110 pigs, we saved only 53, and even these were in bad condition and would not put on weight until I fed them Sal Vet. After that they started to gain.

"This fall I fed Sal Vet to the sows and the pigs came stout and hearty. Out of 153 we saved 123 and they are all doing finely. I would not think of being without Sal Vet. H. F. Hodgins, R. F. D. 4, Lawrence, Kans.

"I have been feeding Sal Vet to my hogs, and want to say that it is O. K. Last week I sold forty-six nice, fat hogs, but my neighbor across the road has lost all kinds of hogs; he buried thirty-five in one day. I have not lost a single one yet. Have thirty-five still on hand, and they are all nice and healthy."

S. A. Wilkerson, Stanberry, Mo.

"I am glad I found Sal Vet. Our pigs to which we have been feeding it, weigh 100 pounds apiece at four months old, and an old mare to which we are feeding it, is looking much better, and is much better, after discharging an enormous quantity of pin worms."

James W. Raw, Rt 2, Marceline, Mo.

"Enclosed is check for my Sal Vet. My hogs are now healthy, and are doing fine. There has been some hog sickness around here, but my hogs have escaped so far."

Alvin Day, Cornland, Ills.

"Your Sal Vet is vertainly all to the good, and you may always count on me to be a booster. When the Sal Vet arrived, our hogs were either all sold, or dead with the cholera. There were five little runts alive, which were considered as good as dead, but, thanks to Sal Vet, they are the best looking hogs of their age in the neighborhood. My one regret is that we did not get Sal Vet sooner, as I feel that we could have saved the whole bunch." LeRoy A. Barrett, Oswego, Ills.

I'll Rid Your Stock of Worms

I'll Prove It Before You Pay

I Want You to Know The Value of SAL-VET

—I want you to feed it at my risk—I want to prove to you on your own farm that SAL-VET will rid your stock of worms, put them in healthy condition, easier to keep on no more feed—more profitable in every way—and less liable to disease. I don't want you to send me a penny in advance—just mail the coupon. I'll ship the SAL-VET just as agreed, let you feed it 60 days—and if it does not do what I claim, then I'll cancel the charge. Is not that a fair, open offer?

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Worm Destroyer — **The Great Live Stock Conditioner**

—is the medicated salt which contains no antimony, fed just as you would feed common salt. There is no dosing—no drenching—no trouble—all animals need it—take to it readily—and so doctor themselves. You will find animals that you do not suspect of having worms just full of them. Stock that have been run-down will take on new vigor, grow thrifty and profitable. Stock kept free from worms will be healthier; will do better, act better, and be in better condition to resist dangerous diseases. As proof of this read a few of the thousands of letters from stockmen who feed SAL-VET — who depend on SAL-VET to help them make greater profits — and to prevent loss.

READ!

"Before I started to feed SAL-VET my hogs were sick, and I had lost six of them, since feeding SAL-VET I have lost none, although some of them were pretty sick before they had access to SAL-VET and had lost their hair. However, they pulled through all right and now have good appetites and are thriving."

ERNEST TRIEBEL, Route No, 2, Clearwater, Minn.

"After feeding SAL-VET to sheep, hogs, horses and cattle during the past winter, and found it a reliable conditioner and worm destroyer. My stock never looked so healthy and thoroughly conditioned as now."

U. H. SUMMER, Brownville Jct., Maine.

"My hogs are doing finely; have kept SAL-VET before them for two months and while there has been lots of disease amongst hogs in this section, none of mine have been sick."

GEO. A. ELINE, Route No. 20, St. Matthews, Ky.

"I have fed SAL-VET to all my stock; it has put them in fine condition, and improved them wonderfully. The cholera has been killing hogs all around my home, but I have not lost a single one. I have never used so effective a remedy."

SANFORD GERST, South Boston, Va.

"I enclose check in payment of the SAL-VET sent recently. Four times this sum would not begin to pay for the benefit I derived from feeding SAL-VET."

W. H. WALLACE, Franktown, Va.

"I have great faith in SAL-VET. Since feeding it, I can certainly see a great improvement in my stock. I have fed a number of different stock foods and remedies, but have never found any as good as SAL-VET. I am recommending it to my neighbors and others who lost hogs with the cholera."

C. G. FIELD, Hiawatha, Kansas.

READ!

"I am feeding SAL-VET to 750 lambs and about 100 hogs. During this time there has been no sickness whatever among this stock. I consider SAL-VET cheap insurance."

THOS. J. LILLY, Wheeling, Mo.

"SAL-VET is certanly a great medicine. I have been feeding it all winter, so far and since I started, my stock are better than ever before."

ALBERT MEANS, Walthill, Nebr.

"Have been feeding SAL-VET to some of my horses which were very thin and in a run-down condition. They have now picked up in flesh and spirits in spite of the heavy work incident to this time of year."

ELI FURLAND, Artesian, S. D.

"I had a yearling colt which was not doing at all well. I had fed turpentine, tobacco and other worm remedies, but all failed. On the evening of the 19th of February, I gave this colt a dose of SAL-VET and the following day I had plenty of evidence of its value. It is doing the work, all right."

HARRY BRENNEMAN, Rt. No. 5—Ottawa, Ohio.

"I am well pleased with SAL-VET. I never knew a horse could have so many worms and live. SAL-VET surely brings them—big and small. Horses to which SAL-VET is fed, act 100 per cent better, and what we formerly thought was colic and meanness, was nothing but worms and worms."

J. E. TERKEURST, 271 Dauphin St., Mobile, Ala.

"The more I use SAL-VET the better I find it. My sheep and hogs were never so thrifty and healthy as now. We butchered this week, and did not find a single worm, while our neighbors' hogs are wormy and dying. I have been recommending SAL-VET to them and they are now ready to use it too."

WESLEY CHAMBERS, Bussey, Ia.

Future Land Values

We believe that we are standing on the eve of a revolution in American Agriculture. Beyond any question, one of two things must happen—either the average farm must be made to earn more money or the present value of farm lands will go down. This fact is as true as the eternal verities. Up to this time, the wealth of the average farmer has come from an increase in land values rather than from what he has made in his farming operations. Of course, there are exceptions but we state the rule. The farmer who inherited his farm or who bought it when land was cheap years ago deserves no particular credit for being worth $20,000 or $30,000 today—for his good fortune is due chiefly to the evolution of land values which, in many states, was as much as 100% during the last census decade.

Now, however, we face a new situation. Unless we are very much mistaken, land values will not advance in any marked degree during the next decade. Certainly not as much as during the last. In other words, in our opinion, it is up to the farmer to demonstrate that his land is worth the amount of money invested in it—and unless he can do this, sooner or later, the leveling process of values will be inevitable. But here is a second proposition which is also vital and which must be reckoned with: If Jones, by the employment of modern methods, is able to make his farm pay while Smith, by slip-shod methods, keeps on running behind—then it is merely a matter of time until the Smiths are going to have to give way to the Jones type of farmer. Mind you, we are not saying that this situation threatens to undermine the business of farming. Agriculture is the Nation's great basic industry. The farmer feeds and clothes humanity and Agricultural husbandry will ever remain the World's most fundamental avocation to which society will in the future, as in the past, we compelled to pay a more or less adequate tribute. But we have, nevertheless, reached a point where we will have to prove that farm land is worth its present price—and in establishing this fact it is bound to be largely a battle of the "survival of the fittest."

Nor is there anything in this situation to become alarmed about. On the contrary, it will prove the salvation of American Agriculture—the dawn of a "New Day" in which the farm will come into a wider and broader sphere than it has ever known before. When we prove that we can make land return a good income on an investment of $150 or $200 per acre we are sending a message of hope to thousands of stalwart young farmer boys whose only chance to ever own a farm of their own is to buy and pay for it at present prices—and no message will ever have been fraught with gladder tidings for it will spare them from a life of thankless toil amid the roar and hectic glare of the great cities which are already overcrowded.

So, too, it will mean that fine farm homes with modern conveniences and big red barns will flourish as never before. It will mean that consolidated rural high schools in which the country boy and girl are given an equal opportunity with the boy and girl in town will become living realities all over Missouri and throughtout the Nation. It will mean that good public highways will no longer remain merely a pleasant dream and that a score of other things which will make life on the farm more enjoyable and profitable will at last be definitely written across the horizon of the future. In the aggregate, these things will cost many millions and so long as farmers are merely breaking even their realization will be impossible. In other days the farmers of Europe faced this crisis and won—and what the European farmer has done the American farmer can do, once he makes up his mind.

All over Missouri there are hundreds of farmers who are playing the farm game successfully—who are putting money in the bank and greater fertility into their soil while thousands of others are borrowing funds with which to buy feed. It is the mission of this paper to tell you how they do it—and a more important task does not exist within the commonwealth. Upon its solution depends the future value of your farm and the enjoyment which you and your loved ones will get out of farm life.

WILLIAM HIRTH
PUBLISHER

CATTLE SITUATION FROM VIEW-POINT OF THE FEEDER

S. P. Houston, Malta Bend, Missouri, before the Missouri Cattle, Swine and Sheep Feeders' Association, Farmers' Week.

It is a difficult matter to form a definite idea or make a forecast with reference to the cattle situation that will hold good, for the simple reason that the "viewpoint" of one upon a problem of so great a magnitude as this must necessarily be, is circumscribed by the scope of the individual horizon; hence from the narrow confines of my own perspective, I shall be unable to give you much that will be of substantial benefit, but if I were permitted to beg, or to borrow from those who have opportunity of wider vision, then I might hope to give a more intelligent conception of the situation.

The year 1914 has been a memorable one for the cattle feeder viewing it from any angle that we may—and the wonder is, that there are enough of us left to tell the tale, or constitute a quorum for future operations.

Optimists that we all are, we began the year with every promise and hope that the recurring months would bring us a generous reward, but we had not reckoned with the fates that shape the destiny of men, and likewise of nations; for ere the roses bloomed, the grass began to wither beneath the slanting rays of a torrid sun, and in the wake of this came a myriad of pests to share the scanty supply of summer forage—and, as a result, our feed bills mounted upwards—beyond all our calculations, and the profits which we confidently expected to gain vanished in the same ratio. Then when we were in a measure reconciled to the situation, we were aroused by the rumbling of giant seige guns, which announced to us that war with all its horrors was again abroad in the world; and no sooner had we settled down to the task of supplying bread for the hungry millions, than some avaricious importer, under the beneficent privileges of an indulgent government brought to our shores the germs of the dreaded and disastrous "Foot and Mouth Disease," which has proven so highly infectious, and has spread so rapidly that the immediate damages are reckoned up in the millions, while the resulting injury to future business is beyond computation.

So runs the story of our business during the year that is past. But notwithstanding all of these adverse conditions, cattle sold on the open market for the highest average price ever known to this generation. Yet, this is but cold comfort and scanty consolation for the average feeder, the condition of whose bank account indicates that he did not share in the record prices, but rather did he contribute to the record without a fair remuneration.

Let us turn from the year that has brought such great disappointment and disaster to the fraternity to the one that is before us—young with hope and with its possibilities yet unmeasured. Its conditions are more complex and the finish more uncertain. But, the "still small voice" impels us to "stay in the game, for there is yet another and a better chance to win."

The trend of the cattle industry during the past decade indicates, unmistakably, a growing scarcity of beef animals, and added to this is the significant fact that seven-tenths of the world is now engaged in the most destructive war that ever blotted the pages of history, consuming not only the beef but the breeding herds that must be the foundation of future replenishment. It is estimated that it will take Europe thirty years under normal conditions to again establish the cattle situation which obtained there six years ago, and during all these years there must be a greater demand upon the depleted supplies of other countries, where no sufficient surplus exists, to meet the condition of an unnatural emergency.

It is lamentable, but nevertheless true, that the average man does not give much credence to the figures and estimates made by the agricultural department of our government with reference to the live stock industry, as too often the figures are a year old before they are available as a matter of general information. So, I give them to you for what they are worth and in dealing with the future of the beef making industry I trust that no one may be influenced to his injury by anything I may have to say.

The latest figures from the Department of Agriculture indicate that the shortage of meat animals since the census of 1910 is 9 cattle, 7 sheep and 3 hogs for each 100 of the estimated population in January, 1914. This means that it will take 18¼ million head of meat animals more than we have today, in order to give the present population the same meat supply that we had four years ago. Hence, it would seem that the only factor with which the producer has to reckon with in the near by future is the ability of the consumer to pay the price, and had it not been for a widespread industrial depression and a consequent stringency in money matters, we would not be forced to accept so violent a recession in the prices of products today.

So, in the last analysis, the future market conditions will be largely responsive to the activity of the channels of trade and industry. That the steadily vanishing meat supply is a matter of vital concern to both the producer and consumer cannot be denied, but the hypocritical craze to reduce the high cost of living by reducing the price of the products of the farmer and the feeder is not an unmixed evil, for no greater calamity could befall the world today than to force the agricultural and live stock interests into a period of low prices. War is now raging among the great nations of Europe. Crops have been destroyed or remain unharvested. Millions of people in Europe must be fed, and food production in Continental Europe and parts of Great Britain is almost at a standstill while consumption of meats and other food stuffs is vastly greater than production. Our nation is pressed to feed its own people and our export surplus is small even at prevailing high prices and the demand promises to be far greater even if the war is of short or long duration. The matter of price is likely to prove a secondary consideration. The people must be fed. Where is the meat coming from? Food authorities say that the supply of food animals in Europe cannot last six months longer.

So far as the quality and economic production of beef is concerned, the feeder is not loafing on the job, but rather is he using his best efforts with the means at his command to increase supplies and thus lower the cost of living. Contrary to the common rule of trade, high prices have not stimulated greater production, but rather have they induced the selling of the increase from our herds at a premature age, and it does not take much study of this matter to realize what the effects will be if the country ships stock to market prematurely in poor condition and lacking weight and finish. It would be a big mistake if farmers were to market hogs without fattening them, as their killing value would be lacking and their market value during the winter packing season would be affected accordingly. The fostering care and kindly encouragement which our national government has given the live stock industry in recent years has been conducive to raising prices rather than calves; that the agricultural experiments both by the states and national government along the line of soil cultivation and conservation have been made at the expense of the cattle industry, is a very potent and pertinent fact; and in so doing they have left the cattle producer to shift for himself, either to survive or perish, or in any event, he must keep out of the track of progressive civilization and pitch his tent beyond the Great Divide. So a plan to augment the number of beef animals upon the farms that would be profitable and productive has not yet been suggested, and the average farmer figures that he cannot afford to take the chance of producing cattle on high priced land—hence, he prefers to sell the crops

(Continued on page 18)

Hayes Four Wheels—Bigger Yields

GOOD seed and good soil is only the *starting point* in raising a big corn crop. You can no more afford to plant with an old, worn out corn planter or a complicated new one full of fads and fandangles than you can to plant *poor seed.*

You can't afford to waste your time and labor or *risk your entire crop* with a planter that covers unevenly, misses hills or does not check accurately.

Uneven depth of planting means a bigger loss than many realize. It's *especially bad* in cold, backward seasons; often amounts to several times the cost of a planter in a single year. Avoid planting part of the corn so deep that no matter how good the seed or how rich the soil *many of the hills never come up*—or leaving other hills uncovered so that the sun and wind *destroy or stunt their growth.*

Hayes Four-Wheels regulate depth of planting to the *fraction of an inch.* Corn all comes up at the same time, allows earlier cultivation, an earlier harvest, a *better quality* and *bigger quantity.*

28 Years the Leader

Hayes Four-Wheels guarantee *surer germination and quicker growth.* Wheels pack the dirt from the sides to hold moisture and leave a ridge on top so that the corn sprouts quickly and comes up several days sooner. The ridge gives greater surface for the sun's heat and prevents washouts in hilly fields. This method *assists the budding sprout,* protects its vitality and makes stronger and healthier stalks.

Hayes Four-Wheels *cover where all ordinary open wheels fail*—even in wet and sticky ground. Guaranteed not to clog. Short coupled, light draft and turns in shortest space. *Checks with absolute accuracy,* regardless of team's speed. Cross rows straighter than the way you drive.

The **Hayes** Drop *never misses a hill.* Simple, reliable and most efficient. Fewer parts, less breakage and delays. Has no clutch to miss and give trouble. *Never cracks or grinds the seed.* Will drop accurately any size or shape kernel. *No bare spots* in **Hayes** planted fields. No replanting necessary. Increased yields soon pay for it.

Thousands in use for years with practically no repair expense and every one giving *time-saving, money-making* service. No complicated parts to get out of fix. Strong construction, *practically exempt from breakage.* No expensive and aggravating delays in the busy planting season. Easy and simple to operate and can be trusted to unskilled help.

Think these things over and start investigating NOW. Learn the overwhelming advantages in **Hayes** Four-Wheel construction. *Ask any* **Hayes** *user.*

Learn the experience of farmers who *have* increased their yields by big margins with the use of the **Hayes**—who *have* finished planting earlier—who *have* begun cultivation earlier. Every **Hayes** user will tell you the work is easier—faster—better; the results more satisfactory—more profitable. So much depends on the work of the planter that a farmer cannot afford to get anything less than the *best service.*

Can be furnished with perfect working Fertilizer or Cow Pea Attachments, Stub Runners or Disks.

WRITE! This planter is *guaranteed.* It *must* be all we claim and all you expect. Send for Free Book "AP" of Valuable Planting Facts. Write today, then you won't forget.

The Missouri Farmer

VOLUME VII FEBRUARY 1, 1915 NUMBER 3

Why The Farmer Does Not Make More Money

Dr. E. H. Bullock, Edina, Missouri

That the average farmer has not been making a fair rate of interest on his investment has long been an established fact. The farmer knew this was the condition, but how to remedy the condition he did not know. The banker knew the farmer was not making a fair rate of interest on his investment, but how to help the farmer and with safety to the bank he did not know. Often the banker was compelled to refuse his farmer customer money, when the farmer's very existence seemed to depend upon the loan of the money for which he was asking.

The conditions which exist in the loan business of our country are far from just to the farmer. He is compelled to pay the highest rate of interest and at the same time furnishes the best possible security. Why is this condition? Simply because the farmer can and does stand for it. Not because it is just. What line of business could exist, but the farm business of this country, add ten billions of wealth to this nation, do it on a borrowed capital of six billion dollars, on which was paid an annual sum of five hundred and ten million dollars interest? This is the condition that exists in the United States today. The farm wealth of this country is forty billions of dollars, we add ten billion dollars to the wealth of this country every year, on a borrowed capital of six billion dollars, for which we pay a rate of eight and one-half per cent interest. The lender getting for his security almost seven times the value of the loan. Do these figures stagger you fellow farmers? Well they are true. True as it is possible to make State and Government reports. No wonder we are astounded when we stop to think of it, when we stop long enough to take an inventory of ourselves. We wonder, can we do it? The answer from twelve million farmers all speaking in unison, is, We have done it and we can do it again..

Farmers Make 3 and 4 Per Cent

Stupendous as all these figures are, and vast as the farm values are, and although the farmer adds twenty-five per cent of all there is invested in farm interests to the wealth of our nation annually, we are only making between three and four per cent annually on our investment. Where does the other twenty-one per cent go? Do you ask? The echo answers. Will some of the business men as they call themselves, from the banker to the barber, please tell us? Why don't the other fellows call us business men? It must be because we let the other fellow get over eighty per cent of the wealth after we have raised it.

The average farmer is compelled to sell the fruits of his labor at wholesale, and at the same time buy the necessities of life at retail, a condition under which no other line of business could exist. We pay eight and one-half per cent interest, while other lines of business pay four and one-half per cent for their money.

At this present writing, some of the warring nations of Europe are, or have been, seeking war loans in New York, with a fair show of obtaining the same at a rate of about one-half the rate of interest that would be charged the honest farmer—the farmer who is now raising the bread, and in many instances sending it without money and without price to the starving mothers and children, whose husbands or fathers have been murdered by the horde like armies of land-mad despots. These rulers of Europe offering as security, what may be in the future, the bonds

Dr. E. H. Bullock

of a fallen nation or the blasted hope of a military despot, while we, fellow farmers, offer for security **our homes, our farm homes** if you please, the basis of all true values. We offer in addition to our homes our stalwart citizenship, and the determination to succeed that knows not the word fail.

Hardships of the Pioneer

Forty years of memory, as we turn backward the pages of time, brings very forcibly to the writer's mind the hardships endured by the farmer in the pioneer days. Had not the virgin soil been rich with the accumulation of humus for centuries, the pioneer farmer must certainly have perished from hunger, so crude were his methods of farming. He had but to tickle the face of nature, as it were, and abundant harvests would burst forth. But prices were low and transportation means were slow and expensive, and at the end of each year most farmers sold their crops to pay the taxes, interest and store bills. And the family went without. Went without what, do you ask? Went without all of the luxuries of life and in many instances went without the bare necessities of life. Then how did they live? In many instances they did not live. If the western prairies could speak a thousand times, a thousand voices of the dead would cry out from as many unmarked graves, telling of the pangs of hunger that racked their bodies before death ended their suffering. These were the pioneer days in the states West of the Missouri River. The states East of the Missouri River never knew the hardships of the far West.

All this has past and gone. Where want once held sway there now exists farm homes that almost rival the Temple of Solomon in all his glory. Many farmers have become wealthy. Many have made only a bare living. Those who have become wealthy are usually those who had some money with which to start. With strict economy and good management, they have succeeded.

Must Do More Thinking

The time has come when we must do more thinking. We must apply business principles to our farming if we would make more money. Too many of us farm hap-hazard. We do not have enough system. We do not seem to know "The Game." A parody on one of Will Carlton's poems might read with more truth than poetry:

Some men farm for great things,
Some men farm for small,
Some, it is not recorded,
Why some men farm at all.

Many farmers do not make money because they are farming their land to death. They have cropped their land in one kind of crop without changing, until the land has passed the stage where its productiveness continues to be profitable.

A farmer remarked to the writer in May, 1914: "You are planting three and four grains of corn to the hill." "Yes," replied the writer. "In my opinion that is about right." "My land won't stand it.," said the first speaker. Then, replied the writer, "It is time to change your land." "Oh, I reckon," replied the first speaker, "but I thought I could get more out of it in corn than anything else. I can't get a stand of clover or timothy on it any more."

This soil robbery farming, no system of rotation, and too much one-thing farming, is one great reason why we are not making more money. The farmer must learn that he can not continue to take crops out of the land and put nothing back, and reap a profit on his investment. He must also learn that he must do more diversified farming. He must have more different kinds of crops growing. Must not depend upon one or two kinds of cops. When the farmer depends upon one or two kinds of crops and they fail, he has no chance of success. If he depends on five or six kinds of crops it is seldom more than two of them fail the same year.

Raise Clover and Alfalfa

Fellow farmers, don't plant rolling land in corn more than three years without changing it. A change in two years is better. Raise more wheat, sow more clover. Be sure and sow some alfalfa. It will grow on most any land that will raise good corn. Alfalfa is the only crop you can grow, take all you raise off the land, continue the crop for twenty years, and have the land better than when you sowed it. If you don't believe it, try it! If you try it you will try more and will never be without it. The slogan of the Missouri farmer ought to be: "Alfalfa on every farm and hog cholera on none." The alfalfa on every farm will go a long way toward keeping the hogs on every farm in such a condition of health that they will seldom take cholera, especially if reasonable care be taken to prevent it.

Rotate and Diversify Crops

Experience has demonstrated beyond all doubt that crop rotation, diversified farming, the proper use of barnyard manures and fertilizers, proper tillage, good seed, good stock, and last but not least, good common sense, insures farm prosperity.

Think, fellow farmers, think.

"Think for thyself, one good idea,
But known to be thine own
It's better than a thousand gleaned
From fields by others sown."

The farm labor question is another reason why we are not making more money. People of all trades and callings go to the farm to get a living when their job in the city fails them. I say these people go to the country to get a living. They get it, but they seldom earn it. The writer has had men from the city employed who could not do a decent job of calling hogs. These fellows wanted about thirty dollars a month and board, a horse to drive on Sunday, and as little work as possible. Some farmers might make such help a paying investment. The writer never could.

The man who has worked in the city until he has passed the age of thirty or thirty-five is seldom a profitable laborer on the farm. Farm help to be profitable must know how to do reasonably good work. He must know how to care for all kinds of stock at all times, must know how to use and regulate farm machinery, must know how to prepare soil and plant all kinds of crops. One day's blunder although it may be unintentional on the part of the farm hand, may cost his employer ten times his wages for a month. There are too few men who are worth paying enough to make them profitable workers on the farm. I'd rather pay a man for what he knows than for what he does, but we must have knowledge and action both in farm help in order to have a success. If a farm laborer is intemperate, better let him go. If he is profane, better let him go, for a profane man nine times out of ten will abuse the teams. If he is not congenial and talks back, or argues a better way, let him go. When he thinks you can't get along without him, be sure to let him go.

On the other hand, let's remember that the farm help longs for homey surroundings. See that he has a good room, a comfortable bed and treat him as you would like to be treated. Let's not treat him as we were treated. I heard a farmer say to a hired man not long ago, "I never worked as a farm hand in my life." "I knew you hadn't," was the reply he received from his employe, who, by the way, was an excellent man, who knew his work well, and who was above all else a gentleman.

We are our brother's keeper, and the employer and the employe must have interests in common for both to receive that for which they are striving—success.

Fellow farmers, these are a few of the reasons why, to my mind, we are not making more money. To remedy these conditions is another thing.

I think the County Agricultural Bureau is doing more, with the County Farmer Adviser, to solve these problems of the farmer than all else. I believe the time is not far distant when we shall do much better farming and make more money than we have been making. I believe a new era is dawning for us. I believe in my fellow man.

SERUM ALONE AND SIMULTANEOUS VACCINATION FOR HOG CHOLERA

J. W. Connaway, Veterinarian, Missouri State Experiment Station

Judging from letters that have come to my office, many farmers in various parts of the state have got the impression that I have had a bill introduced in the legislature to prohibit the use of hog cholera virus in what is called the "simultaneous method" of vaccination. This impression has been spread by the concerted action of a number of serum manufacturers, through circular letters and newspaper articles. Some of these circular letters have been forwarded to me by the farmers. These circulars give a brief argument for the "simultaneous method" which they assert confers a "life immunity" (?). They also contain arguments against the "serum alone" method which gives a temporary immunity. These circulars all end with an appeal to the farmers to write their Representatives and Senators to vote against the bill. The following is a sample: "If in favor of the "serum-virus" or simultaneous vaccination, and not in favor of the pending bill, write your Representative and Senator strongly protesting against such enactment; or if acquainted, make a personal appeal to defeat such measure." (signed—— Serum Co.)

Notwithstanding the impression that has been made, I do not have any bill of any kind before the legislature nor am I sponsor for any bill. I have not written nor spoken to any member of the legislature or anyone else asking them to introduce or ask for any specific or general legislation on these matters. If such a bill has been introduced, it has been done on the initiative of the member himself, or suggested and backed by his agricultural constituency. And in this matter I am inclined to think that the "serum-virus" vendors have themselves stirred up the farmers in a way they were not looking for, and that a quite different kind of "protest" will be made by the farmers from that asked for. The following letter just received is a fair sample of others on file: Mr. ..... of Ash Grove, Green County, writes under date of January 18th as follows: Dr. J. W. Connaway, Columbia, Mo.—Dear Sir: "I see you are going to present a bill to do away with the virus. Now I think that will be a good thing to do. But I think it would be a good thing to hold the bill back awhile to let the farmers send in petitions to their Representatives. I could get a large petition here, as I am certain they would sign it almost to a man. I have used both serum and virus. And I would not have a drop of virus on my place again. I have tried both kinds of vaccinating and I like the single treatment best. I have had about 800 hogs vaccinated in the last year. One of my neighbors vaccinated 90 head, with the double treatment, with serum from two different firms, and has lost all but 35 head; and a veterinarian did the work for him. I do not think it is right for a man to be compelled to treat his hogs because his neighbor is careless, and have to vaccinate with virus and keep cholera on the place."

This farmer and his neighbors have evidently had the same kind of experience that farmers have had in many other parts of the State.

Farmers Are Thinking for Themselves

Here is a letter from Saline County. Dr. J. W. Connaway, Columbia, Mo.—Jan. 18, 1915. Dear Sir: "I don't want to trouble you with unnecessary complaint, but it seems to me that there should be necessary legislation concerning the use of the simultaneous method of hog cholera vaccination. Either prohibit it entirely, or require some means of quarantine whereby the cholera would not get scattered all over the country. This past summer cholera broke out near a neighbor, who thinks the simultaneous method is the only system, and practices it when there are no sick hogs in the country. After vaccinating he turns his hogs out and lets them run at large; some die and are left for dogs and crows to devour. (This man is well liked by the neighbors except for this one thing). Last season he vaccinated as usual. Cholera broke out among his neighbors' hogs and has been sweeping the country ever since. It is raging here now. I succeeded in saving enough hogs for meat and now have 12 brood sows and one shoat. Some of my neighbors were less fortunate. One in particular who lost every hog.

"Before we began to use virus we had an epidemic of cholera once in 8 or 10 years. Now it has assumed a more monstrous form, it is a continuos epidemic. We farmers trust there is some means by which we may be free of cholera. I would secure you a list of signers to this letter if I only had the time." (Sig.)

To Get Rid of Cholera

These two letters are sufficient to introduce the vital subject I want to write about, and it is not on prospective "legislation," but on the matter which is uppermost in the minds of all the swine growers and feeders of the State, and which is expressed clearly and briefly in the closing paragraph of the second letter quoted, namely: **"We farmers trust there is some means by which we may be free of cholera."**

The farmers, as a unit, sincerely desire to have their farms and herds **free from cholera** but they are badly confused in regard to the means by which they may attain that end most speedily and most economically. In this and succeeding articles I wish to show how they can rid their farms of cholera, and remain practically free from it. There is much rubbish in the form of false teaching and bad practice that we must eradicate before we can eradicate hog cholera. And I want to go into this matter thoroughly and without prejudice, and determine whether any particular measure or measures that have been proposed or put into practice meet the requirements demanded by the farmers: namely, that of **"getting rid of hog cholera."** We would be further on the road to success if the farmers and veterinary sanitary officers had kept before them this essential requirement instead of having been led off on side issues.

Let us take up first, vaccination; as that is one of the important questions now at issue. Vaccination has its proper place in any right scheme of hog cholera control. And I regard the "anti-hog-cholera serum" as one of the most valuable discoveries that has been made in recent times, so far as veterinary science is concerned. But the part it should play in the control and eradication of hog cholera has been so greatly exaggerated by some veterinary sanitary officers; and the exploitation of the "serum-virus" or "simultaneous method" (by commercial serum companies, and veterinarians financially interested) has been so great, that many farmers have been led away from right principles and practices of sanitation, in the belief that they had in "vaccination" all that was necessary to save their hogs, **and get rid of the disease.** But the facts are that wherever the greatest amount of vaccination has been done, and where the most "virus" has been used by the simultaneaus method, there is found the greatest amount of hog cholera infection. These are facts which the farmers of many counties will verify. It would seem that if the large use of serum and virus were an efficient means of **eradicating** cholera, there would not be so much of the disease in the neighborhoods where it has been used so freely. It was the experience of many neighborhoods, before the discovery and use of hog cholera serum and virus, that intervals of five or even ten years would occur between outbreaks of hog cholera. But now under the serum-virus regime, the disease remains upon many farms, or is an annual visitor, and each crop of pigs must be vaccinated.

Hog Cholera Increasing

If this were the most economical way of protecting our swine, and if under this system the growing of swine was stimulated and made profitable, I would not object to it. But what has been the result of the "vaccination wave" that has swept over Missouri in the past few years? Only a few years ago Missouri raised between five and six millions of hogs in one year, now the number is probably not more than four millions. Has this been due to a lessened demand for meats, and lower prices? That can hardly be the answer. The swine raisers and feeders says: "cholera." Many feeders ship in hogs from distant localities, from Arkansas, Oklahoma, Texas, Mississippi, when every one knows that it is possible to raise in the home county all the hogs that may be needed to eat all the corn that can be raised in the very richest county of the state. Besides feeding-hogs of a far better quality can be raised on the home grounds than can be purchased at a distance. But the losses from cholera due in no small measure to the commercial exploitation of serum-virus vaccination has brought about these conditions. The discovery and use of the exceedingly valuable anti-hog-cholera serum has thus apparently been more harmful than useful when looked at from the large point of view of protecting and building up the swine breeding interests of the State. We raise far fewer hogs than we once did, and I believe that the commercial use of hog cholera "virus" is largely responsible for it. The blame should not rest upon the "protective serum" and its proper use: namely, as an aid in a proper system of cholera prevention and eradication, and I am confident that the new state serum laboratories will be able to supply all the serum required for this legitimate purpose.

Serum Alone Method

Some of the readers of The Missouri Farmer may not have clear in their minds what is meant by the single or "serum alone" method; and the "simultaneous method" of vaccination, and the advantages and disadvantages claimed for each. We will consider these matters as fully as may be necessary. The same kind of "anti-hog-cholera serum" (that is the protective substance obtained from the blood of hogs made hyper-immune to cholera) is used in both methods. In the **"serum alone"** method as the name indicates, nothing is injected into the hog except the "protective serum" which does not contain any virus or disease producing substance, and the hog does not get sick from the vaccination. This gives what is called a "passive immunity"; that is, it is not a permanent or "life immunity." The protective substances are gradually eliminated and the hog again is liable to contract the disease if exposed to it. The duration of the immunity in swine injected with "serum alone" varies, according to the strength of the serum and the condition or individuality of the animal injected. In the practical application of the method the immunity usually runs from sixty to ninety days. This is sufficient time as a rule to carry out proper measures of disinfection. But in some cases it may be deemed advisable to prolong the immunity period in a herd by a revaccination, if further time is needed in carrying out proper measures of sanitation, on all infected premises in the neighborhood. The important point the farmers must keep in mind is not the permanent immunization of all the hogs they raise but the eradication of the germs of the disease or virus of hog cholera from every farm in the neighborhood, and this can be done by the use of "serum alone" for temporary protection, and proper co-operation in carrying out quite simple, inexpensive and effective sanitary measures on the farms and small stockyards in the neighborhood. It will not be necessary, as has been charged by the commercial serum man

Great Western Low Down Spreader

Is the easiest to load. Saves back-breaking strain of lifting over high wheels. **Lightest of draft**—short wheel base—roller bearings—front wheels cut under—turns in its own length—simple drive—lowest upkeep cost.

The Great Western has made good for more than 14 years. Over 100,000 satisfied users in all parts of country will tell you that the Great Western means dependable service and money saving durability.

referred to above, to vaccinate 4 to 6 times a year. In fact no vaccination at all will be needed on most of the farms in the neighborhood, if my plan of "simultaneous sanitation" is applied. And on the farms where even "serum alone" is deemed to be necessary only one vaccination, or at most two will be required, and that will be far cheaper than to attempt to establish and maintain a permanent or "life immunity" in the herd, by the "simultaneous" or "serum-virus" method of vaccination; for such an attempt means the permanent infection of the farm, and the continual tax of semi-annual vaccination of each new crop of pigs, and an annual revaccination of the breeding herd. Moreover a danger focus is maintained on such farms from which cholera is liable to be spread to neighboring farms, as will be seen when this method is more fully described. In my next article I will discuss the Simultaneous or Serum Virus method of vaccination.

A BIGGER OAT YIELD

Have the farmers of Missouri made any profit on the oat crop in the last five years? Below thirty bushels per acre will not pay expenses and if the oats do not bring a good price it will take more than thirty bushels for the farmer to come out even. If we go back to 1909 and take the statistics for the whole state for the six years the average yield of oats in Missouri has been 25.4 bushels. In that time we have had three extremely dry years which cut the yield very much. If we take then only the three best years in the six we find we made an average yield of only 30.5 bushels as compared with an average of 20.3 bushels for the three drouth years. All these averages are really too high because it is the rule of the state board of agriculture to estimate only the part of the crop harvested for thrashing. In dry years many acres pastured and cut for hay would yield less than the average and hence the real average is below the official figures.

I shall not discuss the effect of the season on the yield of oats because that is not a factor we can control. The soil is another factor that is very important but little can be done along that line between now and oat sowing time except to thoroughly prepare the seed bed. I know some farmers say that "hogging" in a crop of oats is just as good a plan as any but I would not want to risk it. With new land or land in a good state of fertility and full of humus so that it does not run together it may sometimes do as well as any to "shovel in" the oats but on most of the old land a thoroughly prepared seed bed will produce much better results.

In this state the oat crop is often cut short by hot and dry weather in June or the crop may be injured by rust. For this reason we should sow early maturing varieties. The Kherson and Texas Red Rust Proof are two of the safest varieties to sow. The latter variety is one of the best rust resisting varieties we can grow. Few farmers appreciate the value of a good fanning mill in the selection of seed oats. Various trials have been made in Canada and in the United States which have proved the superior value of the heavy seed. We can not select our seed oats by hand like we do seed corn but we can discard the light seed by the use of the wind mill.

Where the seeding is a little late it is best to sow with a drill. It takes less seed with the drill and the drilled oats will withstand dry weather better than the shallow covered grain sown broadcast.

Perhaps the greatest mistake Missouri farmers are making with the oat crop is in their neglect to treat the seed for smut. Smut seldom destroys a crop entirely and on the other hand it is hardly possible to find a field of oats any year without considerable smutted heads. It is very common to find 10 to 25 per cent of the heads destroyed. There is no excuse for this whatever because we can prevent the smut at very little cost and labor by treating the seed with commercial formalin which costs only about 50 cents a pint and this is sufficient for mixing with 40 gallons of water and will treat several bushels of oats. The usual method is as follows:

"Mix one pint of commercial formaline with 40 or 50 gallons of water in barrels or other convenient vessels. Formalin may be obtained from any drug store. Immerse the oats in this solution, stirring well so that all will be thoroughly soaked. Pour off the solution, dump the oats out and stir occasionally until dry. Another method employed is to sprinkle the oats with the solution until they are well soaked, and then heap them up in a pile and cover with blankets or sacks. Leave them in this pile for five or six hours, or even over night, and then spread out to dry. Stir frequeutly until thoroughly dried, after which they may be sacked and set aside until seeding time.

"Machines for treating oats and wheat for smut are on the market. In these the grain is passed through a tank containing the formalin solution and then dumped out on the floor to dry. Such machines are not expensive and are very satisfactory.

"Formalin is poisonous, but in this weak solution it will not injure the hands and is perfectly safe to handle. Since the formalin volatilizes rapidly, oats thus treated that are not needed for seeding may, after thorough drying and airing, be safely fed to stock."

How to Burn Cholera Carcasses

The burial of hogs dying of cholera is not advised by the department of animal pathology at the Nebraska Experiment Station. The germs of the disease will last a long time in the earth under favorable conditions and are liable to cause a new outbreak. The safest way to dispose of a carcass is to burn it.

Burning may be easily accomplished in the following manner: Dig two trenches a few inches deep intersecting each other at right angles. At the intersection of these, cornstalks, cobs, or other fuel may be laid. Over the trenches may next be laid strips of metal to support the carcass. Before being placed over the supports, the abdominal and thoracic cavities should be opened and be liberally sprinkled with kerosene. Then the hog should be placed belly downward over the fuel. As soon as the material in the trenches is ignited, it will rapidly spread to the kerosene and fat and the body will be quickly consumed.

If a large iron wheel is handy, it may be substituted with good results for the trench and iron bars.

Beef Situation Not Alarming

Although the beef cattle situation in this country is much disturbed, Dean C. F. Curtiss of Iowa State College does not see any occasion for alarm. He believes that out of the uncertainties will come the establishment of the beef industry on a sound basis, as a regular feature of successful farming and largely independent of the speculative features that have attended buying and selling of cattle in the past.

"We must continue to produce live stock as the chief output of the American farm," says Dean Curtiss, "because it is essential to the permanency and prosperity of agriculture. Our people might get along without home grown meats, but our farms would not thrive long without growing live stock to help maintain soil fertility. Where a comparison was made in Iowa, stock farms produced an average of 14 bushels more of corn, 8 bushels more of oats and 1 ton more of hay per acre than grain farms of the same type. The average income from stock farms in Iowa is $8.88 per acre and from stock farms, $13.17. The profits were even more largely in favor of the stock farms."

Every farmer who sends us a dollar for three years subscription makes it possible for us to give our readers a better paper. It takes more than "good wishes" to carry forward a good idea in this world—and the men worth while in any community are the men who help—who do their part in every good cause.

Studebaker
WAGONS BUGGIES HARNESS

WHY IT PAYS TO BUY A STUDEBAKER

I am using a Studebaker Farm Wagon which has been in constant use for 35 years. The wagon was bought from J. D. Lester by Fred. Gruner and was used for hauling grain to Telena, fifteen miles away.

I bought the wagon from Mr. Gruner and have hauled as high as 50 bushels to the load.

The wagon has been in several runaway accidents but has never had a broken wheel or axle, nor has a new felloe or spoke been put in.

The wagon is in excellent condition and is being used every day.

C. E. Stephenson,
Atwood, Ill.

Hauls his grain to market in 35 year old Studebaker

HERE'S a Studebaker wagon that has had hard usage for thirty-five years, served two owners and is still on the job.

And this isn't an exceptional Studebaker, for we have thousands of testimonials telling similar stories about the long life and good service Studebaker wagons have given.

Why Studebaker's Last Longest

These many long lived wagons are the result of Studebaker superiority; a superiority which comes from the long ageing and weathering of the timber, tested steel, the splendid standardization of the manufacturing processes and the rigid requirements of test and re-test through which each wagon has to pass. Even Studebaker paint and varnish is analyzed before it is used.

But, remember, since paint can make all wagons look of equal quality, *appearance* is a most deceptive thing. And that since the cost of a farm wagon is in direct proportion to its length of life, that wagon is the *cheapest* that can *prove* the longest average term of service.

To make sure you will get a lifetime of service, buy a Studebaker. You will never regret having bought it.

Studebaker Buggies and Harness are also built to outlast others.

BETTER FENCES, MORE LIVE STOCK, GREATER PROFITS

Fifty per cent of our Missouri farms are not fenced as they should be, fifty per cent of our farms are not stocked up with live stock as they should be to return to the farmer the greatest profits. Every farm should have a hog-tight and horse-high fence all around it, and should be fenced off in ten to forty acre fields according to the size of the farm. All the cross fences should be hog tight and horse high so any kind of stock can be turned into the fields. The different fields should be so arranged that stock can be turned from one field to another by simply opening a gate. By having our farms thus fenced we can at all times get the full benefit of our crops and the growth of grasses. We often have storms which blow down our grain in the fields and leave it in such shape it can not be harvested, and if our fields are fenced as they should be and we have the proper amount of live stock on the farm that we should have, and are ready to turn in on these damaged crops, we will receive almost the full benefit of them. There is always more or less grain and other feed crops left in the field after it has been harvested, and then if you have a bunch of pigs, sheep or other live stock you can always clean up a field after it has been harvested and a nice little profit be derived from this cleaning up.

The time is here when no farm can be successfully handled without a sufficient amount of live stock to consume all the feed stuff raised on the farm. A farmer who raises grain and hauls it to the market reminds me of a wood hauler who buys himself a good team and a good new wagon and set of harness and starts to hauling cord wood to market, hauling from one to one and one-half cords at a load. He makes very good wages and a little money for a year or two, but soon his team becomes worn out and his wagon is worn out and neither team nor wagon is able to carry but a common wagon-box full of wood to town and the wood hauler has not made enough clear profit to buy another team and wagon, and all he can do now is to chop up a wagon-box full of stove wood and haul it to town to buy a few groceries for the family. The same thing has happened and will continue to happen with the farmer who does nothing but grow grain and other field crops on the farm and haul them all to market. Your good fresh farm will produce you good crops on the start and you will make some money for several years, but by and by the good farm land will become poorer and poorer until the crops will not pay the expense of trying to grow them. The expense for hauling the crops will not be much because you will not have much to haul away. A few years later all you will have to do is to dig a few sassafras roots and gather a few dew berries and carry them to town to get a few groceries.

There is only one way to run a farm without live stock and that is to bring back on the farm five tons of good manure for every ton of grain and feed stuff you haul off of the farm. There is a great deal of pleasure and education in growing good grain and other farm crops, but there is just double the pleasure and education in growing both the crops and the live stock at the same time.

The time is here and always will be, when any kind of good live stock will pay well to breed and grow on the farm. There is good money in breeding and raising cattle, there is good money in breeding and raising horses and mules, there is good money in breeding and raising hogs and sheep. I know a few men who do nothing but raise grain on their little farms and feed nothing but geese and turkeys and they are making their farms better and making good money.

The low price for meat is gone never to return. So you can choose the class of stock you like best and breed and raise them at a good profit, but it is a very good plan for the average farmer to breed and raise a few of each. Cattle and hogs go well together on the farm, and the different kinds of livestock all do well in the same pasture and go very nicely together on the farm. Cattle and sheep will eat a great many weeds and grasses which horses do not like and the hog comes along and cleans up all the waste grain which has been spilt in the mud. So all the livestock work hand and hand on the farm and each one makes a little good easy money for the owner and at the same time it is building up the farm and making it better from year to year.

By the way, I almost forgot to mention the animal that is the greatest money-maker on the farm. It is nothing but a few good jennets. I have bred and raised nearly all kinds of good livestock on the farm and all have made some good money, but the old jennets have made more good easy money than anything I have ever handled.

I have a neighbor (and a fine family they are)—eight girls and three boys and a good father and mother. The father happened to get hold of a couple of good jennets about the time his oldest daughter was sixteen years old. The old gentleman took good care of these two jennets, bred them to the best jacks he could find, and by the time his oldest daughter was ninteen and was going to get married the old gentleman had raised a splendid young jack. He sold the jack for $1250, gave the bride $1000 and had $250 for the wedding expenses. And as the remaining seven daughters became old enough and married off the good old father had a jack to sell each time and gave each daughter $1000 for a wedding present. This good old gentleman had only a small farm and he has told me several times that if it were not for the two old jennets he never would have been able to so happily marry off his daughters.

L. M. Monsees, Pettis County.

The Telephone Unites the Nation

AT this time, our country looms large on the world horizon as an example of the popular faith in the underlying principles of the republic.

We are truly one people in all that the forefathers, in their most exalted moments, meant by that phrase.

In making us a homogeneous people, the railroad, the telegraph and the telephone have been important factors. They have facilitated communication and intervisiting, bringing us closer together, giving us a better understanding and promoting more intimate relations.

The telephone has played its part as the situation has required. That it should have been planned for its present usefulness is as wonderful as that the vision of the forefathers should have beheld the nation as it is today.

At first, the telephone was the voice of the community. As the population increased and its interests grew more varied, the larger task of the telephone was to connect the communities and keep all the people in touch, regardless of local conditions or distance.

The need that the service should be universal was just as great as that there should be a common language. This need defined the duty of the Bell System.

Inspired by this need and repeatedly aided by new inventions and improvements, the Bell System has become the welder of the nation. It has made the continent a community.

POTASH FOR FERTILIZER

I am not quite willing to accept the dictum of those who do not see any danger in the cutting off of our potash supply by the European war, as twelve years or more careful experimentation and observation has made me a more extensive user of potash every year.

Some years ago while at institute work in a northwestern state, I frequently heard the college men say that potash does not increase crops on our soils, yet in a dozen or more institutes men said that they had increased the yield of potatoes 50 to 100 per cent by the use of a few bushels of wood ashes per acre.

In a southern state I saw cotton at the rate of a bale to the acre growing on a strip where a fence had stood two years and was accidentally burned down, while outside this fence row the cotton would not make more than a bale to four acres.

That was about the time that kainit was loudly exploited as a remedy for cotton wilt, and I saw that regardless of its value for this purpose, every dollar spent for kainit returned three to six times its value in cotton.

Again in one sawmill district south I found one man who hauled all the ashes he could get within four or five miles, applying them to his cotton land and that man trebled the yield of those about him who stuck to that universal southern formula—2—8—2.

Of course the ashes contained a small percentage of phosphoric acid and lime, but it was the 3 to 5 per cent of potash that was mainly responsible for the increased crop yields.

On my own farm I have been experimenting with potash for fourteen years, or since 1901, and from the results attained on all crops, wheat, oats, corn, tobacco, garden stuff and berries, potash has always paid us several times its cost.

For three years past I have used a 2—6—6 on nearly all my corn crop, at the rate of 100 to 150 pounds per acre according to the quality of the soil, and have enough of that grade contracted for use on my crop this year.

Every year we have checked our work with 16 per cent acid phosphate, 2-8-2 and other formulas, all giving good returns, but the more potash the more crop in all cases. C. D. Lyon.

Built Like a Hand

There are many practical reasons why this "Dan Patch" is the perfect driving glove.

There is your size with snug fit and complete protection yet built to give bare-hand freedom.

Hansen's Gloves

have proved for thousands of farmers that work can be done best, easiest and fastest when hands are in healthy, happy condition—and for this you need Hansen's.

Our 500 styles include gloves for women and boys. All should know the joy and *saving* of a Hansen. At your dealer's or ask us.

CARE OF THE COW AND CALF

Starting with the cow six or eight weeks before time to calf, I turn her dry, during which time I see that she has plenty of nourishing food, as well as good shelter during the winter months. Of course if she is dry in the summer and the pasture is good, she could not do better, but if the pasture is poor I bring her to the barn and feed her with the cows that I milk, or if dry in the winter I feed her the same as the cows I milk with the exception of grain, which I do not feed so heavily. I feed the cow the same kind and quantity of feed for two or three weeks before calving, until three or four days afterwards, when I commence to increase the feed according to the amount of milk she gives.

When the calf is born I give it a chance to suck two or three times, unless a heifer with her first calf, when I leave it with her a day or two. Then I take it away and shut it up out of the mother's sight, and turn the cow with the others to be milked.

By handling the calf this way I find that the mother does not worry or miss her baby like she does when the calf is allowed to suck her longer. In a great many cases you would never know the cow had had a young calf. After the youngster is once taken away, I never let it get back to its mother but endeavor to keep the cow quiet and comfortable so she may turn all of her energies to producing milk.

Sometimes the calf refuses to drink from a pail at first but I persuade it by letting it suck my fingers until I can work its head into the pail. After it has once got a taste of the milk there is no more trouble. Oftentimes the first day they are stubborn and will not try to suck your fingers or drink, but in that case I just let them go until they get hungry, which will not be longer than twenty-four hours.

I give the calf for the first three weeks its mothers warm milk or until it will eat grain such as bran and corn chop with a little oil meal. Then I gradually change from whole milk to skim milk and continue with the skim milk, grain, hay, or grass until it is five or six months old.

The amount of milk fed at one time is governed by the size of the calf, which will run from six to ten pounds at a feeding, for Holsteins. After the calf has become accustomed to the sweet skim milk there will be no bad effects from feeding sour milk, yet I believe sweet milk is better.

By handling my cows and calves in this way I have had the best of success. While it is more work to milk all the milk and feed the calf, the difference in the increased milk production will more than pay for the extra trouble.

Then again by feeding the calf skim milk, which can be skimmed with a separator or stand and skimmed by hand, you get the butter fat from the milk which is not essential for the growth of the calf, especially after it begins to eat hay and grain.

I had a heifer that found her first calf about noon the 20th of May. She was brought to the barn at night and milked, and turned out with the other cows until morning when she was put in with her calf, which had been kept up. The calf was allowed to suck all it would, then the mother was put in the barn with the other cows and milked and not put with the calf again, but turned out to pasture and handled the same as the cows giving milk. From that morning on she has not fretted or bellowed for her baby and has given her milk down like an old cow.

The main thing with the cow is to make her give profitable returns for the feed she consumes. If the farmer would raise the calves by hand he would be dollars and cents ahead. Of course it is easier to let the calves do the milking but at this stage of the game we should not look for snaps.

H. T. Hook, Columbia, Mo.

MUST SAVE WHAT WE MAKE

Why does not the other business of the world pay? During the year 1913 something like twelve per cent of the business ventures of this broad land of ours proved a success according to Bradstreet's report. I believe a greater

Farm Home of Frank B. Brummett, Jasper County

percentage of our farms are on a paying basis. Let us determine this fact from our own neighborhood. Let us stop and ask ourselves this question: "If not nine times out of ten the farmer is not at fault instead of the farm?" We can all find farmers in our own neighborhood who are very successful while others are only holding their own, and still others going behind year after year. It is so with all our business men throughout our land.

Perhaps the worst evil among farmers at large, especially of the Corn Belt, is of a continued cropping of the farms year after year without returning anything back to the soil. We are continually taking from it year after year and not putting anything back. Here in Southwest Missouri I can show you farm after farm that has been cropped constantly for forty, fifty and some sixty years with nothing returned to their fields, and yet the owners expect a bounteous yield from their acres each year. It has been stated the quickest way to get an automobile is to go in debt for it and buy a manure spreader with the cash.

We, of the present generation, must see to the restoring of the fertility of our soils or the next generation must go hungry. We must do so by keeping more live stock, more legumes and a more careful saving and application of our barnyard manures, coupled with a systematic rotation of crops. In another thing the average Western farmer is too wasteful in his farming operations. Our Eastern brothers tell us we waste more than they raise. For example an Eastern man rents a quarter section joining me. He came to Jasper County about twenty years ago with less than one hundred dollars. He worked as a farm hand for a period of four or five years at $15 and $16 per month, including board. By saving his money about fifteen years ago he purchased a team, wagon, harness, a plow and cultivator and started farming for himself. On this prairie farm he saves everything he raises and today he is worth ten thousand dollars. This man raises no better crops than some of his neighbors but he takes care of all he raises.

One great problem to us farmers is the help question. Other lines of work can pay a greater wage with shorter hours. However, I believe if the farmer will put the same amount of get up and hustle, combined with the same business principles as the successful business man, he will make the farm pay, remembering "the farmer must provide for all."

Frank B. Brummett, Jasper County.

The Plow That Insures You Moisture

The Rock Island "CTX" Universal Plow is the best crop insurance you can buy. It's the only plow that leaves no air spaces to cut off moisture from below. In dry weather, water comes up from below to the plant roots just like kerosene comes up your lamp wick. Air spaces have killed many a crop but they won't kill yours if you use

Rock Island "CTX" Universal Plow

On account of its peculiar corkscrew-like shape, the "CTX" goes into stubble, tame sod, trashy corn ground, tough gumbo, heavy clay, etc., and does perfect work in all. Turns the slice *clear over*, lays it *flat* and *buries all trash*. You don't need extra bottoms for the "CTX." This wonderful plow pulverizes the soil so much better that you save at least one harrowing.

Free Plow Book shows how the "CTX" increases yields from 2 to 10 bushels per acre. Write for it.

Rock Island Plow Co. 554 Second Ave., Rock Island, Ill.

International Harvester Manure Spreaders

"WHEN I bought my first manure spreader, I was thinking more of my horses than I was of my land. I bought a 'light weight' machine. It went all right empty, or with a half load, but it warped and jammed so after a few full loads that soon the horses couldn't move it. A spreader must have some weight if it is to do good work and last any length of time. The spreader I own now is what some might call a heavy machine. The beauty of it is that it neither warps nor jams and it works as easily when fully loaded as it does when nearly empty. As my neighbor said when he bought one like mine, 'I could spread soft coal with it.' I find it is much better for the horses, better for the land, and better for my pocketbook."

This farmer owns an I H C manure spreader built for efficient work, and field-tested in every feature. The weight is put into places where weight counts. It helps to make the machine stiff and strong. It prevents jamming, twisting, warping and sagging.

See the I H C local dealer who handles these machines and let him show what the features on I H C spreaders are put there for. Or, write us for information and we will give you our dealer's name.

Horses & Mules increase in value when Clipped

Not only in selling price but in working value. You don't go at the spring work with your winter clothes on—then why expect the horse to do so—he feels the warm weather just as much as you do. Clip off his heavy coat that holds the wet sweat and dirt. It will give him new life and energy. He'll rest better, feel better, work better and repay you many times for the little it requires to clip him. Pays also to clip the udders and flanks of your cows—prevents dirt from dropping into the milk. The best and most generally used clipper is the

Stewart Ball Bearing Clipping Machine

Insist on having the Stewart, the machine that turns easier, clips faster and closer and stays sharp longer than any other. Gears are all cut from solid steel bar. They are enclosed, protected and run in oil, little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head. Highest grade. Get one from your dealer or send $2.00 and we'll ship C. O. D. for balance. Money and transportation charges back if not satisfied. Price only $7.50

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always enclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

LET'S START RIGHT

If there was ever a time when a good crop was needed to put farmers in good shape that time is now. Three out of the four previous years we have had short crops and many farmers have used up their bank accounts or have borrowed money to buy feed to hold what stock was necessary to run the farm. Everything points to good prices ahead for both grain and live stock and the man who makes his best effort this year stands a good chance to win. The first step should be to see that no manure is left scattered about the barnyard, making things unsightly. Every good load of manure spread on the corn ground will add several bushels to the crop gathered next fall. No work on the farm pays any better than the careful saving and spreading all the manure produced.

We will not start right if we hurriedly and carelessly prepare the seed bed. With both oats and corn we think it is a common fault to hurry the seeding and neglect the thorough pulverizing and packing of the seed bed. With a soil full of humus and with plenty of fertility this thorough working is not so essential and it was on this account that the farmers of new land got into the habit of carelessly preparing the soil for the reception of seed for spring crops. Many farmers have found that a good disking, once or twice before plowing the corn ground is about the most valuable work they can do. This plan not only fines the soil that is turned to the bottom of the furrow but the disking makes the plowing a little easier on the teams and the ploughman will just naturally let the plow run a little deeper. For corn in particular we think it pays to plow deep. Deep plowing and thorough pulveriznig the soil makes available more plant food for the corn roots and it gives a greater water holding capacity to the soil which of course is a good thing in either wet or dry years.

Good seed is one of the essentials to a good crop of any kind. We do not believe one farmer in a thousand treats the seed oats to prevent smut in face of the well known fact that smut causes a loss on oats every year of anywhere from 5 to 25 per cent of the crop. And oats may be treated at a cost of not more than fifty cents and a day's labor for ten acres, but in face of this fact farmers go ahead and sow the untreated seed and sustain the loss of one to ten bushels per acre.

The man who plants seed corn in the year 1915 without making a germination test of his seed has not started right for a good crop. It is true the germination test will not prevent mice, moles and cut worms from destroying the corn but there will be a better stand of corn left after these pests get through if you have a perfct stand to begin with.

The average crop of corn will not show much above three-fourths of a stand and the average yield is hardly thirty bushels. A full stand on this basis would promise forty bushels where we now get thirty bushels. That extra ten bushels from the whole acreage planted in Missouri would mean a great many more fat pigs, lambs and calves to market next winter. It would mean all told about seventy-five million bushels of corn or about half that many more dollars which would make a right nice little Christmas box for every farm family in the state.

—o—

THE BEST FOR MISSOURI

If every man and woman in Missouri were to adopt this slogan and live up to it in every way what a great state this would soon be. It is a good slogan for the individual and it is just as good for the community, for the county, the state and for all our state institutions. It is impossible for us to raise the best corn and wheat without we keep the best of our crop for seed and likewise we can not produce the best cattle and hogs unless we are wise enough to keep the very best animals for breeders. We can not maintain the best schools for our children unless we employ the best teachers to manage them.

Salaries of professional men may appear high when compared with the meager profits of farming and I believe there is just ground for criticism along this line but the fact remains that we must meet the prices offered in other states for our best men or else be satisfied with scond-class men. The point we want to make is that in any line of work the state takes up we should aim to do the very best work or let it go altogether. In the past Missouri has been very short sighted in permitting other states to take away some of her ablest and best trained men just because others could appreciate real worth more than we have.

In what we have said we do not want to be understood as favoring a higher standard for professional and official salaries than all other states. It is our candid opinion that the general level of both official and professional salaries is already too high when compared with the profits of business men and farmers. We do not hesitate to say that we believe nine men out of ten now holding public office or holding a professional position under state or government salary are being better paid by twenty-five to fifty per cent than the same class of men are getting out of any business line. But granting all this we think a wise course for us to pursue in Missouri with our schools and other public institutions is to hold our best men and particularly Missouri trained men no matter if we do have to meet higher salaries. What we need here in Missouri is more state pride—a Missouri spirit—and a determination to make Missouri, no matter where nor how it is applied, stand for the best. This spirit should begin with the individual, the school, the church, the community and reach up to the larger institutions and to the state as a whole.

—o—

ANOTHER VIEWPOINT

Every man has his own viewpoint biased more or less no doubt by his environment and self interest. We are led to the point of writing these lines by reading the report of the board of curators of the State University to the 48th General Assembly in which the board sets forth the needs of the institution as they see it. We frankly admit the president and the board ought to know and do know more about the needs of the University than any outsider but this is not saying they know more about the needs of the state or of any class of people in the state. Practically one-half of all the people in the state of Missouri are engaged in agriculture but when we look over the names of the distinguished men who compose the board of curators of the State University we find only one man identified with agriculture. It is not a surprise then that the board of curators, no matter how sincere they may be, should fail to get the viewpoint of the farmer. In studying carefully the recommendations of the board of curators we learn they are asking of the Legislature for improvements, extensions, betterments and buildings in the Agricultural College the sum of $211,500. Out of this sum less than one per cent is asked to give help to farmers where they have sustained their greatest loss.

If any year ever demonstrated beyond question just where the University could be of greatest service to the farmers of the state that year was 1914. Insect pests and live stock diseases caused a loss to Missouri farmers last year of several million dollars. While last year was an unusual year there has not been a year in the last ten that the loss sustained by these two sources could it have been saved, would have paid the entire expenses of our state government. The control of orchard pests, the army worm, the Hessian fly, the chinch bug and other devastating pests of orchard and field crops is of greater importance to the state than all the work the University has ever done or ever can do in crop production or in animal breeding. The control of live stock diseases will save the farmers of this state annually more money than the State University and all our normal schools receive from the state.

We are not offering any objection to the various sums the board of curators recommend for other purposes but we cannot understand why they have overlooked the first and by ten times the greatest need. Last summer when the army worm was destroying our crops at the rate of many thousands of dollars every day and when the chinch bugs and Hessian fly were doing a greater damage to crops than the drouth, farmers from every quarter in Missouri were writing, telephoning and telegraphing for help, quick help, but what could the University do? Nothing. The great University of Missouri employs one man with two assistants to do the teaching and investigation in entomology, inspect all the nurseries and give the farmers help when help is needed. Does the University tell us this is a farmers' problem? If so we answer we can handle all our other problems and we need not look longer to the University for help. It is time the board of curators were enlarging their views and waking up to their opportunity. Insect control work must be carried on in a big way to be effective. It must be from a state-wide standpoint or it will amount to nothing. The entomologist must have men and means to get out into every infested district of the state to organize and carry on this work. The breadth of view of the board of curators on this subject is measured by the amount of money they ask for to carry on the work—only $2000 for insect control as compared with more than $200,000 for other less important work.

All we have said above about insect control is equally applicable to the importance of the work with live stock diseases. It is safe to say that we have sustained a loss of $5,000,000 a year in Missouri for the past five years. The greater part of this has been due to the loss from hog cholera but the board has not asked for a dollar outside of regular maintenance for the eradication of hog cholera. Two or three counties are being organized and the work has gone far enough to show that the loss from cholera can be reduced to a very low minimum in six months time with the proper organization but to organize all the 114 counties of the state in a short time will cost something. Suppose it cost a million dollars and stopped this loss it would be like opening up a rich gold mine. We trust the Legislature will take a bigger view of these things than the University does and will give the money so badly needed for this work.

A WORD TO OUR READERS

During the last 30 days, renewals to The Missouri Farmer have been pouring in in fine fashion and this is to appeal to YOU, kind reader, to do likewise if you have not already done so. The price of three years' subscription for one dollar to a paper like The Missouri Farmr is so small that, in the near future, we are going to be compelled to withdraw it and charge the full 50 cents for each year. To this end, we trust our readers will send in their dollar at once when their subscription will be marked up for three full years. A check, or a dollar bill sent at our risk—either one is satisfactory.

The Missouri Farmer is your paper. It will be just as fine and splendid as your support enables us to make it. It is fighting your fight. It is trying to help you make more money in order that you and your loved ones may enjoy more of the good things of life. It stands for Better Farming, Better Farm Homes and Better Citizenship. It tries to bring a little more sunshine into your home and into your life—and isn't such a Messenger worth the small sum of 33-13 cents per year for three long years? Do you get any other farm paper which stands for these things in the clean, wholesome way in which The Missouri Farmer stands for them?

We want you in "The Missouri Farmer Family." It is getting bigger all the time—and during the next year we are going to discuss scores of questions in which you will be vitally interested. During the recent "Farmers' Week" at the Agricultural College, several thousand farmers were in attendance from all over Missouri—and over 80 per cent of them were readers of The Missouri Farmer. They are the kind of farmers who want to "get somewhere"—who want to "win" and who believe in supporting a real Missouri farm paper. So send us your check or a dollar bill right away and thus get the benefit of the three years' price. In return, we promise to make The Farmer better and better.

WILLIAM HIRTH, Publisher,
THE MISSOURI FARMER,
Columbia, Mo.

MUST KNOW OUR FARM

Why doesn't the average farmer make more money?

In the first place, because he does not sufficiently mix brains and soil.

In the second place, he does not understand his farm, fully comprehend the kind of products to which it is best adapted.

In the third place, he is wasteful in the expenditure and care for the machinery used on his farm.

In the fourth place, he is too indifferent in the selection of stock and the care he takes of them.

In the fifth place, he robs the soil with no thought of ever paying back.

In the sixth place, his farm work drives him and he never drives his work.

In the seventh place, he has poor fencing, inconvenient lots for his stock, rickety, leaky, tumbledown barns and sheds, if any at all, for his stock during the inclement weather.

In the eighth place, his slip-shod manner of doing business compels him to sell on the cheapest market and buy on the highest.

These are some of the reasons why an industrious, hard-working farmer does not succeed. A lazy, indolent man is not supposed to succeed at anything, and we do not take him into this calculation. There are, however, many industrious, hard-working, clever, honest men who are most glaring failures. It is of the latter that we propose to speak. The time was that if a man had several sons, he selected the brightest of them for either lawyers, doctors or the ministry. They must take up the "learned professions." The dullest was universally relegated to the farm, and this curse was as imperative upon the poor fellow as the curse of slavery upon Ham by his tyranical father, Noah. And this did very well in the early settlement of this country, when the products were corn, wheat and oats, which with a very scant covering of the rich, verdant soil would bring forth fabulous crops, rivaling the valley of the Nile. And then the large ranges for cattle, horses, etc., and abundant mast for hogs, wild game in profusion, and the most luscious wild honey, the finest fish, venison and buffalo; it was a very ignorant man who could not procure a living on the farm, furnished with the rarest delicacies in the way of meats, wild fruit and game, wear his buckskin trousers and vest, his buffalo overcoat and shoes, his coon skin cap, and sell furs enough by trapping to pay his taxes, buy his wife a calico dress, while she made the wool up into good old-fashioned linsey-woolsey garments for the family.

That day is among the things that were, and the farmer is no longer a side issue, but is to be recognized as a man of as much, if not more intelligence, than a great many of the learned professions. A successful farmer must be possessed of a great deal of that very precious article known as good, common, hard "horse sense," an article of which this country has no surplus to throw away. The man who has that will always be on the alert, never too bigoted to learn from others and profit by good advice whenever he finds it. He will ascertain the nature of his soil, its topography and adaptability to certain crops, how to prevent the erosion of that soil, how it may be improved at the same time it is growing most profitable crops.

We recall a farm near by that had been cultivated in corn for perhaps twenty-five years continuously until

the corn element in the soil had been almost completely eliminated. The owner had borrowed money from the county but was unable to pay it. His neighbor, who had gone on his bond, bid it in for just the debt. It was in corn, smart-weed, foxtail and cockleburs. Instead of trying to cleanse the corn of this poisonous vegetation, he put his plows in and turned every particle of green vegetation under so deep the sun never shone upon it again. The fall following he prepared a good bed for wheat, then put it in, and in the February following sowed clover over it. He harvested thirty-five bushels of wheat to the acre. In the fall, just before frost, he turned that clover under. In the following spring, he put in a crop of corn that yielded eighty bushels to the acre, and after harvesting it, sold the land for more than double what he paid for it. He rested the land, fed it and rotated, mixed brains with soil, and it paid. Made two good crops with no more labor with either than the former owner, with four times the yield in value, and made the land sell for twice as much.

Again, a farmer from Ohio came into the neighborhood. He wished to rent a small farm, not more than forty acres, as it was spring and he didn't care to raise anything but corn. He could not get less than eighty acres. His neighbor agreed to take forty acres off his hands, but said he could just as well cultivate it himself. He thought not, went to work, put the forty in fine cultivation, selected good tested seed corn, put it in carefully, kept up a continuous cultivation with weeder, harrow and cultivator, and later in the season it became very dry. Others ceased to work their corn but he used the fine toothed cultivator, just as if it had been foul and needed cultivation for that, but he said it was to form a mulch to hold moisture. Now, as to the harvest; the neighbor who rented the forty acres from him and knew all about farming so that he could not be taught—no, not even by a "Farm Adviser"—raised thirty-five bushels; he who couldn't handle more than forty acres, but mixed lots of brains and enegry with it, raised seventy bushels, sold it all for seed at double the amount he had to pay his thirty-five bushel neighbor for corn to feed his stock. "Why does not the average farmer make more money?"

A Telephone Pays—Every Hour

It pays in MONEY. It pays in PLEASURE. It pays in TIME SAVED. Put in a telephone, and you can talk to your friends' homes in the evening for a social chat, or get the doctor *quick*, or call for help. You will never feel lonely or "away off" if you have a telephone. In the daytime you can call up the town and find out latest prices for crops, order supplies, ask the railroad about shipments, or talk over matters with neighbors. Why be isolated, cut off from everybody, when a

Western Electric
Rural Telephone

will put you "next door" to everybody, and save long drives through cold and wet. A FEW DOLLARS buys all this convenience. A FEW MINUTES' TIME taken to write us on how to secure good telephone service will put you in possession of full information. Write nearest house below and mention this paper.

WESTERN ELECTRIC COMPANY
Manufacturers of the 8,000,000 "Bell" Telephones

EQUIPMENT FOR EVERY ELECTRICAL NEED

Ride over this country, see the gulleys and washes on the farms, the erosion of the soil, the continuous raising of corn from one year to another without change or rotation, and then ask, "Why does not the average farmer make more money?"

Travel over this country, look at the broken down fencing, the dilapidated old barns and stables, and the lots with manure two or three feet deep, and in muddy weather the horses with sore heels and stiffened joints, while the manure over the farm would do good instead of harm; a wire-cut horse or a mule maimed for life, because of a neighbor's worthless cur prowling about over premises at night, and then ask "Why does not the average farmer make more money?"

Go to another farm, see a lot of stock, horses, mules, cattle and hogs, all being fed together in a muddy lot on the ground, a couple of mules, one at each end of a calf, trying to quarter it; a vicious bull goring to death a farmer's brood mare; then look at a harvester standing out yonder just where they finished cutting wheat; the mower, hay rake and baler just where they were last used, the cultivators, harrows, plows and other utensils in another part of the field, and is it necessary to ask, "Why does not the average farmer make more money?"

M. T. Chastain, M. D.
Saline County.

OUR FUTURE PROGRESS DEPENDS ON THE FARMS

Why doesn't the average farmer make more money?

This problem has been handed down to us for solution and the correct answer is of much importance to the coming generation. Agriculture is one of the greatest sources of wealth available to man. The happiness and future progress of all nations depend largely upon the farmer. Food and clothing, the initial and essential necessities to our existence, are to come to us only from this source.

The occupation seems to have been cast upon "Ancient Adam" as a sin. He was told to earn his bread by the sweat of his brow; and as a farmer I have long since learned that much depends on the brow and its sweat, as to the profits in agriculture. Deep thinking is quite as important as deep plowing. Care and management, the meaning of which contain all the secrets of the farm's financial success. So many things affect the farmer's income that once in a while losses occur under the best management.

The way a farm is equipped has a

D. B. Sailor, Buell, Mo.

lot to do with what it earns. Good stock, machinery, barns and silos are just about as necessary as the land to the man who would make money by farming. The way the farm work is done has a lot more to do with the income.

A farm on which the crops are rotated, the fields are well tilled, seed is carefully selected, manure is spread fresh from the stables, and legumes are freely grown and fed, will earn more than a considerably larger farm will earn on which these things are not done. In this farm income affair the man and his equipment count for more than acres do.

One big problem is to grow all the feed needed so as to reduce the expense for mill feeds to the minimum. All the manure should be carefully saved and returned to the land as soon as possible. Good feeding pays always, if we have good stock; but it pays best when lots of rich, sweet silage is one of the feeds used.

The farmer's profits are always contingent upon the successful marketing of his products, both of crops and the live stock.

He is continually confronted with disease and death in his herd. Oftimes years of toil are swept away in a brief space of time, which seemingly there is no recourse; but quick action and the swift marketing facilities make such losses less frequent now than in former years.

Blasted prospects by weather conditions, or swarms of insects devouring the crop may be averted or replanted, and with extra effort the land be made to produce a profit at the end of the year.

At first thought the year's farming operations may seem somewhat of a failure. Feeling this way, stop and ask: What is success? Is the most successful farmer—much as men admire thrift and busines ability—always the one with the largest bank account?

Remembering that the true measure of wealth is found in what we are worth to our fellowmen, is it not possible that the man with a mortgage on his land, but not on his life, may be the most successful in all the neighborhood.

Such questions are worth at least careful consideration.

D. B. Sailor, Montgomery County.

Wheat Started Well.

The last report of the U. S. Department of Agriculture shows an increased acreage of winter wheat sown this year over the previous year of 11.1 per cent. The general condition when wheat went into winter quarters 88.3 as compared with a ten-year December average of 90.2. There is also an increase in the area sown to winter rye.

The total acreage sown to winter wheat this year is 41,263,000 acres and for rye 2,851,000 acres.

In Missouri the wheat was sown rather late but in general it is in good condition, having been protected most of the time with a blanket of snow. Every available acre of cultivable ground should be planted to some paying crop next spring. If the people of Europe will fight we have a right to take advantage of the situation and sell them food at war prices.

Do You Have to be Shown?

I'm told that I have the best quality of seed, give the largest packages and have the most common-sense Seed Book in the bunch. And I'm willing to admit it.

Do you have to be shown?

All right. I live close to the Missouri line and I'll "show" you. I'll send you the *Seed Book* and a *package of garden seed*, and you can judge for yourself. NO CHARGE FOR EITHER, and you need not even send the postage unless you wish.

I also have guaranteed Clover and Alfalfa, and all kinds of farm seed at Farmer's Prices. Shall I send you free samples of these also?

COST OF SUDAN GRASS SEED

Sudan grass seed is too high. Last year the supply was small and the seed sold for $2 a pound. This year there is a sufficient quantity in the Southwest to sow between three and four million acres. As soon as the new crop of seed was available this fall, dealers rushed to local and state fairs with attractive exhibits of Sudan grass. They offered the seed for $1 a pound and urged farmers to buy at once because the supply would soon become exhausted.

With the large supply now in the Southwest, seed should not sell for more than fifty cents a pound. A number of contracts for large quantities last fall were made at twenty and twenty-five cents a pound. With the free advertising that the crop is getting from the U. S. Department of Agriculture, the agricultural colleges and in the agricultural press, a profit of 100 per cent should satisfy the buyers.

The Kansas Agricultural College reports that it secured a yield of 640 pounds an acre of Sudan grass seed. This yield at ten cents a pound would bring $64 an acre, ample returns for a crop as easily raised as sorghum. It is probable that in another year Sudan grass seed will sell at about the same price as that of millet.

Even at $1 a pound, farmers can afford to buy this seed and plant it in drills, using two pounds an acre. My advice is to hold off buying until near planting time unless seed can be secured at fifty cents a pound.—H. M. Cottrell.

IF $20 INCOME FROM ONE ACRE, HOW MUCH FROM 10,000 ACRES?

I was exceedingly interested in reading the illuminating article by Mr. George B. Ellis, Managing Editor of The Missouri Farmer, in the issue of that publication of December, 1914. It is entitled, "Twenty Dollars an Acre," and presents very clearly the possibilities of modern, scientific farming in the State of Missouri.

Mr. Ellis states that the "Missouri Experiment Station has conducted a series of careful tests to find out how much pork can be produced from an acre of pasture." These experiments, conducted on land admittedly rather poor, show that an acre of blue grass gave a gain of 324.6 pounds of live pork; clover, 567.7 pounds; and alfalfa, 591.8. These figures indicate the gain in pounds of live pork from the raising of blue grass, clover and alfalfa, per acre, over the pork production made from an ordinary average upland pasture. In other words, the hog who must grub for his living on ordinary pasture on the ordinary Missouri upland, will make that much less gain. Mr. Ellis then takes 6c per pound as the price to be received by the farmer for this pork. He admits that it has been "sometime since farmers sold hogs for less," and with the present scarcity of meat, not only in this country, but abroad, 6c is certainly a very conservative price.

But, figuring these gains at 6c, we find that an acre of land planted to blue grass, will yield $19.47 worth of live pork; planted to clover, $34.06; and planted to alfalfa, $35.50. These are conservative gains, per acre, that an ordinary farm of Missouri should receive, if carefully cultivated to these grasses. Mr. Ellis very pertinently observes, "Why go along in the same old way and be satisfied with an income of $9 an acre?"

It is from similar deductions that I based my arguments for the securing of Eastern capital. I felt that it was not only possible, but certain, to take these 38,000 acres which we had assembled, and by careful, scientific procedure, evolve a vast factory for the production of prime beef and pork at small relative cost. I had been in the live stock business all my life. I had managed one of the largest ranches in Texas. I had tried there to induce the owners to get away from the old ideas and adopt the new—without success. But now there are associated with me men who have **belief** and **confidence in** these **modern methods** of livestock farming.

A hog cannot give, in flesh, any more than it receives in nutriment. To be sure, it is a persistent and hard-working animal. The old saw, "Root hog, or die," illustrates its disposition. Turn a drove of any kind of hogs loose on the ordinary pasturage, unimproved, of a Missouri farm, and it will root out in some way a fair living. The hog thus situated will not grow as fast, but he will somehow make a living. But if you give him a chance at good alfalfa, he is going to make you about $35 an acre more than he would from his ordinary unimproved pasturage.

Now, my contention is this: One man with the experience and ability to handle 100 acres raising alfalfa-fattened hogs, can just as well manage, with success, a farm or ranch doing the same thing with 50,000 acres. We have only about 38,000 acres in our tract at present, but we propose to demonstrate this contention upon it.

A hog is simply a machine for producing pork—as viewed from our standpoint. Any machine, in order to give the best results, must be well cared for. It must, primarily, be a good machine. We are going to see to it that we have good blood in our hog herds. We propose to have a veterinary on the place, living there. We propose to give this pork-making machine every opportunity to produce results. We shall rotate crops of alfalfa, blue grass and clover, raise some corn and peas for occasional feeding, and proceed to demonstrate that one of the greatest money-making enterprises in all the world is a good piece of Missouri land, carefully conducted and producing pork and beef.

The time is past when slipshod methods in any line of manufacture can be permitted. This is the day of efficiency and efficiency engineers. The farmer, in order to be successful, must be efficient in his particular field. He must **know,** not guess. He can no longer proceed to do a thing because his "daddy did it." We must conserve every effort and every energy in order to make the profit we should from our land. For this reason, such publications as "The Missouri Farmer" and such careful analysts of the situation as Mr. Ellis, are of inestimable value to every Missouri farmer.

It seems to me that this is, indeed, a golden opportunity for the manufacture of beef and pork. You probably all have seen a recent statement by J. Ogden Armour, in which he says that "cattle receipts at the six principal Western markets have been shrinking for nine years. The receipts now are the smallest in thirty years. Since 1900 the population has increased over 25 per cent, while beef cattle declined more than 20 per cent. In the same period the slaughter of calves increased 600 per cent."

Continuing, he says: "There are **now** 38,000,000 head against 51,000,000 seven years ago. The prices have advanced so that the total cattle now represent $350,000,000 more than did the 51,000,000 in 1907. The time has come for all concerned—the packer, the farmer, the dealer, the consumer—to give heed to the menace of a growing beef shortage in this country, and to realize that **this situation will become more acute,** instead of improving, in years to come. There is no problem before this Nation today more important than the rehabilitation of the beef industry. The farmer must receive every practical encouragement to put the beef cattle back on his land and to conduct his business in such a way that the cattle and agricultural branches will be balanced, so that there will be an ample object in the success of each."

We not only face a threatened meat famine in our own country, but how are we going to supply the insistent demand sure to come from Europe? They there are now non-producing, and must depend absolutely upon other countries for their food supplies. If we American farmers are wise we will devote every energy we possess to making more available our land. We will see to it that this land grows such food for the hog or steer as will result most quickly in producing pork and beef.—Simeon J. Thornton, Pres. Mo. Cattle and Hog Ranch Company.

"Straight-away Pull" Saves the Team

Here is a harrow that cannot bind in the disk boxes. The above shows a true position of the disk in the Janesville and Budlong harrow. As you will note, the bearings set flat against the disk boxings—the wear on the spool is equalized—oil gets to all parts—bearings last longer—the team has less of a load to pull.

The illustration above is, as accurately as we can make it, a reproduction of what takes place in the disk box on the ordinary harrow. Side strain and twisting grind down one end of the bearing. This means short life for the bearings—possibility for breakages and needless expense for you. Ask your dealer to show you the

JANESVILLE and Budlong Disk Harrow
Manufacturers of Farm Implements

Note how the disks are hung so that they enter the ground like plow points. They get a straightaway pull from the drawbar—the only resistance is the cutting of the soil.

That's why our bearings last longer. And it's easy to see that it reduces the pull on the team.

We give you your choice of steel or wood bearings. All of our bearings are interchangeable, and we will replace any of our chilled bearings proving defective within the life of the machine.

We can give you any size disk—concave—plow cut—spading or cut-out—one or two levers—with or without tongue trucks and transports.

Write for Catalog

and read a little more about this work and money saving construction. You will find the same painstaking efficiency in Janesville plows, cultivators and corn planters, too. We have been building farm machinery for 56 years. Write today for literature helpful in your work.

Strawberry PLANTS **FREE** To introduce our *Pedigreed Everbearing* strawberries we will send 25 fine plants free. PEDIGREED NURSERY CO., St. Louis, Mo.

SWEET CLOVER SEED White and large biennial yellow. Prices and circular on request. Bokhara Seed Co., Box F., Falmouth, Ky.

SEED CORN As usual I have on hand a lot of fine selected pure bred seed corn including the following varieties: Yellow corn—Reid's Yellow Dent, Shenandoah and Gold Mine Mixed, Funk's 90 Day Corn, also White Cap 90 Day Corn. White corn—Boone County White, Johnson County, St. Charles, Iowa Silver Mine and Davenport and Boone County Mixed or Crossed. Prices per bushel butted and tipped by hand, graded over our screens and strictly tested, $2.40 per bushel; in 10 bushel lots, $2.30. These prices are F. O. B. Skidmore. The same corn shelled, butted and tipped by hand but ungraded, at $2.00 per bu.; 10 bushels or more $1.90 per bu. F. O. B. Skidmore. Sacks free. I have been in the seed corn business for years and have given hundreds of farmers a start in pure bred seed. Get in your orders at once because my supply will not last long.

A. F. HOWDEN - - - - Skidmore, Mo.

FOR LONG TIME FARM LOANS

F. D. Gardner, St. Louis

[In our previous issue of January 15 we gave the plan for rural credits outlined by Mr. Gardner and in this article we give the arguments he used before the Missouri Bankers' Commission in favor of the State taking action on this question.—Editor.]

The American farmer is producing ten billion dollars worth of wealth annually. He is borrowing 6½ billion dollars, and, according to the official statement of President Taft, he is paying (counting commissions) 8½% interest. This statement proves two things:

(a) That this production is the basis of all prosperity. And yet, after creating this vast wealth, the farmer has not only been denied the opportunity of financing himself from its first use, but he has been placed at the bottom of the list so far as the rate of interest he pays for money is concerned.

(b) The fundamental principle of economics is that a dollar spent which could be saved is not only a direct waste to the industry itself, but it is a tax on every other industry. Therefore, if the agricultural class is paying 8½% interest on 6½ billion dollars which by proper financial machinery could be reduced to, say, 5%, then there is a money waste of some 200 million dollars annually to the nation.

Our system of 3 to 5 year loans is discredited and archaic. It is inevitable that these loans must be renewed with the usual commissions, or that the farmer must sell part of his investment. That is to say, his capital must be reduced if the loans are to be paid in bulk, according to our system. Neither is desirable nor should be necessary. All other nations of the world have discredited this 3 to 5 year loan plan that we use in America, and it should have been discarded by us many years ago. The maximum time allowed for paying off loans for such purposes is 30 years in Finland, 33 years in Chile, 36½ years in New Zealand, 42 years in Australia, 50 years in Italy and Japan, 54½ years in Austria, 55½ years in Russia, 56½ years in Germany and Sweden, 57 years in Switzerland, 60 years in Denmark, 63 years in Hungary, 68½ years in Ireland, and 75 years in France.

It is stated on authority that there is a total of 25 billion dollars being utilized by the farmer in the above named countries on this long-time bond issue plan at an average of 3 to 4 per cent interest.

The necessity for development, particularly here in Missouri, immediately suggests the principle of the long time, or amortization plan.

If we discard the system of unlimited liability or collective credit we must, if we are to cover the whole subject, bring the State into its operation to a certain extent. All other nations have gone much farther in this respect than the plan I have submitted.

It must be borne in mind that the agricultural question is one to be considered from the standpoint of general welfare because food supplies concern every man, woman and child in the State.

I beg to call your attention to the following conditions existing: Twelve of the members of the Missouri Bankers' Commission live outside of St. Louis and Kansas City. The census of the counties from which these 12 members come shows a loss in population in the last ten years of 31,092, or 8.4%. Such splendid agricultural counties as some of these members come from show the following results:

Callaway...	6.1% loss in population
Saline	12.6% loss in population
Platte	11. % loss in population
Lewis	7.2% loss in population
Cooper	10. % loss in population
Atchison ..	17.6% loss in population

We might carry this thought a little farther and show that the whole state, outside of St. Louis and Kansas City, has lost 2% in population, according to the last census.

Are we not justified in asking ourselves if we can expect permanent and a full measure of prosperity to come to the banker, the merchant, the laboring man or, in fact, to any class of our population until a remedy has been found for the condition cited above? Better roads and better schools are permanent factors to be considered; but does not their development call for additional finances so their advantages may be duly exploited?

As to the financial soundness of the plan, I do not believe there can be any serious question. This can not be better illustrated than by the published statement of two life insurance companies in America. These two companies have actually invested at present in farm mortgages 155 million dollars, and they make the statement that they have never lost a nickel on a farm mortgage. And yet it is a fact that these same companies will charge a higher rate and a larger commission for making the loan than they will charge for bonds or for stocks or for city investments, showing plainly a discrimination against the farmer simply for the reason that the farmer has not the machinery to place these loans before the insurance companies in the proper way. And I was told by the Manager of one of the general life insurance companies in the last few days that his company would not bother with the individual farm loan, but that he was prepared now to say that he would invest three hundred thousand dollars in this State under the bond issue plan which I outlined to him.

Is it not a fact that if any security in the State is good it is farm lands? And what could be better than loans not exceeding 50% of our farm values? We certainly must expect to eat; and so long as that is the case bonds issued against such property are and should be as good as State bonds, and should sell at least on an equal basis.

The plan which I shall submit to you does not provide that a taxpayer shall be assessed a penny, nor can I conceive of how the State itself could lose. The reserve fund of ½% should protect the State, and it should protect the buyer of the bonds. The Secretary of Agriculture for Ireland told me that one billion dollars had been loaned to the Irish farmers by the English government at 2¾%, against which the English government had sold the bonds, and that this vast sum had been loaned to some 500 thousand different farmers, and that there was no record in his office of a default notwithstanding the fact that the plan had been working now close to four years. This billion dollars which has been pouring into the Irish agricultural districts, with a population not very much larger than the State of Missouri, shows to what extent the nations of the world realize the importance of developing agriculture. This vast sum has brought about a great revival in the whole of Ireland. Instead of a declining population in the rural districts, as we have in Missouri, the effect has been to increase it. It has stimulated a demand for electricity, fertilizer and building supplies which has brought about general prosperity to all classes of the Irish people.

It must be remembered that agricultural products are largely regulated by international competition. Missouri wheat, for instance, competes in Liverpool with wheat from Russia, France and Argentine. If the farmers in other nations are able to secure their money at about half what our American farmer has to pay, considering that our land will produce less and less because the virgin qualities are gradually being worn out, what will be the result without rebuilding?

Statistics show that in Missouri farms are mortgaged to the extent of 113 million dollars. These mortgages run from one to five years. An average, perhaps, would be three years. Hence about 40 million dollars worth mature annually. If a renewal commission of 2% is charged on this sum it would mean 800 thousand dollars per annum. If there is an excess of 2% in the rate charged which could be saved by the installation of a farm loan bank it would mean a total money waste to the farmer directly of 800 thousand dollars in commissions and about 2½ million dollars interest, or a total of some 3¼ millions. This means not only an economic waste to the farmer, but also a tax on the balance of the population. Upon reflection, then, is it any wonder that retail prices of food are 70.9% higher for the ten year period? Twelve of the fifteen articles of food have advanced more than 50%. For instance, bacon has advanced 133.3%; round steak 107%; fowls 74.2%. With the decline in the production of agricultural products, and a large increase in our total population, is it strange that the cost of living has increased so enormously? We may also ask the question that if our cities continue to grow, and our rural population to decrease in proportion, how long will it be before we cease to export food products at all, beside going hungry at home?

Peter Radford's Advice to the Unemployed

"If any of the nation's industries have surplus employes we can use them on the farm. We have no regular schedule of wages, but we pay good farm hands on an average of $1.50 per day of thirteen hours when they board themselves; work usually runs about nine months of the year and the three months dead time, they can do the chores for their board. If they prefer to farm on their own account, there are more than 14,000,000,000 acres of idle land on the earth's surface awaiting the magic touch of the plow. The compensation is easily obtainable from Federal Agricultural Department statistics. The total average annual sales of a farm in the continental United States amount to $516, the cost of operation is $340, leaving the farmer $176 per annum to live on and educate his family.

"There is no occasion for the legislatures making a position for surplus employes of industry. Let them come 'back to the soil' and share with us the prosperity of the farm.

PRACTICAL FARM PAPERS—No. 4.

A little recent experience not altogether on farm lines is worth recording while it is fresh in mind.

Wife discovered that the house was full of mice, the number being estimated at from 25 to 100. I invested in mouse traps, six for a dime, and in two nights we caught six mice in the sitting room with the result that we have not heard one since. Then the traps were transferred to the store house and cellar, again catching six in two nights, and as the traps are still there, unsprung, we conclude that we have cleaned out the mice, at least for a time. We will put the traps in the seed corn crib now, for while it is supposed to be mouse-proof, one or two are to be caught there every season.

A neighbor had a hen caught by a hawk and his little boy set two steel traps by the caracss, catching a bluetail chicken hawk a day for three days.

Half a dozen of these little six-for-a-dime mouse traps, well watched, will catch more mice in a winter than the same number of cats will, and a steel trap or two set near a dead hen or rabbit, may be the means of saving several dozen young chickens next spring.

In my experience, February is the month in which rabbits do the greatest damage to young orchard trees, and if yours are not wrapped, see to it soon. I have found that an old newspaper does very well wrapped four or five times around the trunk and tied once. Of course there are better tree protectors than old papers, but we always have the papers and we do not always have the other things. Here we often use tobacco stalks, thus protecting the tree, fertilizing it, and killing the louse that causes root galls all at the same time.

The first carload of corn for the season came to our county seat January 15, and sold at 82½ cents per bushel. On the same day buyers were offering $6.65 per cwt. for hogs, or within 45 cents per cwt. of the Cincinnati market top. We have a big crib of corn and only a few hogs, but can buy thirty head of sixty pound shotes at 7 cents per pound and are not certain as to whether we will take them. If corn goes to a dollar, or over, and if hogs in June do not go to near a dime, we would just about lose the purchase price of those shotes, and while I know neither more nor less than any other man does about the future of the hog market, I feel rather shaky about seeing ten cent hogs in May and June.

Owing to lack of organization among farmers, and due to the perfect organization of the packers, the future is sealed to us, while the Big 4 could tell us today the average price they will pay for hogs every month in the year 1915.

With 22 million pounds less white burley tobacco in 1914 than in 1913, prices today are four to five cents per pound less than they were on the same date last year. Of course wheat is high in price, but very few farmers have any wheat to sell, as for the past few years the prices paid at threshing time have been nearly as good, all things considered, as those paid later.

A queer condition was noted in the egg market here January 14-20. While eggs in Eastern market, New York, Boston, Baltimore, were selling at 46 and 48 cents per dozen, and it only costs 3 cents per dozen to ship there from Cincinnati, the produce exchange of the latter named city put the price down from 40 cents per dozen to 31 cents. Verily the farmer has little to say about what price he is to get for his produce. C. D. Lyon.

There should be no idle acres this year. The war in Europe is bound to make good prices for all the crops we can produce.

Light Weight Cushman Engines
For All Farm Work

This Light Weight Cushman Truck is so handy for all power work. So light a boy can pull it around from job to job, yet it easily handles all work up to 4 or 4½ H. P.

Engine weighs only 190 lbs.

Runs at any speed desired, speed changed while running. Pump circulation to water tank prevents overheating, even on all-day run. All Cushman Engines are

Throttle Governed—Steady and Quiet

No jerky, explosive hit-and-miss running. They are the most useful engines for farm work, as they do everything the big fellows do and so many jobs big engines cannot do. May be attached to binders and other machines as power drive. Equipped with Schebler Carburetor and Friction Clutch Pulley. Not a cheap engine, but cheap in the long run. Sizes 4 to 20 H. P.

Before buying any engine, better investigate light weight engines. Ask for free Engine Book.

A 365-DAY ROAD CLUB

We have your letter asking what the 365-Day Road Club is—what it has accomplished and can it be adapted to other counties?

We will try to answer your questions in as brief form as possible.

Originally the 365-Day Road Club was a combination of one hundred and twenty men and seven thousand two hundred dollars (each member paying five dollars a month, $60 a year) for the purpose of aiding in the building of roads leading into Carthage, Missouri, that could be used with safety, profit and comfort 365 days in the year. The second year it was a combination of one hundred forty men and eight thousand four hundred dollars. During the third year of its existence and the fourth year, just closing, the palpable and hidden forces brought into action on road building operations had developed enough power to run on momentum so far as membership fees were concerned. It was not necessary to collect any dues from members in 1913 and 1914. A clear understanding of how this was accomplished would require explanation too lengthy for this article and we will therefore have to be content with the statement that during the last two years when the membership of the club were paying no dues more miles of road were constructed and maintained and greater constructive forces were brought to bear on the subject of road building than in the two years when membership fees were being paid. From this experience we have deduced one definite conclusion and that is, that while the money subscribed during the first two years was a very necessary ingredient in the combination of forces employed it was neither the largest or most valuable element producing the results. A suggestion of what these forces were may be gained by a study of one of the 365-Day Road Club's cardinal doctrines: "Put the people in your problem."

So strongly is this idea growing upon us that we are thinking of reorganizing the Club for 1915 each member to pay 365 dimes in money and 365 minutes in time as his contribution to the work for the next year. Our experience teaches that we can get as good results out of this combination as we could get out of four times the money minus the minutes.

Prior to the formation of our club it has been the custom here, as in many other localities, for the road men to build a piece of road and treat it like a monument in the cemetery, returning to it only in hours of grief. The name of the 365-Day Road Club was selected with malice aforethought so that every time it was seen or used or remembered it would silently teach the doctrine that eternal vigilance is the price demanded for roads as well as the price demanded for liberty. To paraphrase an old saying, "Go to the ant, thou road man, learn of her ways and be wise." Disturb an ant hill and see how quickly repairs will be commenced.

Another cardinal principle of the Club is "Hold what we have, get what we can." Putting this in practice fifty per cent of available road funds are put into "Maintenance account" and the other fifty per cent is allotted to "New Construction."

When the club was formed four years ago the roads in this locality consisted of disjointed sections of good roads with bad places of greater or less extent between the good parts. In bad weather these good parts stuck up like a blue sky bridge in a flood—of little or no use till the bad places got fordable. We now have a system of good gravel roads in Jasper County surrounding Carthage and connecting the farming districts of the rest of the county with the mining districts in the west part over which motor cars or heavily loaded wagons can run 365 days of the year. One of these motor cars could run continuously for three days (Union Time) at a rate of 25 miles an hour without retracing its track or getting off the gravel of our road system.

Much complaint is heard throughout the land of high taxes, and politicians gain elections by promising relief and devise systems of indirect taxation to fool the people into the belief that they have made good the promise. Notwithstanding this the Road Club has put into successful operation a system of the most direct taxation. Neighborhoods call meetings, assess themselves, guarantee the levy and do their own collecting.

The club purchased and now owns two large traction engines which are kept at work in construction and maintenance work. The purchase, ownership and use of these engines proved a great factor in the early exploits of the club and solved some problems with ease that would otherwise have been difficult. And now as they make their periodical trips from one part of our road system to another they serve the same purpose for our work, as do the signs one sees on bank windows serve the purpose of the banker. The signs one sees on bank windows read something like this: "Capital $100,000." "Surplus $100,000." Stockholders Liability $100,000." "U. S. Repository." "Member Federal Bank Reserve Bank."

The 365-Day Road Club preaches good business principles and tries to practice them. The wise business man holds and increases his trade by giving bargains. The club has introduced such economies in road building that every one who has contributed to its support feels that he got a bargain for his money and is encouraged to go to the same place for more goods of that class and tell his friends about it. The most substantial proof the club has received that it has practiced this precept is the fact that there are already on file donations sufficient to secure the construction of eleven and one-half miles of road as soon as spring opens. A line of people in front of a bank before opening time might mean that no great confidence was placed in the signs on the windows but a line of people in front of a merchant's door before opening time would be construed by the passer-by as the sign of bargains to be had within. So when the farmers will line up months before opening time with contributions to build roads, is it not reasonable to suppose that bargains are to be had within?

A lazy dollar is of as little use to a bank as a lazy man is on a farm. The club has made every dollar in its treasury do the work of four and the lazy man has to speed up to get a look at the dollar as it goes past.

In a broad sense the 365-Day Road Club is a community in action, the dividends of the transaction in the way of benefits going back to the whole community and not to the few.

Can the 365-Day Club Idea be adapted to other communities? Yes, wherever there are live people. It could not be worked successfully in a cemetery. Live people is the main ingredient. Wherever there is a live community the club idea will produce just as good roads as they deserve. It will not make boulevards out of bogs but it will make 365-Day roads wherever there are people to use the roads enough to keep the grass and weeds from growing between the wheel tracks. Neither is it any great metaphysical mystery. Any man of ordinary intelligence who will give it one hour's attention and study can possess its secret. It is as simple as a gas motor and just as easily understood and reliable. In its practical working in our locality the banker has seen it turn liabilities into resources and the farmer has seen it turn barren into fertile fields, and the donor has seen his donations turned into a fund of cash sufficient to buy a horse and wagon.

During the recent flip-flops in wheat prices, our people did not have to consider road conditions in marketing their wheat. When the telephone brought the news of a satisfactory price the road was ready, 365 days in the year.

J. D. Clarkson,
President 365-Day Road Club.

Note.—If more of our charitable societies were organized and working along this line—every dime of contribution to be accompanied by a minute of kindly and helpful thought, some of them could soon be running on momentum and willing workers would be receiving living wages instead of wasting time hunting soup houses.

BOYS' AND GIRLS' CLUBS

The College of Agriculture has been organizing and promoting Boys' and Girls' Clubs since March, 1914. At first it began with only two lines of work, which were corn clubs for boys and tomato clubs for girls. During the spring and summer 96 clubs were organized with a membership of 1197.

With the opening of the fall term of school, three other lines of work were projected; these were stock judging clubs, sewing clubs and poultry clubs. The total number of clubs organized from March to January were 339 with a membership of 3071.

In order to encourage the work the State Corn Growers' Association offered a nice line of premiums to the corn clubs and several business firms offered premiums to the tomato clubs. The firms encouraging this work were Mermod-Jaccard & Co., St. Louis, the State Bankers' Association, The St. Louis Seed Co., The Simmons Hardware Co., and the Shapleigh Hardware Co., the last two firms also of St. Louis.

The sweepstake prize, a silver cup, was awarded Mary Turnbow, Pittsville, Mo. The prize for the best jar of tomatoes grown and canned by a member of a club, was awarded to Nellie Shelton, Holden, Mo. This was also a silver cup. A set of Diamond Edge knives and forks was awarded Golda Moberly, Barnard, Mo. A camera was awarded to Sophia Mellies, Owensville, Mo., and a set of ladies' pruning shears to Delta Deal, Holden, Mo.

In order to encourage local interest in this new educational movement, several merchants of Columbia offered prizes, some to members of the corn clubs and others to members of tomato clubs. About thirty-five boys and girls began this work but only one came up to all of the requirements of the organization. These requirements were that the corn or tomatoes must be grown by the members, written reports must be made of the work, the products—either corn or tomatoes—must be exhibited and a story of two hundred words telling briefly about the activity carried on must be presented at the close.

The
Autographic Kodak

Date and title your negatives permanently, when you make the exposures.

EVERY negative that is worth making is worth a date and a title. In business farming, with every picture that you take of stock and crops, and machinery and buildings, you can write valuable data permanently on the negative. The places you visit—interesting dates and facts about the children, their age at the time the pictures were made—the autographs of friends you photograph—these notations add to the value of every picture you make.

Just release a stop and a door opens in the back of the Kodak; write whatever notation you want; expose from 1 to 5 seconds; close the door and you are ready for the next exposure. On the margins between the negatives will appear a permanent photographic reproduction of the notation you made. It is not a part of the Autographic plan to reproduce this in the print but that it simply be preserved as a permanent record on the negative. It is obvious, however, that such records can be shown on the prints themselves whenever desired.

The greatest photographic advance in twenty years.

Autographic Kodaks now ready in a score of styles and sizes from $9.00 up.

MISSOURI HOME-MAKERS' CONFERENCE

Edited by Miss Alice Kinney, New Franklin, Mo.

[The Missouri Farmer has a great deal to say in each issue about cattle and corn, hogs and alfalfa and other like subjects and while we aim to continue to give the usual high-class information on these economic subjects for the benefit of our men, we are very glad to announce the arrangement with the Missouri Home Makers' Conference whereby that association becomes sponsor for a page devoted to the interests of women. The department will be edited by Miss Alice Kinney of New Franklin, past president of the association and a woman in full sympathy with the work looking to the lightening of the work of farm women and for the improvement of the social life of the country. We trust our farm women readers will aid Miss Kinney in making this department a useful and interesting feature of the paper.—The Editor.]

Officers: President, Mrs. Harry Sneed, Sedalia; 1st vice-pres., Miss Louise Stanley, Columbia; 2d vice-pres., Mrs. Horace Windsor, Boonville; cor. sec., Miss Bab Bell, Columbia; rec. sec., Mrs. D. H. Doane, Columbia; executive sec., Miss May McDonald, Columbia; treas., Mrs. Ivan W. Phillips, Kingsville.

Advisory Board: Mrs. N. H. Gentry, Sedalia; Mrs. Marie T. Harvey, Kirksville; Mrs. F. B. Mumford, Columbia; Mrs. R. E. Shryock, Kansas City; Mrs. J. E. Roberts, Maysville.

The Missouri Homemakers' Association wish to express their sincere appreciation to The Missouri Farmer for the courtesy extended them in the proffered use of this department.

Glady do they avail themselves of this open doorway through which they hope to come into closer touch with each other, as well as other rural and home economic clubs over the state.

The object of this organization is that women by lending their assistance will gradually help to weld the numberless incoherent parts of awakening interest among the hundreds of isolated women into a cohesive force that will bring results for all.

This cannot be brought about by one person or one set of women, for the success of any organization depends upon co-operative and individual effort; through the columns of this department we shall continue to urge women to meet this responsibility with greater interest thus the co-operative spirit will grow from which all will draw strength.

The Missouri Homemakers' Association is an organization of both farm and town women, who meet annually at Columbia during Farmers' Week, and while the men discuss stock, crops, machinery and better markets, the women are discussing plans whereby they may not only solve their own home problems but also ways by which they can help to enrich the community in which they live.

Every woman is eligible to membership in this association and through these columns we cordially invite correspondence and especially do we solicit reports of clubs, regardless of size. What you are doing for your home and neighbors is of vital interest to others, and if you will let us have your experiences they will be gladly appreciated.

Many of the Movable Schools of Home Economics, started last summer, have formed permanent clubs, and are holding regular meetings. In one Cooper County club the members became such enthusiastic workers that they sent two girls to Columbia during Farmers' Week for the Short Course in Home Economics.

Report of the Conference held by the Missouri Homemakers will be given in the next issue of The Missouri Farmer, also reports from some of the Home Economics circles that were started last year.

Mr. and Mrs. J. Ed Hall of Lamont, Mo., are offering through the Missouri Homemakers' Conference a $10 trophy to the young woman in the state who will most successfully can six jars of different vegetables in pint jars, these cans to be exhibited and scored at the January 1916 Conference. This is the most liberal offer for culinary product that we have ever seen and fortunate is the young woman who wins it. We shall be glad to hear from all who wish to enter the contest.

The growing demand for certain lines of development has led this organization to create departments with women as chairmen who from trained experience have become experts in their special lines of work.

The outlook of the Poultry Department is most encouraging, for where is the woman who is not interested in poultry either for production or for her family table.

Do you know that—

Fresh meats, dusted with Borax, will keep fresh much longer. Rub the Borax in as you would pepper and salt. Wash the meat before cooking.

Borax, added to the water in which your washing is done, saves lots of valuable time. It makes washing a simple and easy undertaking, without any attendant harmful results. Add three heaping tablespoonfuls or more to every tub of water.

Bacon curers use Borax in place of salt for curing.

The hands will be kept soft and white, and free from all chap, redness and roughness if Borax is used in washing them.

If you want your clothes a snow white—not yellow-white, or gray-white, but real white—use Borax in the cleansing water. It will also restore to a snowy white after two or three washings, linens that have acquired an old, yellowish cast through frequent washings with ordinary cleansers.

WOMAN'S APRON

To woman's apron—Glory be—
What tribute should be paid to thee—;
Methinks Milady should have its charms
Emblazoned upon her coat-of-arms;
In its useful mission, it is unfurled
By every nation of the world.

For many purposes 'tis used
And sometimes very much abused;
But on the farm it reigns supreme
When worn by an up-to-date Kitchen Queen;
With a flounce at hem and pockets on sides
It's an ever present help in the Cook Spoon Glide.

As she balances rations for the inner man
With a "Grand Finale Symphonie Dish-pan,"
While Babykin laughs as he fondly clings
For his first support to those apron strings,
Its importance in housework plays quite a role,
From nails to hen's eggs it must always hold.

The nurse in her apron of spotless white
Administers to sick by day and by night,
The sight of her apron, oft brings relief
To suffering humanity, is common belief;
At home or abroad, where e'er she may be,
Her apron and cap are as neat as can be.

'Tis plain then to see the essential part
The apron holds dear to the feminine heart;
Creations of ribbon and lace, too, abound,
Embroidery and dimity, with ruffles all 'round;
For the afternoon dress or the five o'clock tea
The "smart" little apron is all it should be.

Mere Man dons an apron with awkward grace,
As he tucks it under his arms or his face;
His overall, however, is a good substitute,
With pockets galore, fore and aft, just to suit.
In the feminine world then, the apron will reign
And with home economics will it always share fame.

—Mrs. Scott Cunningham, Palmyra, Mo.
Written by request for the Missouri Home Makers' Conference.

A WOMAN FARM ADVISER

That the farm women are awakening to the needs of better social conditions, more attratcive homes and better educational advantages for the rural communities, is being clearly demonstrated by the Pettis County Homemakers' Club of Missouri. This is a farm woman's organization, organized by the State Board of Agriculture. It was the first club of its kind in the United States and no plans had been formulated for the work so they were left absolutely dependent upon their own resources.

Their first thought was for the rural schools, and hoping to bring the home and school in closer touch, a woman was appointed in every district represented in the club to be responsible for the visiting of the schools every two weeks by the parents and patrons. A report was made at the monthly meetings of the club and the plan met the desired end. The children were delighted,the teachers encouraged and the parents became more interested in some districts. Even the "School Board" visited the school and many long needed repairs were made and conveniences provided.

The next step was to create a sentiment for the teaching of wood-work for the boys and sewing and cooking for the girls. This was brought about through a sewing and bread-baking contest in which Homemakers' children only were allowed to enter, but almost every township in the county was represented and much interest was manifested. Both fathers and mothers came to see the work and all were enthusiastic over it. By the close of the school term there were ten schools in the county where sewing and woodwork were taught. Then the idea of a county Domestic Science teacher or Farm Woman Adviser was conceived. They were led to believe that if they raised $500 the state and government would give them a like sum as they do the farm adviser, but $500 looked like a vast sum to farm women who are dependent upon their market money not only for their own spending money but for the table supplies and most of the children's clothing.

After much thought and careful study of the project the plan of apportioning it among the school districts was decided upon and by 34 districts out of 96 in the county giving $15 each the amount could be raised. This plan was put before the club and it unnanimously voted to raise the money and as the districts were called invariably two or three women rose and vouched for the required amount. It was a great meeting that day with about 100 women in attendance all enthusiastic and happy and ready to do all they could for the success of the project.

But great was their disappointment when upon reporting the result of the meeting to the State and Government departments they were told there were no available funds whereby they could help them.

But these farm women were in earnest and were determined to carry out their plans so another meeting was called and conditions explained and every woman present voted to go on with the work and some way the money would come. While the women in the different districts were earning their money by giving socials and teas where women who had lived neighbors for years met for the first time, the president and corresponding secretary of the club undertook the task of raising another $500. They wrote to every agricultural department from Secre-

LIGHT, COOK, IRON, WITH GAS

Every housewife on the farm or in the small town can now use gas for every purpose for which the women of large cities use it. Think of this! You can now have a convenient gas range, gas iron and gas lights exactly like your friends in the cities. Few city people use coal or wood ranges today. They're too much trouble—and too hot in summer! A gas range takes little room, is clean, cool—and the hottest or gentlest heat is always ready. Gas lights are a hundred times as handy as lamps. No filling. No cleaning. All this convenience is made possible for you by the new

AERO-GAS MACHINE

which makes gas for 60 cents a thousand cubic feet—20 cents less per thousand than gas costs in St. Louis. Installed in the cellar, the Aero-Gas machine takes gasoline from a tank buried in the yard and converts it into gas automatically. There's no flame anywhere around the machine to cause danger. The gas is distributed throughout the house in ordinary gas pipes. Requires no generating. The only attention necessary is to fill tank in yard and occasionally wind up weight that runs machine. Both are easy.

Free! Every housewife who wants a cool kitchen in summer and all other conveniences that gas affords—and every man who has the comfort and convenience of his wife and family at heart, should write today for our Free Booklet that gives full details and prices. When writing, give name of party who does gas-fitting, plumbing, etc., in your locality.

St. Louis Aero-Gas Machine Co.
517-519 North 2nd St., St. Louis, Mo.

SUMMER PROFITS IN WINTER EGGS.

Hens can't lay eggs unless you feed them on something eggs are made of.

In summer they find plenty of albumen in animal food, but in winter they can't get it unless you **feed it to them!**

This winter eggs will bring a premium price. There has never been a better time to start an egg farm.

Green bone shaved into fine, splinterless, easily digestible particles is the best wintertime food for hens. It takes the place of the outdoor food they pick up in summer.

Stearns

LINE OF GREEN BONE CUTTERS

are the best machines for preparing this valuable food. They cut the hardest bone and gristle or the softest meat fine enough for a day-old chick—no splinters—no lumps to stick in the fowl's crop.

For sale by all Dealers—or sold direct if your dealer cannot supply you.

Our FREE BOOK—"How to Make Poultry Pay"—is written by a specialist on egg production.

E. C. STEARNS & CO.
104 Oneida St. Syracuse, N. Y.

tary Houston on down and the reply always came back "There are no appropriations for farm women." They tried to interest wealthy and philanthropic people in the cause but as it probably was the first time that farm women ever asked for anything they could not convince anyone of the importance of the work. So these two women went to work at home and by getting a little here and there they raised another $500, thus making it possible to start the woman in the work.

They count themselves fortunate in having a Pettis County girl, Miss Mildred Henton, who is peculiarly fitted for the work and who has accepted the position. She began in her new field of labor November 16, and what the farm adviser is doing for the men, boys and farms she will do for the women, girls and schools. The one standing for better crops and more money, the other for better homes and better citizenship.

Pettis County Correspondent.

OBSERVATION AND INVESTIGATION

Reveals the facts that a great many farmers look upon the hen with indifference or consider her and all her kind as a nuisance, to be tolerated only as a means of supplying the women folks with a few dimes on Sunday occasions, or when eggs are exchanged at the store for groceries or small wares dear to the feminine heart. The good wife with her never-ending tasks is supposed to take charge of these birds especially in the spring time, and rear a supply of chickens for the replenishing of the flock for the Sunday dinner and to buy more dry goods, groceries and chewing tobacco. No account is kept of the number of eggs produced or the value of market poultry either consumed at home or sold on the market. Although these products are much appreciated as table necessities, yet their cash value is not reckoned. That the hens produce much more than they cost and that they may be considered as an adjunct to help swell the general revenue of the farm, the same as pigs or cows or any other line of farm economy is foreign to the thought of the average farmer.

The opportunity presents itself to you right now. The demand for poultry and poultry products will never be greater than this season. Foreign conditions are bound to stimulate demand that we cannot meet, and high prices are scheduled for 1915. Give the hen the attention she deserves and reap the benefit.

The Necessity of Clean Hens' Nests.

When nests are allowed to become filthy and dirty they are distributors of disease and vermin, and for this reason the straw should be removed often. The nesting box should be sprayed and fresh straw supplied. Then again if they do not look inviting the hen will look for other quarters and perhaps hide her nest where it cannot be found. If you use the dropping board system in your poultry house, fasten the nests to the underside of it, allowing the hens to enter the nests from the rear, having a hinged door in front for use in gathering eggs and cleaning nest. This system makes it very convenient for the attendant and satisfactory to the hen.

Dust Baths

Keep close to nature if you succeed with poultry. The natural way for fowls to rid themselves of vermin is to roll and scratch in the dust. All poultry that are confined should be supplied with some kind of a dust bath. A frame should be made of suitable size and placed where the sun will reach it. Ashes make a good dust, but dry road dust is better. Some breeders of white fowls use flour with powdered napthaline, others add sulphur or powdered tobacco stems to the dust. Any of these are good and worth trying. Remember a lousy hen will never lay enough eggs to pay for her feed, and at the present price of eggs it is well to look for the health and happiness of your hens.

E. L. Andrews.
Maryville, Mo.

FIRELESS BROODERS AND TEMPERATURES FOR BROODING

Cold, or fireless, brooders are successfully used in a small way by many people, and can be either purchased or built, according to the U. S. Department of Agriculture's specialist. As their construction is very simple, many people prefer to build rather than to buy them. The body heat of the chickens is the source of warmth in this system, which requires that several chickens be placed in a small receptacle to generate and retain the heat. Small fireless hovers with adjustable quilts or covers are used in both indoor and outdoor brooders and in colony houses. A box 18 inches square and 8 inches deep is recommended by the U. S. Department of Agriculture as a good hover of this type.

The number and position of the quilts used over the chickens in this box are regulated according to the weather and the number of the chickens in the brooder. In very cold weather the quilts should sag so as to rest on the backs of the newly hatched chickens and there should be little or no empty space in the hover, while in warmer weather or with older chickens the quilts or covers are raised or part of them removed. From 12 to 40 chicks are usually placed in a fireless brooder, 25 being the average number, while small lots do better than larger ones under this method. The litter in these brooders must be changed frequently, and the chickens must be watched carefully and closely to see that they are comfortable and do not sweat. Fireless brooders may be used in connection with heated brooders, using the latter for 7 to 10 days and reducing the heat, which should be governed by the season of the year and outdoor temperatures, before transferring the chickens to the fireless brooder. When first placed in the fireless brooders the chickens may have to be put under the hovers frequently, until they learn where to get warm. Good results are also obtained with these brooders when used in a heated room.

Correct Temperatures for Brooding

The best temperature at which to keep a brooder or hover depends upon the position of the thermometer, the style of the hover, the age of the chickens, and the weather conditions. Aim to keep the chickens comfortable. As the operator learns by the actions of the chickens the amount of heat they require, he can discard the thermometer if he desires. When too cold they will crowd together and try to get nearer the heat. If it is found in the morning that the droppings are well scattered under the hover it is an indication that the chickens have had enough heat. If the chickens are comfortable at night they will be spread out under the hover with the heads of some protruding from under the hover cloth. Too much heat will cause them to pant and gasp and sit around with their mouths open.

It is impossible to state for each case at what temperature the brooders should be kept to raise young chickens; however, it will run from 90 degrees up to 100 degrees in some cases. as some broods of chickens seem to require more heat than others, an average being 93 degrees to 95 degrees for the first week or 10 days, when the temperature is gradually reduced to 85 degrees for the following 10 days, and then lowered to 70 degrees or 75 degrees for as long as the chickens need heat. This depends somewhat on the season of the year and the number of the chickens, as it can be readily seen that the heat generated by 50 chickens would raise the temperature under the hover to a higher degree than the heat given off by a lesser number, consequently the amount of heat furnished by the lamp or stove will have to be regulated accordingly. As the chickens grow larger and need less heat, the lamps may be used only at night, and later only on cold nights. The heat is usually cut off at the end of 4 or 5 weeks in March or April in the vicinity of Washington, D. C., while winter chickens have heat for 8 or 10 weeks, or until they are well feathered. Care should be taken to prevent chilling or overheating the chickens, which weakens them and may result in bowel trouble.

Chickens need a cool place for scratching and exercising in addition to heat. Indoor brooders and hovers can be used successfully in unheated brooder houses except during the coldest weather in most sections of the country. Outdoor brooders usually

The SURE HATCH INCUBATOR

The Sure Money Maker For Beginner or Expert

Poultry on your place is a constant source of delight and profit—turns kitchen wastes and farm wastes into ready money, every day in the year. Chickens will pick up their living around a place where they have some range and this is all clear gain.

The Sure Hatch Incubator will increase your income many times over. One Sure Hatch will get you more chicks than 20 setting hens—in less time, because it is always ready; with less bother, because it requires less attention—will give you cleaner, healthier, stronger chicks, because the Sure Hatch does not harbor vermin, to start diseases that are hard on the little fellows.

Frank Hammond President

The Wife OR THE Children Can Manage the Sure Hatch

with pleasure and no trouble at all. Very little time and effort required. They can make substantial deposits in the bank, in Spring, Fall and Winter when poultry prices are highest.

Don't waste your money and time with machines that hatch chicks which will not live. No matter how good the eggs are that you put into a poorly-built machine, the chicks will be puny and will die, because the correct hatching conditions cannot be maintained—without variation throughout the hatching period.

That's Where the High-Class Construction of The Sure Hatch Protects You

The material used in its construction, the careful way in which it is put together, its hot-water heating system and absolutely accurate, automatic regulation of heat, moisture and ventilation, make it the greatest hatching machine on the market—dependable at all times—an unfailing success—**it produces a strong, healthy chick from every hatchable egg.**

Early chicks bring the most money. Let us send you a Sure Hatch freight paid under our strong 10 year guarantee and on 60 days trial. You are safe in doing this; we are responsible, our dealings are always fair, as the thousands of Sure Hatch users tell you.

Of course, we have Brooders, but we tell you about them in our big, free catalog.

Our Uncle Sam Poultry Book is sent free with every Sure Hatch. No other book contains so great a fund of practical information telling you how to succeed at the poultry business. **Our illustrated catalog free.** Shows how Sure Hatch Incubators and Brooders are built, and why they are the ones you should have.

have a cool compartment for exercising, where the chickens are fed in cold, stormy weather. If winter chickens are being raised, it is advisable to heat the brooder house to a temperature of 60 degrees to 70 degrees, regardless of the temperature of the hover, which often requires placing brooder pipes around the outside walls of the brooder house. The need of this heat depends entirely upon the brooding system and the weather conditions; but it is absolutely necessary that the heat be kept at the desired temperature under the hover. Brooders and hovers should have from one-half to two inches of sand, dry dirt, cut clover or chaff spread over the floor and in the brooder-house pen. The hovers should be cleaned frequently, as cleanliness is very essential in raising chickens successfully.

When chickens are first put into the brooder they should be confined under or around the hover by placing a board or wire frame a few inches outside (this would not apply to the small outdoor colony brooders). The fence or guard should be moved gradually farther away from the hover and discarded entirely when the chickens are 3 or 4 days old or when they have learned to return to the source of heat. Young chickens should be closely watched to see that they do not huddle together or get chilled. They should be allowed to run on the ground whenever the weather is favorable, as they do much better than when kept continuously on cement or board floors. Weak chickens should usually be killed as soon as noticed, as they rarely make good stock, while they may become carriers of disease. Brooders should be disinfected at least once a year, and more frequently if the chickens brooded in them have had any disease.

SUCCESS OR FAILURE IN 1915?

The approach of spring is a happy season for the poultryman as well as the spring poet, but, unfortunately, we have too many poultrymen who confine their enthusiasm largely to these months as do many of the sentimental writers of springtime literature. We cannot impress upon you too strongly that the poultry work is a year-round business and cannot be neglected at any season but there are more points to be looked after at the approach of the breeding season than at any other time. You are then laying the foundation, and upon the intelligence that you use at this time largely depends your future success. Look well to your matings for 1915.

You should have by this time fully made up your mind as to the breeding pens. This work cannot be done in a day and you should have records kept throughout the year that will enable you to do away with guess work and mate with accuracy. Now it is true that everybody cannot use the trap nest, but even the man with one pen of fowls can toe mark and leg band his chickens and have ways of identifying his flock so that he may do the work of mating with intelligence.

We wish especially to urge you to study the Standard and the requirements for your variety. The new Standard is now ready and your birds should be mated with that in view, as it will be the judge's guide at the poultry shows next summer and fall. Get the Standard at once and take another look at your pens to see if you can make any further improvement in your 1915 matings. We feel confident it will be the best Standard ever issued. We hope it will prove to be, at least.

Don't overlook vigor or vitality in every bird in your pens. That should always be the first requirement, for without that your birds cannot retain their good shape, their brilliancy of plumage, or be good producers from any point of view. Breed from males and females that have been good producers or that have been bred from good producers. Don't forget that the egg basket is where most of the profit is, and that eggs represent more than half the income from this great industry.

In some sections of the country, February and March are excellent months to raise poultry, and it is possible to produce birds that will lay eggs during the early months of fall when eggs are the highest, birds that will be in prime condition for the early show rooms, and that will be mature enough for breeders the following season. The hatch may not be quite so good, but if you will provide comfortable quarters the chicks will be freer from disease and vermin than when hatched later in the season. Then, too, those birds that you wish to cull out bring a good price on the market as broilers. In fact, reaching the market with early broilers is one method by which paying returns are brought to the specialist who raises fowls for the market.

For the above reasons and for others which might be stated, we think that every farmer and every poultry raiser should have at least one good incubator holding 120 eggs or over. It is the practice of too many people to set the first hens which go broody in the spring and these are usually the very hens which they should breed from and should be kept laying. These hens are the ones which had the ability to lay in winter when eggs were highest. Start the season of 1915 right and you will find pleasure and profit later in the poultry business as a result of your carefulness and common sense used at this time.

T. E. Quisenberry,
Mountain Grove, Mo.

TO PREVENT ROUP

Roup, in its common form, is an exaggerated cold which is produced through exposure in damp, draughty, or poorly ventilated buildings and filthy surroundings. In the common forms of roup there is an abundant discharge of mucous from the nasal and throat membranes. This discharge has a very offensive odor. It also creates a rattling sound in the throat when the fowl breathes. In the later stages of the disease the mucous discharge accumulates in the tissues of the eye and face and hardens in large, cheesy lumps. The eyes and skin of the face are bulged out by these lumps. Occasionally the accumulation of this cheesy matter in the tissues of the eye forces the eye out of its socket. When this advanced stage is reached the irritation and fever become so great that the fowl soon dies from weakness and exhaustion.

In the treatment of this disease it is first necessary to improve the house conditions which are responsible for the outbreak. Every infected individual should be removed to special quarters so as to prevent the communication of the disease to other fowls in the pen. The following simple remedies can be used: Permanganate of potash, one ounce dissolved in three pints of water. Use one pint of this solution in three quarts of drinking water. It can be used as a dip for individual treatment. To do this, grasp the legs and wings of the fowl in one hand and the back of its head in the other; thrust the bill into the solution and hold it there until the fowl draws in a slight amount of the solution in striving to breathe. It can also be used, several times a day, as a spray and with an atomizer forced into the nose and the upper part of the mouth. It serves to cut the mucous discharge and to cleanse and relieve the membranes. It has also proven greatly beneficial to paint or spray the perches with a thick coal-tar product, such as crude carbolic acid, cresol, or carbolineum. The fumes rising from these products will be breathed by the fowls while roosting and will loosen the mucous discharge and clean out the nasal passages.

All forms of roup are not considered communicable by some writers, but nearly all agree that diphtheretic or cankerous roup is communicable. This disease is recognized by the cankers or sores which form in the mouth and at the edges of the beak. It is difficult to protect a flock which has been exposed to this disease. The use of disinfectants and carbolic acid or cresol should be liberal. All infected fowls should be destroyed as soon as they are noticed.

BUCKSHOT BY THE PROFESSOR

If I knew whether your wife and children respect and love you I would know what kind of a man you are.

Every farmer's wife should have a good incubator—for it will pay for itself several times over the first season.

A wise man once wisely said that it is easy to win in the World because so few men are trying to do it—that there is so little competition. Think it over.

There is no more pitiable sight in the World than the man who has lost his grip—who is aimlessly floating with the current like a worthless piece of driftwood.

The man who doesn't stand for something—who isn't trying to better his condition and that of those dependent upon him—such a man is of little more consequence to society than an old flea bitten mule.

If you haven't renewed your subscription to The Missouri Farmer yet, do it today. There isn't a farmer in Missouri who can't afford to pay 33 1-3 cents a year for three years for a paper like this one.

Here is a thought for my boy friends: I have met quite a few big men in my time—men who are at the head of large enterprises and who are doing things—but I never saw a man of this type smoking cigarettes.

Now is a good time to build up a big wood pile for next summer—and while you are at it, put it close to the kitchen so the women folks won't have to pack it a quarter of a mile.

Put in these long winter evenings studying how to make more money out of next year's crops. Everything the farmer raises is going to bring big prices for the next year or two—but it won't do you any good unless you've got something to sell.

The only chance a lot of boys have to amount to anything in the World is to be different from their fathers. Are you setting a good example for your boy to be industrious, clean of habit and instilling within him a desire to win and be somebody?

A man can't turn around in this world without bumping into good ideas—ideas which, if intelligently applied, can be turned into a balance at the bank. The pity of it is that comparatively few men have got either sense or energy enough to utilize them.

I always feel somewhat uneasy when the Legislature is in session for it nearly always means a lot of fool laws for which there is no public necessity. What the Country needs just now is a chance to get back on its feet again rather than a lot of legislative patent medicine.

In order to farm well a farmer needs good tools. Look over the different farm implement advertisements in this issue carefully and write for their literature. It contains a vast fund of valuable information—for in most cases it is prepared by men who have given a lifetime of thought to these things.

Daniel Webster was one of the greatest lawyers the World ever produced and usually a number of other lawyers were associated with him in his great legal battles. Before going into a trial, Webster would ask each of these associates to think the case over carefully and investigate it from every standpoint. Then he would get them together and ask each man to express his views and as they talked he would pick out their good ideas and discard the impractical ones—and in the after years he attributed much of his success to this plan. Even so a farmer should talk things over with his neighbors and adopt the suggestions which are good and dismiss those that are worthless. Good ideas are the cheapest and freest things in the World and they are nearly always worth their weight in gold.

Somehow I think we are on the eve of better times. I feel it in my bones that we are going to have a good crop year in 1915. Surely the great foreign war gives the farmer the greatest opportunity he has had in years. Again, sometimes we imagine that things are worse than they really are. It reminds me, one day some years ago when I ran across an old fellow who had filled up on a little too much "personal liberty." As he stumbled out of the railroad station he happened to walk under a gutter that was pouring down the remains of an April shower which had come along a few moments before—and as he stood there under the deluge he looked up at me and said, "Beats the d—— how it's rainin' don't it?"

We will appreciate your kindness if you will speak a good word about The Missouri Farmer to your neighbor who may not take it.

THE AUTO-OILED WINDMILL WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. Two quarts of oil in the gear case of this 8-foot auto-oiled windmill will keep the gears and every bearing flooded with oil for a year or more.

The galvanized steel helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The mill needs oiling but once a year.

There is a windmill, known the world over as "the windmill which runs when all others stand still." This new windmill with gears and bearings flooded with oil runs in much less wind than that well known windmill.

The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The auto-oiled windmill, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable. Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof. There is no friction on any part of the furling device when the mill is running and very little when the wheel is furled.

A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service. A band brake, of the automobile type, is used, and it always holds.

The gear case contains two pairs of gears and the supply of oil. From this gear case the oil circulates to every bearing in a constant stream. It flows out through the friction washers in the hub of the wheel and is automatically returned to the gear case. Not a drop of oil can escape. It is used over and over. So long as there is any oil in the gear case the gears and every bearing will be flooded with oil.

If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Running water purifies itself—stagnant water, standing water, collects and retains impurities. If you pump from your well constantly all the water it can spare, the water that comes in to take its place will be pure. If the water in your well stands until you happen to want some, and you pump but little, then it is likely that surface water will flow into it and carry in impurities. The unsafe well is the one that has standing water. A flowing stream is the thing to be desired.

The auto-oiled windmill makes all this possible as it can run from one year's end to the other with practically no wear and no cost. If interested, write Aermotor Co., 1146 So. Campbell Ave., Chicago. Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. Water costs nothing. Use it. To let it stand is to abuse it.

We need and must have the best dealers everywhere. They need us if they are going to remain in the windmill business. Write right now.

Colorado Hams

Meat should be thoroughly chilled (animal heat removed) previous to being placed into cure, or it will not cure properly, will become pickle soaked, and sometimes sour in smoking. Sprinkle the bottom of the container with salt about one inch in depth. Place large pieces as hams on the bottom and smaller pieces between larger pieces, on top. Sprinkle each layer with salt to which a very small amount of salpeter and brown sugar has been added, using not more than six ounces of saltpeter and two pounds of brown sugar to one hundred pounds of meat. In place of brown sugar, cane sugar may be used. After the meat has been put down in the container, cover with pickle of the proportions of nine pounds of salt to five gallons of water. Add or place between the layers of meat three ounces of whole pepper, six ounces of Juniper berries, a small amount of bay leaves, and some garlic. Circulate pickle by drawing off once daily from bottom and sprinkle over top of the meat. Hams should be cured in about a month, and other pieces according to size. In summer the pickle should be boiled and then cooled before using. After curing, soak three minutes for each day in cure; then wash in hot water, wipe dry with cloth, and smoke.—H. S. Eakins, Colorado Agricultural College.

BIG MONEY IN POULTRY

The average farmer or farmer's wife doesn't realize the amount of money which can be made out of good Poultry. On too many farms the Hen is regarded as a side issue—as a means of supplying a few eggs and "frys" rather than as a real, substantial source of profit. In present day farming we need to utilize every opportunity to the fullest and few things will yield better returns than a flock of good chickens. Only the other day we received a letter from a good Missouri housewife who said that last year she not only produced enough eggs and chickens to supply her own table but that she made enough extra to buy a lot of new furniture. This year she is going at it harder than ever. Doubtless there are hundreds of others like her all over the state. Furthermore, there is real pleasure in raising chickens. Of course it takes a little work—but what is there in this World worth having that doesn't require some effort? So we hope that every farmer's wife in whose home The Missouri Farmer is a visitor will resolve to make some money out of Poultry this year. If you need new furniture or carpets, a new range, kitchen cabinet, a power washing machine, a new bath room outfit or furnace—why not let the hens pay for it? Of course, to begin with, you will need a good incubator. You will find several splendid machines advertised in this issue of the paper—and all of them are reliable. **The Missouri Farmer.**

CATTLE SITUATION FROM VIEW-POINT OF THE FEEDER

(Continued from page 2)

which bring easy and quick returns and his only contribution to the meat supply is a measly veal or a worn-out dairy cow. There is greater temptation than ever before to sell the corn at present high prices, but sober, thoughtful people who have their own best interests in mind, can easily see by past experience and their own future welfare, the far-sighted and more profitable way of enhancing their farms, their bank accounts and their future income from the farm by feeding the corn and rough feed into live stock.

The problem of supplying meat in adequate quantities to satisfy the hungry world at a price fair to the consumer, and yet leave a margin of profit to the producer, is one that must engage the best minds of the age. Discouraging features must be eliminated. Unstable market conditions whereby great losses are entailed without rhyme or reason and unfair competition should not be suffered without some resulting benefit. There must be a more substantial and certain reward —the glory of the occupation is great, but not acceptable as security at the Reserve Bank. Ever and anon we hear the question, "Why don't farmers produce more meat?" My answer to this question would be that in a majority of cases he has produced too much at too great a sacrifice and he cannot go on continually and forever playing the part of a good Samaritan to the balance of the human family. It would be idle to detail to you the many reasons why cattle are scarce, but suffice it to say that one prime cause lies in the fact that we have pursued a short-sighted policy in the conduct of the business from start to finish. The consuming blight of waste has laid a heavy tribute upon us, wasting the substances of our lands—waste in the production of our feed lots—waste in unskilled methods of handling—waste in improper marketing and waste of our own energies by not keeping a proper system of accounts whereby we can distinguish a profit from a loss. No other business on earth would prosper measured by the same rule we employ. We are too often skeptical towards advanced ideas in production. The profits are too lean to indulge extravagance and the wasteful man must come to grief. Organization has helped the packing industry wax fat from our labors; organization has enabled the commission man to make his own charges for services rendered, without let or hindrance. Then why should we not organize to preserve our very existence?

As to the immediate future of the cattle industry, no one can guess, but my observation has taught me that when the situation looks the least inviting, we can usually figure some profits in the end. In other words, don't follow the crowd. So while one crowd is just now clamoring to liquidate their fat cattle holdings at serious losses, it is well to sit tight and have a thought as to the future,—for we should not be surprised to find that this year will be the high water mark in prices, and that before the season is gone, we will awake to the realization of far off dreams.

In conclusion, I want to admonish the men who constitute the membership of this organization and who are from almost every corner of the state, that troublous times are ahead of us. It is not meant in a spirit of criticism, when I say, you must know your business; you must study it persistently and follow it energetically. Mark the changes which world conditions will force upon us; and keep pace with the progress of the age. If you would not come to grief, you must understand the art of conserving the soil, and employ the method that will best make it yield its greatest returns. You must know the quality and value and when to make your investments and likewise your liquidations. Practice the economies best suited to your individual case, then if the margin of profit be narrow, you may at least console yourself with the thought that you have fulfilled the high ideal of good citizenship by contributing your best efforts to the betterment of your own condition and the business you represent, not forgetting that the community and state will share your prosperity and that it is not our part to play, to dream, to drift, for we have had hard work to do and heavy loads to lift.

WINTER CARE OF BROOD SOWS

Proper care of the pregnant sow during winter demands that attention be paid to three things, namely: her feed, shelter and exercise. Neglect of any one of these three essentials may mean failure, even though the other two be watched carefully.

The most common mistake made in feeding the brood sow in winter is to supply too much corn. Perhaps not too many pounds of corn, but the corn ration is not properly supplemented with other feeds. There are several reasons why corn should not make up the entire ration for brood sows. It does not contain enough muscle and bone building nutrients to supply the needs of the brood sow. It is constipating in its effect and does not furnish bulk enough. It has a tendency to put on a large amount of internal fat which is injurious to the pigs in utero. Corn should be supplemented with a small amount of some feed like tankage, linseed oil meal, shipstuff, bran and the like. Some good legumninous hay such as alfalfa, clover, cowpea, etc., also supplies the needed protein bulk and produces the laxative effect desired. At the Missouri Agricultural Experiment Station it has been possible to materially decrease the cost of maintenance by using such hays. The same end is being reached at the College this season by the use of early sown rye pasture.

This brings us to the question of how to supply the necessary exercise. By placing hays, such as mentioned above, in racks and allowing the sows to eat at will, they are induced to exercise. The same thing is, of course, true if the sows are grazing on rye pasture.

The shelter for the pregnant sow need not be expensive to be efficient. The things to be guarded against are lack of space so that the sows "pile up," damp floors, filth and lack of sunshine.

It should not be necessary to add that the sow should be given opportunity to get all the pure water she will drink. Too much corn, lack of exercise and too little water result in constitpation—a thing which must be guarded against for best results with the brood sow. L. A. Weaver.

MAKING THE FARM PAY

During the last several months we have repeatedly pointed out that the great foreign war is certain to mean high prices for the products of the American farmer and for this reason every farmer should try to make 1915 count as never before. In the ordinary course of events, this should be a good crop year. We have now had three drouths out of the last four seasons—and surely this state of affairs will not keep up forever. So let's go in to win this year. To this end, every farmer should provide himself with up-to-date farm implements—tools which will enable him to make the most of his opportunities—and hence we suggest to our readers to look over the advertisements in The Missouri Farmer carefully and then drop the different manufacturers a postal card and ask for their literature—for all of it contains a world of useful information from which you will be able to glean many new and splendid ideas. Manuafcturers and business men generally are continually on the lookout for new devices which will save time and labor —and farmers should do likewise.

Just now, wide awake farmers are becoming keenly interested in farm tractors and during the last two months we have received many inquiries from farmers about them. A farm tractor which does the plowing and other heavy work on the farm—which doesn't eat while it isn't working—which doesn't have to be curried and watered—which doesn't get sick and die—all of these things are beginning to interest many farmers. Until within the last year, nearly all the tractors were too big and expensive. Now however, the International Harvester Co. in Chicago, the Avery Co. at Peoria, Ill., the Emerson-Brantingham Co. at Rockford, Ill., and the Joliet Oil Tractor Co., whose sales manager is located at Lenanon, Mo., are offering splendid, low priced tractors which pull a five or six horse load—enabling farmers to do their plowing and other heavy work much more quickly and dispense with the use of a half dozen horses or mules —and we suggest to those of our readers who are interested that they drop these four concerns a postal card and ask for the full particulars.

Another implement which will pay for itself the first year and which every farmer should possess is a manure spreader. Building up the soil is the chief problem of the hour—and a good manure spreader makes the spreading of manure an easy task and once you own one, it means you will not permit your manure to lie around and deteriorate. There are thousands of farmers in Missouri who have enough manure lying around their barns and feed lots to pay for a good spreader the first year several times over—and they will last for years. Look up the advertisements of the William Galloway Co. of Waterloo, Iowa, and the Rock Island Plow Co. of Rock Island, Ill., and ask them to send you their Spreader literature. The Galloway Co. also handles a line of Cream Separators and Gas Engines. The Rock Island Plow Co. also puts out a fine Cream Separator.

Few things are more important than a good corn planter and many farmers lose the price of a good one several times over each season by using an old, worn-out machine. You can't raise a full corn crop unless you get a full stand. The Hayes Pump and Planter Co. of Galva, Ill., is offering a new improved planter which should be fully investigated by every farmer who isn't supplied with a good one at this time. Let's go after a big corn crop this year. A good Corn Planter will last for years if you take care of it.

The Janesville Barb Wire Co. of Janesville, Wis., is offering a new steel fence post which is attracting a great deal of attention. It is said to last practically forever and to be cheaper in the long run than wooden posts. The Keystone Steel & Wire Co. of Peoria, Ill., offers to send free to every farmer who writes them a copy of Ropp's Calculator—a book which tells you how to calculate interest, determine the weight of hay. cattle, hogs, etc.

Few farmers realize what a great labor saver a small gasoline engine is on the average farm. It saws the stove wood, pumps stock water, runs the cream separator, feed grinder, washing machine, etc. Thousands of them have been sold during the last year or two. If you are interested, write to the Witte Iron Works, Kansas City, Mo., or the William Galloway Co. of Waterloo, Iowa. Their literature will tell you how you can save a lot of time and money with a small gas engine.

Darling & Co. of Chicako offer a free booklet on fertilizers and their uses which can be had for the asking. See their ad elsewhere.

The National Mfg. Co. of 1709 Locust St., Des Moines, Iowa, are offering a Hog Waterer which should interest hog raisers. It operates by means of a little oil stove which not only prevents water from freezing but keeps it warm day and night so that the hogs stomach doesn't become chilled. Ice cold water is a fat destroyer in all forms of live stock. Then too, it's troublesome to have to chop ice two or three times a day.

Every housewife should read carefully what the Aero Gas Machine Co. of St. Louis has to say. This means carrying the conveniences of the city to the country.

Few farmers attach enough importance to plowing which is the beginning of the seed bed—and upon the seed bed depends the crop. If you are using old dilapidated, out of date plows we would suggest that you send for the literature of the Rock Island Plow Co. and the Janesville Machine Co., whose ads you will find elsewhere. It will give you a lot of valuable plow facts.

If you raise calves it will be worth your while to look up the offer of the Blachford's Calf Meal Co. They are putting out a special calf food which many farmers have used with great satisfaction.

Just now we are carrying a fine line of live stock ads which should have the attention of every farmer who wants to get rid of "scrubs." In short, the advertisements of a farm paper are always worthy of being read carefully —for they deal with matters calculated to make farming more profitable and less irksome. When writing to our advertisers please always mention The Missouri Farmer.

IS YOUR HORSE WORTH $1.00?

YOUR MONEY BACK IF IT FAILS

You wouldn't keep a horse or any other animal very long if he wasn't worth a dollar, would you? If an animal is worth keeping at all he is worth keeping in good health. It costs only a dollar to keep a bottle of the old reliable

Feb. 24. Sheley & Clatterbuck, New Bloomfield, Mo.
Feb. 27. C. D. Caldwell, Minlan, Mo.

Poland Chinas

Feb. 11. Dr. John Gildow & Sons, Jamesport, Mo.
Feb. 17. W. E. Williams, Silex, Mo.
Feb. 19. W. A. Baker & Sons, Butler, Mo.

Baker's High Class Poland China Offering

On Friday, February 19th, W. A. Baker & Sons will sell at Butler, Mo., fifty head of real big type Poland China bred sows and gilts.

The Baker herd was one of the first strictly big type herds established in Missouri, and from its inception it has been regarded as one of the best.

The foundation blood of this herd came from the leading herds of the country, and the same care has since been exercised whenever new blood was needed.

The sale offering this year will consist of fifty head, including ten big quality bred sows; twenty fall yearlings and twenty spring gilts. The writer has seen this offering and does not hesitate to recommend this sale to our readers. You will find plenty of size and plenty of quality. The spring gilts should average well over three hundred pounds on sale day. They are bred just the same as those shown so successfully at the recent Missouri State Fair, where this firm won the following: Poland China Futurity: Fall boars—1, 3 and 4 on Hadley Look, Hadley Look 2nd, and Hadley Look 3rd. Fall sows—4 and 6 on Lady Look and Lady Look 2nd. Spring boars—6 and 7 on Big Hadley Look and Big Hadley Look 3rd. Spring gilts—5 on Maud Look. Spring pigs (litters of 4) 4th and 7th. In the general classes this firm won, third on aged boar; second on the under year boar; first on aged sow; third on junior yearling sow. They bred the boar that won first in the 18 months and under 24 class. They also won the Farmer and Stockman trophy.

Most of the offering will be bred to Big Look, third prize aged boar, and to Big Bone's Son Jr., the boar that Willey & Son won with in the under 12 months class, and to Missouri Wonder, one of the good sons of Blaine's Wonder.

The sale will be held in town and buyers from a distance will be entertained at the Fraternal Inn Hotel. This will be one of the good sales of the season and we urge all who are interested to write at once for the catalog—look over the breeding this firm is offering. R. P. Royce will attend this sale and parties who are unable to be there in person may send their bids to him and feel certain that they willl be handled honorably.

Remember the advertisement will not appear again so you should write at once. Kindly refer to this paper.

Last Call for Faulkner's Spotted Poland Sow Sale

For the last time we wish to direct the attention of our readers to the seventeenth annual bred sow sale to be held by H. L. Faulkner, at Jamesport, Mo., Wednesday, February 10th. Mr. Faulkner is too well known "as the preserver—not the originator of the old-fashioned Spotted Poland Chinas" to need any introduction at our hands. This year's offering is generally believed to be the best ever made from this famous herd. The sale will consist of sixty tried sows, yearlings and spring gilts—all carrying the best of Spotted blood, and all bred to genuine big-type Spotted boars.

The sale will be held in a heated tent and Mr. Faulkner extends a cordial invitation to every reader of this paper to be with him that day. Write for the catalog mentioning where you saw the ad.

R. P. Royce will represent this paper at the sale.

Taylor's Great Duroc Sale

Last week the writer visited the Springdale herd of Durocs owned by Chas. L. Taylor, Olean, Mo., and had the pleasure of looking over his sale offering that will be sold, Tuesday, February 23.

Fifty head are listed and take them by and large we doubt very much if any sale will contain more real high class animals and fewer plainer ones or as much grand champion blood.

This is strictly a Col. Wonder offering in as much as everything is either sired by this grand champion, or is bred to him or to two of his sons.

Mr. Taylor had planned to put his great sow, Belle of Missouri 3rd, grand champion sow at the recent Missouri State Fair, and her litter, in the sale, but she developed a caking of the udder and it was decided to put in Miss Crimson Col. I Am. This sow, a litter mate to the junior champion, Crimson Col. I Am is regarded as one of the best brood sows in the herd, and few, if any, better sows will be sold this year. She is an etxremely large sow —could be made to weigh 800 pounds, but she has quality from head to foot. Breeders looking for a sow that is good enough to go into any high class herd in the United States will make no mistake in buying her.

Another high class sow cataloged is Belle of Chiefs 3rd—a remarkably large, smooth, quality sow, that has proven her value.

Miss Crimson Wonder 2nd is a sow that would be an attraction in any herd. Instructoress, a daughter of the grand champion, Instructor, sells safe to the service of Col. Wonder

The spring gilts are one of the most attractive lots we have ever seen, possessing unusual size along with quality. They have been handled very carefully and have been fed just the same as though they were to be retained in the herd and by sale day will be presented in just the right condition, and will average well over 300 pounds—many of them weighing around 350 pounds. Good judges will disagree as to just which ones are the most desirable, but all will agree that among them are a goodly number that any breeder would be proud to own. The three litter sisters, Belle of Missouri 5th, 6th, and 7th, are show gilts with records already won, and are certain prospects to be carried on for next year. The gilt out of Queen Wonder is one that possesses everything breeders are looking for, and many will count her the best of the lot. The three litter sisters by Col. Wonder, out of a Mc.'s Dream dam are perhaps the largest of the gilts.

A great deal more could be said about this sale, but it is really not necessary. It is a high class offering, from a high class herd, and we take very keen pleasure in being able to refer our readers to the advertisement in this issue. Send for the catalog now. R. P. Royce will represent the paper and will handle any bids sent in by our readers who are unable to attend.

W. E. Williams Poland China Sale

We wish to direct the attention of our readers to the advertisement of W. E. Williams, Silex, Mo., in which he announces his annual sale of Poland China bred sows and gilts.

Mr. Williams has established one of the best herds of Polands in Missouri and his offering this year represents the cream of several years' effort to produce the kind of hog the farmer wants.

In the sale are included an even fifty head, consisting of five tried sows, twenty-five fall and spring yearlings and twenty spring gilts. The writer has seen this offering and does not hesitate to recommend it to the readers of this paper because he knows that they will be pleased with the kind Mr. Williams is selling.

Everything cataloged is of strictly big type breeding and carries the blood of many of the greatest boars of the breed. They have been fed intelligently and have plenty of size and bone and quality.

The writer does not know of a better lot of spring gilts that will be sold this year, and the yearlings and tried sows are good enough and big enough to suit most any one. Among the gilts are a number that deserve particular notice. There is an extraordinarily good one by Longfellow Sampson, and out of a Blaine's Wonder sow. A litter sister to this gilt was shown at a number of Kentucky fairs the past fall and is reported to have won nearly everywhere shown. Another good one is by Longfellow Sampson, and out of a W's Major sow; while still another by Wonder and out of a Pawnee Nelson dam is perhaps the best in the bunch.

Among the yearlings offered are two by Black Jones 2nd, out of an Expansive Quality sow that are real attractions.

The spring gilts are mostly by Mr. Williams' great boar Longfellow Sampson; Cloverdale Hadley, Chief Price Jr., and Wonder—the latter is a Peter Mauw bred boar.

The yearlings are by Black Jones 2nd and Big Jones 3rd and Expansive's Quality. The tried sows are by Hadley Blaine, Ex. B and others.

Here is a sale that you should make every effort to attend—and it merits the patronage of anyone who is contemplating buying the good kind. The ad will not appear again and we therefore urge that you write Mr. Williams at once and ask for his catalog. Note the breeding he has to offer and then make arrangements to attend the sale.

R. P. Royce will represent this sale and any bids entrusted to him will receive careful and honest treatment. Kindly mention The Missouri Farmer when writing.

Last Call for Porterfields Duroc Sow Sale

This is the last time we can remind our readers of the sale of Duroc bred sows and gilts to be made by J. A. Porterfield, at Jamesport, Mo., Monday, February 8th.

Many readers of this paper have purchased Durocs from Mr. Porterfield, and to them it will not be necessary to more than mention this sale. For those who are not familiar with this herd we will say that it is held in the very highest regard by breeders throughout the State and the annual sales held at Jamesport have always proven very satisfactory sources from which to secure breeding stock.

The offering this year is easily the best yet made from this herd and will consist of forty-five head, including twenty-one big stretchy fall yearlings and twenty-four spring gilts. The fall yearlings are mostly by Col. Model Top by the champion Beauty's Model Top, and for the most part are bred to the great boar Top Inventor, and to Auctioneer 2nd. A word about these two boars. Top Inventor is one of the largest Duroc boars in Missouri. He was shown at the 1914 Missouri State Fair and in spite of the fact that he was four years old before he was fitted he won third place in the aged boar class, and was conceded to be the largest Duroc on the grounds; Auctioneer 2nd, is by Auctioneer, a Crimson Wonder bred boar owned by B. W. Harned. Several are bred to Graceful Lad, by Beauty's Model Top. This boar was placed second in a class of twenty-six at Sedalia, a good record for any boar.

Among the fall yearlings are two by Top Inventor, and bred to Graceful Lad, that are genuine attractions. All of the yearlings have plenty of size, and bone, and excellent quality. Indeed, they would look well in anybody's sale.

Fifteen of the spring gilts are by Top Inventor; three are by High Model 2d out of a Col. Gano sow; six are by Golden Model 3rd, out of a King Colonel 2d sow.

THOMAS. E. DEEM
AUCTIONEER
Selling pedigreed live stock is my specialty. Eight years of success in this line has proven that my customers are pleased.
Dependable service at a reasonable charge. Address, Cameron, Mo.

GALLOWAY CATTLE
Young stock for sale at all times. Herd established 25 years
J. & W. R. CLELLAND,
New Hampton, Mo.

ChoiceAberdeen-Angus
Established 30 years. 100 head in herd. I am offering good useful Bulls. and Heifers of excellent individual merit and breeding. Prices reasonable. Our customers make them popular.
D. L. Sutherland & Sons Windsor, Mo.

Aberdeen-Angus I am offering a number of young bulls, cows and heifers —good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
J. D. Blackwell Fayette, Mo.

ANGUS CATTLE
HERD FOUNDED 1904
Seven early calves—3 BULLS and 4 HEIFERS, sired by Dean's Eric 139686 Every one the right kind, and priced to sell.
V. E. LAWRENCE, SALISBURY, MO.

Whiteford Herefords
A strictly high-class herd of best breeding and individuality. Headed by the great bull
HUGH WHITEFORD, GUILFORD, MO.

IDLEWILD SHORTHORN CATTLE
Milk and Beef Type. Dual purpose in name and in fact. Herd 50 years old. In one family, on one farm. The type is fixed. I have a strain that I believe rivals the famous Duchesses. Fine beef cattle that are heavy milkers. And deep milkers of fine beef type. Call, or this blood is safe by order
W. P. Harned, Vermont, Mo.

PEABODY FARM SHORTHORN CATTLE & BERKSHIRE HOGS
We are offering 10 good young bulls, well bred 3 roans, 5 reds, 6 to 13 months old. Also a few extra good young boars, two of them fit to herd first-class herds. Choice young Bronze Toms and Barred Rock Cockerels.
JUNE K. KING & SONS
MARSHALL, MO.

ELM LAWN HERD IMPROVED CHESTER WHITE SWINE Choice boars and gilts of September and October farrow for sale at reasonable prices. Everything recorded free.
W.B.Taylor and Sons,Weatherby,Mo.

RAUSCHER'S CHESTER WHITES!
One of the Oldest Herds in the West
A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.
H. Rauscher & Son, Kahoka, Mo.

MISSOURI VALLEY HERD O. I. C. SWINE
We have a fine bunch of fall pigs from mature stock on the "bargain counter" for quick delivery. Everything guaranteed as represented. Call on or write
J. M. Dryden, Phelps City,Mo.

These gilts are bred to Graceful Lad, Auctioneer 2nd, and Big Wonder 2nd. If you are looking for a gilt that will develop into a large brood sow you will find what you want in this sale. Perhaps the six by Top Inventor out of the good sow Mabel 3rd, will strike the fancy of most buyers, but the three by High Model 2nd are going to look mighty nice.

In conclusion we simply want to say that we recommend this sale, and trust that our readers will give it the support it deserves. Write for the catalog, if you haven't already written, and kindly mention The Missouri Farmer. R. P. Royce will represent this paper.

Blackwell Angus Offering

J. D. Blackwell of Fayette, Mo., is offering some well bred registered Aberdeen-Angus cows and heifers due to calf in early spring to the service of two of his show bulls. Also some registered yearling Angus heifers and about a car load of young bulls running from ages of 9 to 12 months old, also a few bulls from 15 months to 18 months old. It will be well to get Mr. Blackwell's prices before buying. Mention The Missouri Farmer.

A High Class Hereford Sale

Readers of this paper who are in the market for high class Herefords should bear in mind that on Monday, February 8th, Mr. Hugh Whiteford, Guilford, Mo., will sell a very select offering at South Omaha, Nebraska.

In the lot to be sold are a number of real herd heading bulls—in particular might be mentioned the good four year old, Parsifal 24th, one of the very best sons of the well known Parsifal. This young bull has been used in the Whiteford herd and his ability as a sire will be shown by a number of his calves that are also consigned to the sale. The cows cataloged are all either bred or have calves at foot and many competent judges assert that they are one of the best lots ever put through a sale. There will also be a number of very choice heifers listed.

This sale affords a rare opportunity to purchase meritorious breeding cattle from one of the best known herds in the country, and we take pleasure in referring our readers to this sale and to urge them to write for the catalog. Kindly mention this paper.

Weller's Durocs

The ad of J. E. Weller, Faucett, Mo., appears in this issue of The Missouri Farmer and while the name is new to a good many of our readers, we want to say Mr. Weller is by no means a new hand at breeding Duroc Jersey swine. He has one of the good herds of over 100 head, and at present is offering a number of first-class boars ready for service, also gilts bred for spring farrow. The entire herd has been immuned, a point prospective buyers should not overlook, and when it comes to bone, breeding, size and quality, they are right, and more than that, the price is right. If on the market for anything in Durocs look up his ad and write him. He is a reliable man, a good judge of breeding stock and any order placed with him will be treated fairly. He makes but one price on any of his stock. A boy can buy as cheap as a man. In writing please mention this paper.

Report of Sheley & Clatterbuck's Sale

The sale of fifty bred sows from the herd of Sheley & Clatterbuck, New Bloomfield, Mo., on Wednesday, January 20th, resulted in an average of $40.70. This was hardly up to expectations, nor was it what the sale merited. A number of prominent breeders were present and took most of the choicer lots at good prices. Mr. J. H. Higgins, manager of the swine department of Longview Farm, was the heaviest buyer and secured the great sow Edna's Beauty, for $188, the top of the sale.

Col. E. Z. Russel, Omaha, Nebraska, conducted the sale and made a decided hit. This was Col. Russel's first sale in Missouri. He was assisted by A. C. Buckingham and G. E. Gyger.

The big-type, big-bone, quality kind, BIG ORANGE, A. WONDER and PAWNEE LAD breeding. Bred to MISSOURI KING by IOWA'S KING, for March and April farrow. They are big and priced to sell. Write at once.

Obadiah Prettyman, Fairfax, Mo

BARRED ROCK COCKERELS

I have a few choice birds and will make very low prices on two or more to one customer. Also anything you want in Jersey cattle.

J. B. SMITH, Platte City, Mo.

Percheron Stallion for Sale. Good breeder and good style and action. Will sell at bargain. C. W. Garhart, Salisbury, Mo.

Indian Runner Ducks, White and Fawn. Eggs $1 for 15. Ruth Marksbury, Marshall, Mo. 216

Fawn and White Indian Runner Ducks, White Orpington Cockerels. Extra qualtiy, reasonable prices. Fred A. Foote, Hollister, Mo. 21tf

Have a good building lot 75x180, sidewalk, macadam street, water, light and sewer, building restrictions. Would trade for brood mares or mules. W. E. Edwards, Columbia, Mo. 211

Surely a splendid paper like The Missouri Farmer is worth the small price of 33 1-3 cents per year? It is clean from start to finish. Its information is reliable. It stands for Better Farming, Better Farm Homes, Better Citizenship. Send us a dollar bill today at our risk.

Sheley & Clatterbuck's Bred Gilt Sale

Just before going to press Sheley and Clatterbuck, New Bloomfield, Mo., wrote us that they were planning to hold a sale of bred gilts, from their well known Duroc herd, sometime during the latter part of February. At this time the date is not positively known, for the reason that they have not heard from their auctioneer, but in all probability it will be held February 24, the day following Chas. L. Taylor's sale at Olean.

The coming sale will consist almost entirely of fall yearlings and spring gilts, sired by the champions, Beauty's Model Top, and Instructor, and the prize winning S & C's Valley Chief, and Col. Primm. A number of real attractions will be offered and the entire offering will be one of very high class.

Please bear the sale in mind, and as it will probably be held the day following the Taylor sale, buyers should arrange to attend both sales. Get your name on their mailing list for the catalog.

Caldwell's Duroc Sale

Elsewhere in this paper C. D. Caldwell announces that on Saturday, February 27, he will sell about forty bred sows, yearlings and gilts, at Milan, Mo.

Mr. Caldwell has been engaged several years in building up his herd and the offering to be sold is a very creditable one.

Readers of this paper who are interested in buying some good useful sows or gilts are urged to write Mr. Caldwell for his catalog. We will have more detailed information concerning this sale in our next issue.

Prettyman's Poland China Bred Gilts

Elsewhere in this paper will be found the advertisement of Obadiah Prettyman, Fairfax, Mo., in which he offers about twenty-five cracking good Poland China spring gilts.

Mrs. Prettyman has been breeding pure bred hogs over twenty years, and while he has not gone into the business on quite as large scale as some, he has at all times exercised very keen judgment in the purchase of his breeding stock. The dams of these gilts are rich in the blood of such noted boars as A. Wonder, Big Orange, and Pawnee Lad, and they are bred to the good young boar, Missouri King, a son of J. O. James' Iowa King. The dam of Missouri King sold open last fall for $245.

Heretofore, Mr. Prettyman has been depending entirely on his home trade to take his surplus stock, and could still sell them at home, but he feels that he would like to build up a wider trade. These gilts have plenty of size and bone and quality, are certainly as well bred as one could wish and at the prices asked we would say they represented bargains. Look up the ad and wrtie Mr. Prettyman and we assure you that you will like the kind he is offering.

DUROC MEN MEET

One of the most successful association meetings held at Columbia during Farmers' Week was the annual meeting of the Missouri Duroc-Jersey Swine Breeders' Association. This organization has been in existence a little over a year but in that time it has been a very potent force in pushing the Duroc hog in this state and if present plans materialize the coming year will witness marked advancement of the breed. One afternoon was given over to a very interesting and instructive program. Prof. Herbert W. Mumford, professor of Animal Husbandry at the University of Illinois, and a prominent breeder of Durocs, delivered a highly interesting lecture on the hundred sires and dams that had rendered the most valuable service to the breed. A. T. Cole, of the Farmer and Stockman spoke on "Practical Advertising." R. P. Royce spoke on the subject of "Salesmanship." L. A. Weaver of the College of Agriculture, read a paper from J. H. S. Johnstone, in which a plan for a futurity show of Missouri Durocs was outlined. Prof. E. A. Trowbridge told of the plans for an extensive Missouri livestock exhibit at the Panama-Pacific Exposition and urged all the breeders present to make an effort to have their herds represented at this great show.

The business meeting was held the following afternoon, and plans were discussed for inaugurating a futurity show at the Missouri State Fair this year. The idea proved very popular and it was decided to make every effort to hold such a show. All Duroc breeders who are interested in a futurity, and every breeder should be, can secure full information by writing the Secretary, R. L. Hill, Columbia, Mo.

CHAS. L. TAYLOR'S

Sale of

DUROC SOWS AND GILTS

OLEAN, - - - - MISSOURI

TUESDAY, FEBRUARY 23.

FIFTY BRED SOWS AND GILTS

This is my first public sale of CHAMPION COL. WONDER DUROCS. Included in the offering are 10 TRIED SOWS and 40 SPRING GILTS.. All are either sired by COL. WONDER or are bred to him or one of his sons. Among those offered are a number of prize winners at the Missouri State Fair. Others are litter mates to prize winners. Some are certain show prospects. NO SALE WILL CONTAIN MORE PRIZE WINNING BLOOD. IF YOU WANT SIZE AND BONE AND QUALITY, ATTEND THIS SALE.

COL. WONDER SIRES MY CHAMPIONS; HE WILL SIRE CHAMPIONS FOR YOU.

Catalog mailed on request.

Auctioneers: H. S. Allen; J. M. McGinnis.

R. P. Royce will represent this paper.

CHAS. L. TAYLOR, Olean, Mo.

LIVE STOCK LECTURES AND DEMONSTRATIONS

An increased amount of interest in live stock production was in evidence during Farmers' Week at Columbia, January 11-16, as compared with that of former years.

The Animal Husbandry Department of the College of Agriculture had outlined a very creditable program and the visiting farmers showed their appreciation by their attendance and the intense interest that was shown at all of these meetings. There were twenty-one meetings all together and the average attendance at each meeting was 170 with a total attendance of 2990 for all the meetings. The meetings consisted of lectures and demonstrations along the most practical lines of live stock production, such as feeding problems, management, use of pure bred sires, and the selection and judging of the different classes of live stock.

Besides the lectures there were two judging demonstrations each morning at 10:30 o'clock given by the various men in the Department of Animal Husbandry, assisted by practical farmers and live stock men. Mr. Charles Green of Centralia, Mo., gave a very practical and interesting demonstration on the judging of mules, with special reference to the market demands and the relative value of different classes of mules. Mr. E. Z. Russell of Benson, Nebraska, treasurer of the National Duroc Jersey Association, gave one of the most interesting demonstrations of the week, on the judging and selection of breeding hogs, taking the situation up from the standpoint of the breeder and producer of market hogs.

A very noticeable feature of these meetings was the percentage of actual farmers in attendance, men that are trying to solve the problems of the farm today and not retired farmers or world-be farmers, and from the interest shown it would lead one to conclude that the farmers of Missouri are awakening to the fact that more and better live stock on Missouri farms means increased profits as well as increased fertility.

The meetings of the various live stock associations of the state were held in the afternoon of each day and much interest was hsown in these meetings, which again goes to show that Missouri stockmen are beginning to realize the value of organized efforts. These associations are as follows: Draft Horse Breeders' Association, Missouri Saddle Hore Breeders' Association, Missouri Cattle, Swine and Sheep Breeders' Association, Missouri Sheep Breeders' and Feeders' Association and Missouri Duroc Jersey Breeders' Association. Several important resolutions were drawn by these associations to be presented before the Missouri Legislature this year, the important ones being: Stallion Registration Law, for the protection of the horse industry of Missouri; a Dog Law, for the protection of the live stock industry in general against the worthless dogs of the state; Pure Seed Law and Pure Feed Inspection.

The Department of Animal Husbandry of the College of Agriculture stands as a servant to the people of Missouri and in so far as it is possible will cheerfully give all the aid they can to the people of the state.

F. L. Bentley.

Don't Let Down the Bars to Stock Diseases

Contagious diseases that carry off thousands of hogs, sheep, horses and cattle, can be prevented. It is not a matter for one stockman or farmer. Every man who raises stock should not only use great care as to sanitary conditions, but a bitter war must be fought against stomach and intestinal worms.

It is admitted that lime should be liberally scattered in the pens and yards, as a disinfectiont; that all rubbish be cleaned up regularly and burned—that stock should be kept free from worms. Comparatively few farmers do this, and unless there is more concerted action along this line there will always be contagious diseases, and serious loss.

Worms are more dangerous than many imagine. They cause 90 per cent of live stock losses. They not only infest young stock, but if left undisturbed, burrow into the inner walls, forming ulcerous, worm-infested patches. They multiply rapidly —consume the vitality of the animal and in many cases cause death.

There are various methods employed to rid stock of worms, but the easiest, quickest and safest way—now used by successful stockman—if feeding Sal-vet. Mr. Sidney R. Feil, president of The Feil Mfg. Co., Cleveland, Ohio, is so firmly convinced of the great value of Sal-vet as a worm destroyer and conditioner that he agrees to send enough to feed all your stock for 60 days—asks no money in advance—and if it fails to do what he claims, he cancels the charge. The Sal-vet advertisement on the last page of this paper gives the full particulars.

W. A. Baker & Sons' Annual Bred Sow Sale

50 Real Big Type Poland China Sows and Gilts

ALL IMMUNE

Friday, February 16, 1915

BUTLER, MISSOURI

10 Tried Sows: 20 Fall Yearlings: 20 Spring Gilts

Our offering this year we believe will be one of the very best that you will have an opportunity to bid on. We have at all times endeavored to combine size, bone smoothness and quality and our winnings the past few years at the leading shows are proof that THE KIND WE BREED ARE THE KIND THAT WIN.

These Sows and Gilts are bred to BIG LOOK 63604; BIG BONE'S SON JR., 71340, and MISSOURI WONDER 55408. EVERY BOAR A PRIZE WINNER. The dams of this offering carry the blood of BIG HADLEY, BLAINE'S WONDER, GREAT LOOK, EXPANSION WONDER, and other great boars. Bred along the same lines as our FUTURITY WINNERS.

Catalog will be sent to all who apply, mentioning this paper. R. P. ROYCE will represent The Missouri Farmer and bids sent to him, in my care, will be handled fairly.

AUCTIONEERS: R. L. Harriman, C. F. Beard, C. E. Robbins, F. A. Taylor.

W. A. Baker & Sons - - - Butler, Mo.

Gildow's Dispersion Sale.

On Thursday, February 11th, Dr. John Gildow & Sons, Jamesport, Mo., will disperse their entire herd of big type Poland Chinas. Messrs. Gildow have been among the leading breeders of this state and the dispersal of their Plainview herd is a distinct loss to the breeding interests of Missouri.

Included in the offering of fifty-five tried sows, yearlings and gilts, might be mentioned the following proven tried sows:

Expansion Belle by Expansion's Son, dam Prima Bell, by Bellmetal. This sow is a litter mate to the first prize junior yearling at St. Joseph in 1913, that defeated the grand champion from Topeka. Lady Big Knox, by Big Knox, is a half sister to the grand champion boar at Des Moines in 1912. White Sox, by Pawnee Chief Hadley, is the dam of first prize Futurity winners, both individual and litter, at the Kansas State Fair at Hutchison in 1912. She is also the dam of the first and second prize yearling sows at the Missouri State Fair in 1913, and she is also the dam of the junior champion sow at the American Royal the same year. Lady King by old Long King is another good brood sow. Shiela Expansion and Goldie Expansion by Expansion's Son are cataloged. Pawnee Beauty by Pawnee Price is a mighty good kind to own. Nancy Wonder, by Expansion Wonder, was the top sow in J. F. Richards & Sons' last sale. Besides the above there are ten big fall yearlings, and twenty nice, stretchy spring gilts, by Pawnee Chief Hadley, Pawnee Price and Columbus Again. Most of the sows are bred to Pawnee Chief Hadley and Bell's A. Wonder, by A. Wonder. The dam of this last named boar was Mammoth Giantess 1st, by Long King. Part of the gilts are bred to Owen's Wonder by Joe Wonder 2nd.

Everything offered went through the cholera last summer and has since been given the simultaneous treatment. They should be immune for life.

Remember that in this sale you will have an opportunity to buy sows that ordinarily would be retained in the herd. Many of them have show records of their own, and others are the dams of prize winning stuff.

Keep this sale in mind and write at once for the catalog. R. P. Royce will attend this sale in the interest of any of our readers.

Thomson's Duroc Bargains

Kindly note the change in the advertisement of W. H. and Geo. E. Thomson as it appears elsewhere in this issue. This firm is now offering four fall yearling gilts sired by their former herd boar, Columbus, bred to I Am Col. Enough and Beauty's Col.; six spring boars, that are crackerjacks sired by the great Golden Model 34th, and Col. Wonder 2nd, one of the best sons of the champion Col. Wonder. Besides the above they are pricing a number of attractive fall boar pigs by Beauty's Col. Everything this firm offers is guaranteed and we would suggest that you write them at once for prices.

MISSOURI DRAFT HORSE BREEDERS MEET

(By E. A. Trowbridge, Secretary)

The Missouri Draft Horse Breeders' Assocaition met on Tuesday, January 12, 1915. An interesting program had been arranged and resulted in free discussion of the matter.

Mr. J. F. Roelofson, in the president's address, called attention to the permanancy of the draft horse business; to the shortage in European countries; to the demand which would be made upon us by the European countries in the near future; and urged those interested in agriculture, who could possibly utilize draft mares for work, to invest in a few pure-bred draft mares.

Mr. Roelofson's discussion was followed by a paper by W. M. Roberts. Mr. Roberts is a young farmer of Maysville, Mo., and is a graduate of the Short Course in Agriculture in the University of Missouri. He outlined his topics, discussing first the value of education and the use of good horses. He called attention to the value of the Short Course or Long Course in Agriculture in a college; to the good papers which can now be secured at reasonable rates, dealing with the subject of draft horses and their usefulness. He pointed out that in buying, men must know both the horse and his pedigree, that his development was an all important factor; and that in selling, reasonable and profitable prices could be secured for good horses. He urged upon those present, co-operation in the buying of the very best stallions possible and co-operation in handling and selling the product of the horse business.

The paper was followed by a discussion by Dr. C. M. McWilliams, County Agent for Cape Girardeau County. Dr. McWilliams, whose experience has been rather extensive, recounted the gradual upbuilding of the horse business in various communities where draft horses had not been popular and only became popular through their extreme usefulness. In his opinion, the draft mare is a very valuable farm asset from the fact that she produces the most salable kind of mules.

A paper prepared by Mr. Wm. Hartman, Baring, Mo., was read. Mr. Hartman will be remembered as the man who bred the good colt, Governor Major, which was a winner in the first Belgian Futurity at the Iowa State Fair. Mr. Hartman recounted his starting in the pure-bred draft horse business and bore the same testiment of the pure-bred draft mares for farm work and the profit from the sale of their colts, laying special emphasis on the use of good animals and liberal "feed bucket" cross. Mr. Hartman's discussion, coming from a man of his experience, who actually started with draft horses as a means of making money, was of particular value to all concerned.

Professor Montgomery of the Minnesota College of Agriculture then discussed the matter of the stallion law in operation in Minnesota, calling attention to the weaknesses and the strengths of it, making suggestions which might prove helpful, recommending to the Missouri Draft Horse Breeders' Association that a law of some sort operative in this state would be of immense value to the horse breeding interests.

Resolutions were adopted, urging the State Legislature to duplicate premiums won by Missouri Exhibitors on Missouri Live Stock at the Panama Pacific Exposition; urging the passing of a Stallion Law such as the one now operating in Kansas; urging the passing of a Pure Seed Law and a Feeding Stuffs Law; the passing of a Dog Law for sheep protection; and an appropraition sufficient to make it possible for the Extension Service of the Agricultural College in order to secure the Federal Government appropriation which must be duplicated by the State. The meeting adjourned at 5:30 p. m.

MISSOURI SHEEP FEEDERS' MEET

The Missouri Sheep Breeders' and Feeders' held their annual program on Tuesday afternoon, Jan. 12th. A very interesting meeting was held and the attendance was better than usual.

Mr. Geo. Dahlenberg, of the St. Joseph Wool Company, St. Joseph, Mo., presented a very interesting and highly instructive talk on the various phases of the wool question, with special reference to the marketing of the wool. Mr. Dahlenberg's special plea was for the Missouri farmer to increase the quality of his wool stating that Missouri had as good sheep, if their wool was properly grown and taken care of, as Ohio but that the present condition of Missouri wool when sent to market makes it worth from 2 to 3 cents less per pound than the same quality of wool in Ohio. Rolling up tag ends, dirt and other foreign matter is another factor that decreases the value of the Missouri wools, also the fact that some of the wool is tied with binder twine makes much of the wool inferior in value. When a fleece is tied with this kind of twine it is worth from 2 to 3 cents less per pound. It is well worth any man's time to be more careful.

Mr. Bryce Walker of Memphis, Mo., told some of his very interesting experiences and gave some very wholesome advice to young sheep breeders.

Mr. Geo. B Ellis presented the dog law question and discussed the possibilities and necessity of a dog law in Missouri. However, time prevented further discussion of this phase of the sheep industry. The meeting adjourned until Friday afternoon to take up the discussion of the dog question in this state.

The model bill sent out by the American Shropshire Registry Association was taken up and favorably discussed.

All Missouri sheep men interested in the enactment of a law protecting live stock and poultry men against dogs should get in communication with the Secretary of the Missouri Sheep Breeders' and Feeders' Association.

Howard Hackedorn,
Secreary-Treasurer.

Williamson's Polands and Shorthorns

H. S. Williamson, Centralia, Mo., has an excellent lot of heavy boned, well grown Poland China spring gilts, bred for early spring farrow, and the prices he is asking for them should prove very attractive. The Williamson herd has an established reputation for size and bone and quality, and everything is sold on a positive guarantee.

Peabody Farm's Shorthorn Bull Offering

June K. King & Sons, Marshall, Mo., are offering some good young Shorthorn bulls at prices that should make money for the purchaser.

The Peabody herd was established in 1877 by a purchase of seventeen high class cows and a bull, and ever since, a high standard of excellence has been maintained. They also have one of the best Berkshire herds in the Corn Belt and at present are offering a number of choice spring gilts bred to farrow in March and April.

In writing we would appreciate having you mention the paper.

Sutherland's Angus

D. L. Sutherland & Sons, Windsor, Mo., who advertise their Angus herd in this paper, are now offering several corking good young bulls and a number of choice heifers. This herd has been established over thirty years and has been a prominent factor in the notable success Messrs. Sutherland have made. They have found that it takes live stock to maintain the fertility of the soil and they have proven that pure bred cattle are more profitable than grades. Write them for prices.

Megown's Poland China Bred Gilt Bargains

B. B. Megown, New London, Mo., is advertising a number of big stretchy Poland China spring gilts, bred for March and April farrow. These gilts are bred along the most popular lines, representing such boars as A. Wonder, Big Orange, Mo. Orange, and others. In view of the fact that Mr. Megown has decided to handle only Spotted Polands in the future, he is prepared to make low prices on this stuff in order to move it quickly. Get his prices and mention this paper when writing.

W. E. WILLIAMS' GREATEST SALE

50 BIG-TYPE POLAND CHINA SOWS AND GILTS

Silex, Missouri, Wednesday, February 17, 1915

50 HEAD

20 Spring Gilts

25 Fall & Spring Yearlings

5 Tried Sows

All Immune

50 HEAD

20 Spring Gilts

25 Fall & Spring Yearlings

5 Tried Sows

All Immune

Farrowed August 21, 1912. Weighed 840 lbs. September 30, 1914. 10½ in. bone.

This offering represents the best lot of tried sows, fall and spring yearlings and spring gilts I have ever cataloged. They are sired by LONGFELLOW SAMPSON, CLOVERDALE HADLEY, BLACK JONES 2nd, CHIEF PRICE Jr., WONDER, and are out of sows by BLAINE'S WONDER, HADLEY BLAINE, LONGFELLOW Jr., PAWNEE NELSON, YOUNG LOOK, W'S WONDER, and other noted boars. Bred to LONGFELLOW SAMPSON, CLOVERDALE HADLEY AND PRICE WONDER.

The offering has been grown and fed with care and every sow or gilt listed will make good for the buyer. This is a sale that will not disappoint.

Send for catalog mentioning this paper. R. P. ROYCE will represent this paper and any bids sent to him, in my care, will receive honest treatment.

W. E. WILLIAMS - - Silex, Missouri

Porterfield's Annual

DUROC SALE

TO BE HELD AT

JAMESPORT, MO.

Monday, February 8th

45 Yearlings and Spring Gilts

My offering this year is by far the best that I have ever made. I will sell:

21 Fall yearlings by COL. MODEL TOP, a son of the CHAMPION BEAUTY'S MODEL TOP, and bred to either a son of BIG WONDER or to AUCTIONEER 2nd, by AUCTIONEER.

20 SPRING GILTS by the great boar TOP INVENTOR, the largest boar shown at the 1914 Missouri State Fair, and bred to GRACEFUL LAD, the second prize senior yearling son of BEAUTY'S MODEL TOP.

4 SPRING GILTS by HIGH MODEL 2nd out of a COL. GANO dam.

Everything listed is immune to Cholera. The catalog will be sent to all who apply mentioning The Missouri Farmer.

AUCTIONEERS: Thos. E. Deem, Chas. Nelson, D. D. Deem, A. J. Thompson, A. C. Buckingham.

R. P. ROYCE will represent this paper

Gildow's Dispersion Sale of

Big Type Poland Chinas

JAMESPORT, MISSOURI

Thursday, Feb. 11, 1915

Owing to a recent business change it has become necessary for us to close out our entire herd of strictly big type Poland Chinas and on Thursday, February 11, we will offer at public sale

55 Tried Sows Yearlings and Gilts

including 15 tried sows—our own brood sows that have produced our show herds, 10 big fall yearlings, 30 spring gilts. Practically every prominent line of blood known to the breed is represented. The entire offering will be bred to PAWNEE CHIEF HADLEY, BIG BILL TAFT and other good boars.

You can not afford to miss this sale as it will afford an opportunity to secure breeding stock of unquestioned merit.

Catalogs will be mailed on request.

R. P. Royce will represent The Missouri Farmer and will handle bids for those who are unable to attend in person.

Dr. John Gildow & Sons

Jamesport, - - - - Missouri

"The Sal-Vet has given full satisfaction, the best proof of its merits being that I have not had a single hog sick; it also brought my stunted pigs along well. My neighbors have been losing hogs from some sickness." James A. House, Jr. Sullivan, Mo.

"I find Sal-Vet exactly as recommended by you. I have lost none of my hogs, but most of my neighbors have lost theirs. I find it excellent for horses and cattle also—all of my stock are now in good condition." C. R. Gilchrist, Oronogo, Mo.

"I am feeding Sal-Vet and find it is without doubt the best medicine for hogs I ever saw. It is ridding my hogs of worm by the hundred, and I am recommending it to my neighbors, several of whom have decided to feed it too." Walter Gray, Rt 4, Huntsville, Mo.

"Ever since feeding 'Sal-Vet' my hogs and other stock have been doing fine, but hogs belonging to neighbors are dying on all sides." H. O. Linhardt, Lohman, Mo.

"My hogs have been doing fine since feeding Sal-Vet. Hogs are dying all around us here, but thus far I have not had a loss." C. W. Buck, Savannah, Mo.

"Sal-Vet is one of the best sellers ever put on the market. One of my customers is a big feeder who had been giving his hogs a home-made mixture of lye, ashes and salt, and thought that his hogs were entirely free from worms. However, I induced him to give Sal-Vet a trial, and he was soon convinced that his hogs had been loaded with them." L. W. Horner, Blackburn, Mo.

Safeguard Your Stock—Rid Them of Disease-Breeding Worms

You can't expect big profits and big prices for your stock unless they are kept in the pink of condition. And you cannot put them in good condition unless they are free from worms. Worms multiply rapidly, and are known to cause 90 per cent of all stock losses—because they keep animals in a run-down, unthrifty condition—unable to get the good of the food given them. The best of care and feed will not put fat on a wormy animal, nor prevent disease.

In their wild state all animals instinctively sought the roots, herbs and barks that kept them healthy. **Domestic animals require a worm destroyer and conditioner to keep them healthy.**

The Great Worm Destroyer

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

and Live Stock Conditioner

—is a "Safety First" preparation. It's mission is to rid stock of dangerous disease-breeding worms. In order that animals will more readily take the drugs which destroy worms, and the tonics which improve the digestion and tone up the system, these drugs are combined with salt in such proportions, that while the animals are satisfying their natural desire for salt, they are doctoring themselves. No dosing—no drenching—no starving. They take on new vigor and soon grow into profit. Read the following letters:

"I must say that I found SAL-VET a very good tonic and worm destroyer. I noticed worms pass from one colt, and since that time the colt has been doing nicely, and growing rapidly. My brood mares are in better flesh than I ever had them before, on practically the same feed. Cattle and hogs are doing very nicely, also." —Harry Vincent, Hanoverton, Ohio.

"I have been feeding SAL-VET to my hogs, and they passed a lot of worms. When I butchered some of the hogs, I could not find a single worm, nor a sign of a worm in any of them. My neighbors lost all of the hogs they had, but I have not lost a single one." —John Sauer, Fort Wayne, Indiana.

"The seven head of horses to which I have been feeding SAL-VET are now feeling fine, and look as sleek as a bunch of ground moles. Have also fed it to my pigs, and every one on the place has his tail tightly curled and is always ready for his feed."—Samuel Brice, Prop. Walker Stock Yards, Rt. No. 13, Grand Rapids, Michigan.

"SAL-VET did the work. I think it is the best tonic and worm expeller ever. Since feeding it, I have the best bunch of shoats I ever owned. They are larger, seem bigger boned, and are free from worms, although before I fed the remedy, they were infested with worms. I never saw hogs do as well as these." —V. T. Pease, Conway, Iowa.

I'll Feed Your Stock 60 Days at My Risk

In order to prove to you the value of my Great Worm Destroyer and Live Stock Conditioner, I freely make this liberal offer to every farmer and stock raiser, so that all may prove its value. Not only will SAL-VET destroy worms in your farm animals, but it will stimulate the appetite, relieve constipation, and put your hogs, sheep, horses and cattle in condition to better resist dangerous diseases. Thousands of farmers regularly feed SAL-VET to stock for SAFETY; you should not ignore this liberal offer. Here is the **cheapest live stock insurance** you can get.

(209)

Send No Money—Just the Coupon

Just fill out the coupon—tell me how many head of stock you have, and I'll ship you enough SAL-VET to last your stock 60 days—you simply pay freight charges when it arrives and feed it according to directions. If SAL-VET has not done all I claim, and you report results in 60 days, then I'll cancel the charge, and you won't owe me a penny.

500 pounds.....	21.12

No orders filled for less than 40 lbs. on this 60 day trial offer. Never sold by peddlers nor in bulk; only in Trade-Marked SAL-VET packages. Shipments for 60 days' trial are based on 1 lb. of SAL-VET for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular sized packages.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE
MISSOURI FARMER
COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE
AND THE MISSOURI EXPERIMENTAL STATION

To My Boy Friends

I want to talk to the boys in whose homes The Missouri Farmer is a visitor about the liquor habit. Mind you, I am not going to assault the personal views of the readers of this paper on this question—but I am going to say some things which I think ought to meet with the approval of every Father and Mother of a boy in Missouri. I have occasion to travel about over the Country a good deal and the things I see prompt me to have this heart to heart talk with the boys who belong to "The Missouri Fa mer Family." Somehow, there are too many boys who apparently believe that being "tough" is an evidence of manliness. They seem to think that they must sow their crop of "wild oats" ere they can become real men—and a more idiotic or vicious idea has never found root in the brain of youth. When confronted by temptation they too often yield for fear of being branded a "Mother's Boy"—and thus, secretly promising themselves that they will return to the fold of decency after they have had their "fling," they take the plunge—and God only knows what the final outcome is to be.

Of course, if you have made up your mind to tread the primrose path of folly whether or no, perhaps no words of mine can call you back—but there are certain things I want you to understand while your brain is still clear and while there is still time to change your course. In the first place, get it out of your head that you are stronger than this habit—that you will be able to tear yourself loose from its embrace once you make up your mind to that end. Along the pathway of yesterday there lie the pitiful wrecks of legions of strong men who, once upon a time, thought this also but who realized their foolhardiness when it was forever too late—who came to linger and play for only a little while amid chinking glasses and ribald song and laughter but who disappeared forever into a night which knows no sunrise. So have a care my boy—for there are "red lights ahead!".

In the next place, I want you to realize that the great bronze doors which open to the seats of the mighty remain forever barred to the boy or man whose breath smells of liquor. Your friends may consider you a "good fellow"—but the big, solemn faced men who are doing things in the World are not looking for "good fellows." They have no use for a "sport" or a chap who can tell the latest vulgar story. What they want is a boy with a clear eye and a clear head—a boy who is clean in mind and body and who wants to get somewhere—who wants to win! For this kind of a boy the World is literally bristling with opportunity. For this kind of a boy little is impossible—while usefulness and a reasonable degree of happiness are almost certainly assured. And it is today—while you are still unfettered—while there is still time to turn into the safe path that I want you to think over this matter solemnly and soberly. I only wish that every boy who reads these lines could realize what the men who own the big red barns and who direct the big banks, railroads, stores and factories think about this question and the impatience and contempt they feel against those things which ordinarily stand for a "good fellow"—the fellow whom so many boys have imitated to their everlasting sorrow and regret.

Again, some of these days, in all probability, you will ask some sweet girl to become your wife—and she has a right to expect you to come to her with a clean mind and body. She has a right to expect you to have lain the foundation of a manhood which will protect her as much as possible against sorrow in the future—and if there is any real honor in your make-up you won't ask her to take any unusual chances. It is only a coward—and a most despicable one at that—who will gamble with the human lives that are entrusted to his keeping. Then there is your sweet Mother—surely you will avoid these pitfalls for her sake? So, too, your Father wants a son who can take a man's place in the World—who will not bring anguish and sorrow to his gray head as the long shadows of life's final sunset slowly and kindly gather about him. And lastly, there is your Country which has a right to expect you to be every inch a man—for upon the fiber of its manhood depends its prowess as a Nation. That you may take these things home to your soul and conscience and that you will ponder over them with profound solemnity is the ardent hope of your friend,

The Author of After-Thoughts.

SILO A PROFITABLE INVESTMENT

The coming of the silo to the Missouri farmer is making a great revolution in farm life. The riding plow, the steam plow, the automobile and good roads have created a vast change in rural life. Now the silo steps in and offers to do its part by lessening the burden and cutting down the expenses of our friends, Mr. Farmer.

What is a silo and what is it good for? There seem to be the two questions asked by every farmer who is without a silo. A silo, whether it be built of wood, brick, hollow tile or concrete is a storehouse for the preservation of food. Not only does it preserve the ear of corn but the stalk and blades as well, and when you have found a way of saving at least one-fifth of your crop that has been going to waste, you have found a way of cutting down expenses and saving money.

I say you are saving one-fifth of your crop because I believe there is one-fifth as much nutrition in a stalk of corn and its blades if put in a silo as there is in an ear of corn that is thrown in an open crib. [There is a great deal more than one-fifth the feeding value of the grain in the fodder.—Editor.]

The ear of corn that is thrown in an open crib becomes very hard by feeding time. It is thrown into the feed box, broken once or twice and is ready to be eaten. The corn that is taken from the silo is in a soft condition, more easily digested and more relished than the dry hard ear. The stalk and blades if preserved right will be soft and succulent and relished more like grass.

In filling the silo you should see that the fodder is cut very fine and is put up in a damp condition. It would be advisable to keep a small stream of water running into the fan of the machine all the time, even if your fodder is damp. More ensilage is spoiled from the lack of moisture than from most anything else. After the silo has been filled let it settle for a week then refill it, keeping it tramped down good all the time. Then run some straw through your machine covering the ensilage with two or three inches of this fine straw. Wet the straw thoroughly. Or better still, cover ensilage with about two inches of wet oats. The oats will sprout and form a crust thus keeping out the air. Never break this crust until feeding time for every place it is broken will let in the air and as far down as the air goes your ensilage will spoil.

Now as to the different kinds of silos, they are all good but some are better. A great deal depends on the man and his peculiar conditions. Some prefer one kind while some prefer another. Here in my section of the country, Daviess County, the wood silo seems to be preferred and I believe they are as good as any. If they are properly constructed and covered with a good paint they will be practically air tight and will last for many years. The silo did not take very good in this section of the country at first. Everyone seemed to think them too expensive. Being in the farming and banking business as I am and coming in daily contact with the farmer, I have talked the silo from the very first. I asked this question, Why don't you buy a silo? It's too expensive, I can't afford it, was their reply. Then we would argue the case from a financial as well as a time saving standpoint. Today nearly all these men have a silo. Now I ask them this question: How do you like your silo? A smile comes over their face, for they used to argue with me against the silo, but they invariably say, "I wish I had another," or "I am going to have another."

The first expense may seem a little steep for the pocketbook or the expense of filling once a year may seem a little high, but Mr. Farmer, when you look on the other side of the fence and see the time saved, cutting down expenses, preserving your health by keeping you from exposure to the winds, snow and sleet, producing a better bunch of cattle and having them ready for market a few weeks before the usual time and having the satisfaction of knowing that your stock is going to have the same feed next week as today, regardless of the weather, you are bound to think more of owning a silo every time you see one. Build a silo is my advice. If you don't like wood get hollow tile, concrete or something else, but build one of some kind. They are the only safe-guard against the dry weather that has been sweeping this country the past few years.

L. N. Callison,
Daviess County.

SILAGE AND SHREDDED FODDER BOTH GOOD

You ask farmres what they think of the silo? This is our second year with the silo and we would advise the farmer to build and fill a silo and then cut up and shred the corn that is left.

There was quite a lot of fodder shredded here last fall and so far as heard from all are well pleased. They have it in the dry and all waste of both corn and fodder is avoided and the full feed value of the fodder is secured. The shredder knocks off much of the worm dust and the corn is a much safer feed. One farmer remarked, "If you want to find the cattle that are wintering best go to the farm where you see the silo." By feeding silage and shredded fodder you find no feed tramped in the mud. You get the minimum waste and the maximum nutrition from your feed. I appreciate your practical paper, The Missouri Farmer.

H. F. Davis,
Christian County.

Sets Snug With the Ground Over Hill and Dale

FENCING your farm the "Apex Way" gives you the best looking fence that any man could own. Uphill and down dale, the fence fits the land smoothly—every line wire tight—every stay wire standing erect.

It's the "swinging joint" that gives you this big advantage in "Apex Fence." It allows the line wires free play—prevents binding or buckling. Apex Fence is easier to put up—lasts longer and holds its shape better than any other good fence that we know of. It's made of best grade, open hearth steel wire—full gauge, thoroughly galvanized. Write for booklet.

APEX Steel Drive Posts

are made of elastic, carbon angle steel—the strongest and toughest post material known. Drive them into any soil, gravel or soft shale—no post holes to dig—no injury to post. Think of the work they save in a busy season—hauling, handling, setting—save you 8 to 10 cents a post. Burn your fence rows clean—ground the lightning and protect your stock. Nothing is better or more economical than Apex Posts. Do not rot out, break, bend or burn—last for generations.

Write for the "Apex Way" and learn how easily you can save money by fencing your farm the "Apex Way."

Hayes
Four Wheels—Bigger Yields

GOOD seed, rich soil and favorable weather count for little if your corn crop is carelessly planted. Planting is *just as important* as seed, soil and weather. It is the one thing over which you have complete control—the one thing you can regulate to insure a *bigger yield.*

The Hayes Four Wheel is *guaranteed.* It *must* be all we claim and all you expect. 180,000 users verify that **Hayes** Four Wheels regulate depth of planting to the *fraction of an inch.* Corn all comes up at the same time, allows earlier cultivation, an earlier harvest, a *better quality* and *bigger quantity.*

Hayes Four Wheels guarantee *surer germination* and *quicker growth.* Wheels pack the dirt around the corn to hold the moisture and leave a *ridge of loose soil* on top. Ridge over corn prevents washouts in hilly fields and gives greater surface for sun's heat.

Covers where all ordinary open wheels fail—even in wet and sticky ground. Guaranteed not to clog. Short coupled, light draft and turns in shortest space. *Checks with absolute accuracy,* regardless of team's speed. Cross rows straighter than the way you drive.

The **Hayes** Drop *never misses a hill* Simple, reliable and most efficient. Fewer parts, less breakage and delays. Has no clutch to miss and give trouble. *Never cracks or grinds the seed.* Will drop accurately any size or shape kernel. *No bare spots* in **Hayes** planted fields. No replanting necessary. Increased yields soon pay for it.

Thousands in use for years with practically no repair expense and every one giving *time-saving, money-making* service. No complicated parts to get out of fix. Strong construction, *practically exempt from breakage.* No expensive and aggravating delays in the busy planting season. Easy and simple to operate and can be trusted to unskilled help.

Can be furnished with perfect working Fertilizer or Cow Pea Attachments, Stub Runners or Disks.

2000 dealers. Ask your dealer or let us prove how this planter prevents corn field waste and increases corn yields. Don't make a mistake. Buy the planter that *guarantees* results.

Free book AP of Planter Facts tells all about the **Hayes.** Write for it today—a postal, or if you wish a letter, asking any questions on planting problems.

HAYES PUMP & PLANTER CO., Galva, Ill.

The Fence That STANDS Tight and Trim The Whole Year Round

—and Why (15)

Every farmer knows that a fence which will stay tight and trim through summer and winter must be built to give and take. It must be made of tough, springy wire, and in such a way that in contracting and expanding it will take up as much as it gives out.

There are several reasons why

"Square Deal" Fence
Stays Tight and Trim the Year 'Round

FIRST: Note that the strand wires are wavy. This gives the fence ***elasticity***—its give and take—***keeps it tight*** summer and winter.

SECOND: The Stay Wires are ***one-piece*** from the top wire to bottom one, forming the backbone of the fence, which stiffen and support it, absolutely preventing sagging and bagging.

THIRD: Note the ***SQUARE DEAL LOCK*** which double-grips the wires so tightly they cannot possibly slip. It is one of the most important parts of a wire fence.

We use the toughest, strongest wire—draw it, anneal it, galvanize it in our own mills; then weave it into Square Deal Fence. We know how it is made—the kind of material that's in it—stand back of it with our Square Deal Guarantee, which insures every purchaser a Square Deal and perfect satisfaction.

FREE—Write for Catalog, Prices and Ropp's Lightning Calculator

We want land owners to know more about this "honor built" fence. Our catalog tells the story. If you will write for a copy we will send you FREE, a regular 50c copy of Ropp's New Lightning Calculator (if you have not sent for one before)—the greatest money, time and labor-saving book for farmers ever published.

Takes Too Much of Our Crops to Pay the Interest.

By Geo. B. Ellis, Managing Editor

A number of our ablest and closest thinking farmers agree that it takes too large a part of what we produce on the farm to pay the interest on what we owe. As we have previously stated in these columns a very large part of the business of farmers is done on borrowed capital. Assuming that the amount of debt carried by the farmers of the United States is correctly estimated at five billion dollars by the department of agriculture it will take in the average year all the farm surplus of our great wheat crop and a large share of the oat crop to pay the interest alone on our annual farm debt. Take for illustration the wheat crop of 1914, by far the largest crop ever produced in this country. We produced last year 891,017,000 bushels of wheat and if we allow for the farmers' own bread and seed for a year there would be a surplus over and above farm needs of approximately 550,000,000 bushels. Before the European War broke out last August farmers were selling their wheat for 70 cents a bushel or less and at that price the farm surplus of the whole wheat crop would fail by two and a half million dollars to meet this interest payment. But last year's wheat crop was 163,000,000 bushels above our average yield and hence we say it has not only taken the whole of the surplus wheat above the farmers' needs for seed and bread but it has taken a large part of the oat crop to make up the deficiency. It is not strange then that practical farmers like Mat W. Hall of Saline County, J. S. Bedford of Boone County and W. C. Brown of Iowa will declare as they have done in this number of The Missouri Farmer, that "high interest rates and short time loans are the greatest handicaps to profitable farming."

Three Systems in Europe

There are at least three systems of making long time farm loans in various foreign countries that have proven better than our system in this country of allowing this important line of business to be controlled by private interests. Under any and all of these systems the European farmer borrows money to buy land, to purchase needed live stock, to drain or otherwise improve his land and for other necessary purposes at from one-half to two-thirds what the Missouri farmer is compelled to pay. The first of these is the co-operative system. Under this plan the farmers of Germany, Denmark and other countries have been getting cheap money for many years. This plan seems to be very well suited to a populous country where a sufficient number of farmers are found in a small district to form a loan district. In such a district the farmers have opportunity to know all the members personally and there is little chance for dishonest men to get in or if they happen to get in they are soon found out and can be expelled. This makes it possible to maintain these associations with unlimited liability of every member but without loss to any. The individual farmer when he mortgages his land to secure his loan at the same time becomes security for every other loan in the association. This is the feature usually objected to in this country and yet it is the necessary feature in this plan that enables farmers to get cheap money. The security back of these loans is so absolutely safe that the bonds of these associations sell for about the same rate of interest as Government bonds. While the farmer is liable for every other borrower he in turn is secured by every other borrower and the practical working of this plan has shown that there is no loss. However it is not considered that on account of our sparser population and because our lands have not yet the stable value they have in older countries that this is the best plan for us to adopt.

Direct Government Loans

Another plan that has been suggested for this country and which has also been successfully operated in other countries is the direct government loan. Under this plan the Government makes the loan direct to the individual farmer and takes a mortgage on his land for security. This is the plan that has revolutionized the land tenure of Ireland. Irish landlordism has been the greatest blot on English civilization. But this system of government loans and compulsory sale of the land will in a few years give Ireland a well distributed land ownership. In 1911 there were 535,675 agricultural holdings in Ireland and up to March, 1913, applications had been made for the appraisement of 455,000 which is more than 80 per cent of the total. Up to that time 240,000 had taken out loans and become land owners. The farmers of Ireland are very poor and have no money to make even a small first payment on the land but in this instance the Government takes the whole risk. This necessitated of course large capital and the Government of Great Britain has already furnished over $600,000,000 of capital for this purpose which is estimated to be not more than 60 per cent of what will eventually be required. Under this plan the tenant who buys land gets the loan from the Government for 68½ years and at only 3½ per cent annually for interest and amortization. As an example if a tenant buys a holding for say, $5,000, he will be required to pay 3½ per cent yearly $(175) for 68½ years when the debt will be completely wiped out and he will own the land free. Some plan like this was necessary in Ireland where 80 per cent of the population are tillers of the soil but only a very few owned the land they tilled. The tenants were too poor to make a first payment on the land, however small, and some plan had to be devised that would enable them to pay a small amount out of their yearly crop returns.

The Missouri Plan

A third plan which may be said to be a compromise of the two plans outlined above is now before the Missouri Legislature and we think with proper safeguards will meet the present demand in this state for cheaper and longer time farm loans. In this plan the state will furnish the working capital necessary to get the business started and furthermore the state will furnish the necessary supervision and administration to insure the successful working of the law. But the state will be repaid for all it puts into the business out of the profits as they accumulate.

The governing board of this proposed Missouri Land Bank as it will be known as now proposed will rest with the Governor, Attorney General, Treasurer and Auditor, and the executive or supervisor will be the State Bank Commissioner. Thus it will be seen that without creating a single new office we will have the business managed by five elective state officers. In the administration of this law the state will be divided into districts and a land appraiser will be appointed for each district. In the bill now before the Legislature it is proposed to pay these appraisers a salary of $2000 a year. It will be important that these men shall be good business men and well acquainted with land values. If the land is honestly and fairly appraised and the title is perfect there will be scarcely a possibility of a loss.

A Million Dollars Capital

The working capital for this Land Bank (more correctly loan agency and not a bank at all) is to be provided by a state loan of $1,000,000. Against this capital and the farm mortgages taken to secure loans debenture bonds will be issued and sold. Right here is where the great advantage can be given the borrower over the present system. By reason of the guarantee of the State of Missouri these bonds can be sold at possibly 4 per cent interest and when to that rate there is added a small fraction for expenses, another small fraction for creating a reserve and to repay the state for the capital advanced the interest rate charged the farmer would not exceed 5 per cent and more probably less than 5 per cent. Such a plan of course should provide the payment of an additional amount annually to pay off the debt and the whole annual payment need not be more than the rate most farmers are now paying to insurance and other eastern loan agencies for interest and commission. Thus in twenty-five or thirty years the farmer finds himself free from debt. If the farmer is prosperous and finds that after five years he can pay all or part of the principal he will have the right to do so.

Under our present system most farm loans are made for five years only and few men expect to pay them off in that time. There is always a certain amount of uncertainty about the chance to renew the loan and often the farmer has been compelled to sacrifice breeding stock in order to pay part of the loan, when it would have been much more profitable to have kept it on the farm.

As the proposition now stands before the Legislature loans will be made to farmers on promissory notes secured by deeds of trust, time running from five to twenty-five years and in amounts from $250 to $10,000 and never for more than fifty per cent of the appraised value of the land. Thus it will be seen when the state is secured against every dollar that is loaned by two dollars in land value there is not the remotest possibility of any loss ever falling on the state. Furthermore, every year these loans run by reason of the amortization plan there will be more than double security.

Bankers Should Favor This Plan

Some have contended that lower rates of interest would encourage land speculation but that is provided against in this measure to a certain degree by providing that loans may be made solely for productive purposes and in limiting loans to $10,000. The bill provides that loans shall be made only for: (a) To increase the productiveness of the land mortgaged; (b) to make useful improvements; (c) pay off encumbrances or part payment on farm; (d) one-fourth of the loan may be used to buy live stock or machinery. In time, no doubt, it will be found advisable to limit loans strictly to those who occupy and cultivate the land, but under the above restrictions it will from the start be practically so restricted.

No one should be found to oppose this plan except the brokers and loan agents who have fattened at the expense of the improvement of the whole country. Bankers as a rule should be found favoring this proposition because it does not in any way interfere with legitimate banking business and because anything that will tend to the general prosperity of farmers will indirectly be helpful to bankers in the increased amount of business done.

For the farmer who has money to loan these bonds will furnish him a safe investment. For widows and orphans these bonds will furnish one of the safest and most satisfactory investments they can find . If these bonds are exempt from taxation which they should be, they would be much sought after even at as low a rate as 4 per cent and would keep thousands of dollars within the state that now go to other states to escape taxation.

The question for Missouri farmers to determine is "Shall we go along in the same old rut, paying interest above the profits of our farms or shall we profit by the experiences of Great Britain, Germany, France, Denmark, Austria, Australia, New Zealand and other countries and thereby build up in this country a system of land ownership instead of land tenantry?" The result is in the farmers' own hands. The country is ready for the change and the Legislature is ready to act if the farmers demand it.

CORN SILAGE FOR BEEF CATTLE

With prices of coarse grains higher than they have been in years the problem of fattening and wintering cattle economically in the corn belt never has been more complex. The higher values mean that little differences in feed and care show a wider range of profit or loss in the balance sheet than when figures were smaller. New practices in feeding have been investigated by Agricultural Experiment Stations, and tried by feeders. Among the most distinct economies which have been widely accepted are the use of corn silage and high protein concentrates in rations for beef cattle. It is a consideration of the former to which I wish to call your attention at this time.

A proper understanding of the position of silage among other feeds and its limitations are of first importance. If one were to compare it with other feeds they would find it most nearly resembled shock corn. Yet comparative tests have shown that an acre of corn converted into silage will yield from 30 to 50 per cent more than a similar acre in the form of shock corn. The silage is more digestible and on the average undergoes less loss in the siloing process than shock corn does, due to weathering. It is probably more difficult in utilizable protein but generally speaking it is more comparable to shock corn than to any other feed. Silage varies widely in its nutritive value due largely to the wide variation in the corn from which it is made. A good grade of silage will contain from sixty to sixty-five percent of moisture. More moisture means less nutritive value per ton. It also means that the chemical change has gone too far and very acid silage is the result. This may be caused either by cutting the corn before it is sufficiently mature or by the addition of too much water at the time the silo is filled. A good grade of silage contains about five bushels of grain per ton. With more or less grain the feeding value is increased or decreased accordingly.

It must be recognized that corn silage is not a complete feed in itself. Failure to realize this fact has resulted in poor returns and criticism of its use. Its most conspicuous deficiency is its lack of sufficient pure protein. This deficiency should be made up by feeding with it some feed which is high in protein.

For wintering stock one of the legume hays, such as alfalfa, clover or cowpeas, is the best supplement to silage. Five pounds per 1000 pounds live weight of such hay when fed in connection with silage makes an ideal ration for wintering cattle. Where such hay is not available a nitrogenous concentrate should be used. For this purpose cottonseed cake or meal, or old process linseed oil meal have proven to be very satisfactory. At least one pound of the cake or meal should be fed daily per thousand pounds live weight. Where the concentate is used instead of a legume hay, a small quantity of some dry roughage should be fed in addition. Oat straw or a good grade of wheat straw will satisfy this need. When cattle are to be grazed during the summer without grain it is best not to feed so much during the wintering period that they will be too fleshy to graze will when turned to pasture. The quality of the silage used and condition of the cattle should enable the feeder to judge the amount to feed.

The proper use of silage in rations for fattening cattle is undoubtedly a distinct step in advance of old methods. Here again it is important that its limitations be considered. First of all it is necessary to supply the deficiency in protein. For fattening cattle the use of a nitrogenous concentrate such as the cottonseed products or old process linseed oil meal, is generally best.

The quantity which may be fed to advantage will vary somewhat depending upon the relative price of the various feeds available. As a rule, however, it is best to feed at least two pounds per 1000 pounds live weight. This quantity may be increased to five or six pounds per 1000 pounds live weight in case cottonseed cake or meal is used for a short feeding period. The advisability of feeding a large quantity of such concentrates depends to a large extent upon its price in comparison with corn and other grains. After the protein requirement in the ration is satisfied the value per pound of an increased quantity rapidly decreases.

Some beginners with the use of silage in fattening cattle have made the mistake of considering it unnecessary to feed grain in addition. The use of silage will reduce the necessary amount of grain needed for fattening cattle, and for two-year-old or older cattle which are in thin condition very satisfactory gains may be made for sixty to ninety days with no other grain than the high protein concentrate. Cattle which are to be finished in July by feeding grain and pasture may be very economically started in this way. Without the addition of grain rapid gains in live weight and a high finish cannot be expected.

In addition to the grain supplement to silage for fattening cattle it is desirable to feed some dry roughage. The quantity consumed will be small and is generally not over three pounds per head daily for two-year-old steers when the best grade of clover or alfalfa hay is used. The high nutritive value of these hays makes them desirable for this purpose, however, a good grade of straw will do when hay is not available. The use of a dry roughage in addition to silage causes the cattle to feed more uniformly and they will also continue to do well for a longer feeding period.

The Missouri Experiment Station made this statement about the above bunch of cattle when they were ready for market: "A superior finish is obtained on fattening cattle which are marketed in the spring when silage composes part of the ration."

In feeding any class of live stock great care should be used to avoid the use of mouldy silage. There are several molds commonly found in silage, some of which are poisonous and others do not seem to be harmful. Generally those which are red or green in color are most likely to cause bad digestive troubles. Our present knowledge is not sufficient to enable us to tell definitely the unharmful from the harmful molds. The only safe practice is to avoid feeding the moldy silage.

The use of corn silage in the economical production of beef cattle is a more important factor this winter than ever before. It promises to continue to be a very important consideration and when properly used in connection with other feeds will considerably reduce the cost of dry lot feeding.

H. O. Allison,
Missouri Experiment Station.

This Plow Protects Your Crops Against Droughts

because it picks up *all* the furrow slice, turns it *clear over* and *lays it flat on the subsoil.* No crop-killing air spaces are left this way, to cut off moisture from below. This means *real drought protection.* Air spaces have killed many a crop, but they won't kill yours if you use the

Rock Island "CTX" Universal Plow

On account of its peculiar, auger-like twist, the "CTX" bottom can go into stubble, tame sod, trashy corn ground, heavy clay, gumbo, etc., turning the slice clear over and completely burying all trash.

No extra bottoms needed with a "CTX." Soil pulverized so thoroughly that one extra harrowing is saved.

Write for free book now.

A new "CTX" booklet has just been written, that shows why we can make such strong claims and why so many farmers are proving, by careful tests, that the "CTX" is increasing their yields from 2 to 10 bushels per acre. *Write for this free book today. Address*

Rock Island, Ill.

SOME HANDICAPS TO MONEY MAKING ON THE FARM

Dear Editor: With regard to your question, "Why Does Not the Average Farmer Make Money?" I would first call attention to the fact that comparatively few men in any business or profession are "money makers." To be explicit, the income of the average man, whatever his occupation, does not greatly exceed his expenditures. In this sense I suppose there are as many "money makers" among farmers in proportion to their number as there are in the other walks of life.

As I see it, however, the greatest handicap to the average farmer's business success is the lack of working capital. There are many opportunities for a farmer to make money if he had the capital to invest as these opportunities arise. Not having it, he hesitates to borrow, lest the high rate of interest should eat up the profit on the investment. Cheap money—long time loans at a low rate of interest—would do more for agriculture in this country than any other one thing, I believe.

Then again, a great many of our farmers are renters, and their ability to borrow is, of course, limited. The renter is generally handicapped by the fact that the farm he rents is poorly fenced and inadequately watered, and he is thereby forced to follow a system of grain farming alone. He plants, harvests, and sells his wheat and corn, and is practically idle one-third of the year and begins next spring just where he began last. Farming is a continuous, all-the-year-round job, and requires study and close attention to detail. We must constantly conserve soil fertility by crop rotation and the raising and feeding of all kinds of stock, which last, of course, necessitates good tight fences.

After all, when the farmer has met all the requirements that confront the average man in any other business, there are many other forces with which he must contend. Even "the stars in their courses" seem to fight against him at times, and the wet weather, the drouth, the army worm, the chinch bug, the codling moth, the corn worm, the potato beetle and the cabbage worm—thousands of destructive insects which are left to prey on vegetation by the wholesale slaughter of our game and song birds—are some of the destructive forces eating into his profits.

Then, possibly, just as the farmer feels that he has conquered all of the above mentioned pests, along comes the advocate of the simultaneous treatment for hog cholera and infects all the innocent and unsuspecting neighborhood. My observation in this county warrants the statement that, wherever the simultaneous treatment has been given, it has been followed by a bad out-break of cholera in that community. There can be no doubt in the mind of any reasonable observer that the man who uses the simultaneous treatment ought to quarantine closely in order to confine the disease to his own pemises and not destroy his neighbor's hogs. Another cause of infection in this dreaded disease is the deplorable practice which some men have of shipping all their hogs, both sick and well, when outbreaks occur on their farms. The sick herds are driven along the public highway to the nearest shipping point, thus scattering the disease far and wide. It occurs to me that it would be well for the state and nation to handle hog cholera as it does foot and mouth disease in cattle.

Again, labor is scarce and high, and machinery must, to a great extent, take its place; this necessitates a more costly equipment for farming than was ever before necessary and the up-keep of this equipment is so expensive that it makes a big hole in profits.

The average farmer in Missouri must have his silos, deep wells, wind mills, gasoline engines, tractors, motor trucks, automobiles, and it requires an astute business brain to figure profits on such a large investment.

To the average city man, farming is "the simple life," and requires only "simple minds" to reap its rewards. Nothing could be farther from the truth, since to meet present day conditions, the farmer must be, not only a tiller of the soil, but the master of several trades, and must have a speaking acquaintance with several of the learned professions. He must be a good carpenter and concrete mixer, a good mechanic, machinist and blacksmith; he must have a smattering of chemistry and be a fair veterinarian; in addition, he must have the patience of Job and the courage and business ability to wring success from seeming defeat, else he will never be a "money maker" in the sense in which you use that term. Matt. W. Hall,

Saline County.

THREE YEARS' EXPERIENCE WITH SILAGE

I am certainly glad tof the opportunity to give my experience to the readers of The Missouri Farmer, in silage feeding and silo building. We have been feeding silage for three years to horses, including brood mares and mules, to cattle and sheep, with excellent results. After using a silo one season, almost any farmer would quit the business of stock raising if forced to do without one. Our horses and mules receive nothing through the winter except silage and thrashed hay and are in excellent shape.

We never give our horses or sheep any mouldy or damaged silage and to this we attribute our success. Whenever I hear of any bad results I always find that mouldy silage has been fed. We are not so particular with our cattle, and mix the damaged silage a little at a time thoroughly with the good. This may not be a good practice, but we have never had any bad results. Our stock hogs which follow our cattle fed on silage alone, never receive any corn.

We have found that the older the cattle are, the faster they will put on flesh. Calves do fine, but require corn and some concentrates in addition, to putting on flesh to finish them.

As to our silo building, we have erected two kinds. Our first venture was a wooden silo. It was built of two by four cypress, tongued and grooved and turned on edge. This silo has seven sides and is equal to a 17x 32 round silo. This was built at a cost of $210, including our own labor. Actual money paid out was nothing like that much. I do not consider this silo a success, for we found that it had to be lined with rubberoid to make perfect ensilage. I would not advise anyone to build this kind of a silo, although I prefer it to a stave silo.

Our next venture was a concrete, and this I consider the best kind. It is the height of folly for any man living close to gravel to erect a wooden silo. If farmers only knew that they could build permanent silos cheaper than wooden ones, there would never be a wooden one erected. During a wind storm last summer over twelve stave silos blew down around our town. Two of our neighbors have discarded their stave silos and have erected concrete ones. Our silo was built with a three-foot home made form. Size of silo was 20x46. All the concrete was mixed by hand, as we built only 31 inches per day. We could have built four feet on a smaller diameter. We used the very heaviest reinforcement for first 30 feet. I would never advise fencing wire for reinforcement, especially on a large diameter. A six inch wall, good reinforcement and the concrete well puddled, makes a silo that cannot be beaten.

This silo was built by myself and two men I had hired by the month. We had an experienced man in concrete work to help make the form and to build first twenty feet. The actual cost of this silo, including our own labor, hauling of gravel and cement, was something over $400—not very much. The actual money we paid out was about $200, counting all labor except myself and teams. This silo has been filled for the last two seasons, and the silage has kept fine. I advise any man who understands mixing concrete to build his own concrete silo. Do not be afraid of getting them too high. The higher the better, up to sixty feet. Most of the men around our town are having them built by a man who follows the business. He puts up a fine silo, but any farmer with a little nerve can build his own much cheaper. I think it would be a great thing for the farmers of this state if the home made forms could be shown to them at the town and county fairs. Wisconsin has accomplished a great deal in this line, and there are hundreds of home made concrete silos over the state.

Lewis Bell, Monroe County.

THE GURLER SILO

There is considerable interest in this section in the home-made (Gurler) silo. I have built and now have in use one such silo and in the hope that a few suggestions may be of value to my fellow farmers, I offer this article. The foundation is made of solid concrete; the wall is 8 inches thick, 3 feet in the ground and 1 foot above ground. The cement is mixed as follows: cement one part, gravel four parts and sand two parts. Size of silo when completed is 18x40 feet. Put in the concrete while yet soft; 2x4 pieces cut 18 inches long with a miter that will make a circle 18 feet in diameter. Put three 60d spikes in these 2x4's 2 inches from the end and crook the end of spike, then sink 2x4 into the cement to the top of the 2x4.

To this foundation spike the 2x4 (rough lumber) uprights over each joint in the foundation, then plumb to a solid, but temporary center pole. After 2x4 uprights are in place a lining of rough lumber one-half inch thick by 4 or 6 inches wide is put on the inside bending to the shape of silo and firmly nailed to the uprights. Then on the outside of the upright, common house weather boarding with ¼x½ inch groove, cut on inside of thick edge, then bending to shape of silo with ½-inch lap and firmly nailed to the upright.

Then on inside with common lath (running around) nailed to lining with ¼-in space, plaster with a mixture composed of 1 part cement to 3 parts sand; put on two coats of this mixture so it may be ½-inch thick when completed and a slush coat of pure cement to finish. The practical workman will easily understand that he must commence at the ground to put on the weatherboard, lining and lathes, scaffold up and repeat to the top, then beginning at the top plaster and take out the scaffolding as he comes down. The door is continuous from ground to top. At each side of opening two 2x4 pieces are spiked together. Against this inside face of 2x4's doors are placed as the silo is filled. Doors are made of flooring boards two thicknesses cut in length of door. The door opening is about 21 inches. The outside boards are crosswise of the opening and the inner boards lengthwise of the opening.

Across the door way at intervals of about 27 inches are placed 4x4's cut 20 inches long to hold the door jambs apart,and beneath these 4x4 door jambs are run ½-inch rods 29 inches long, firmly bolted to hold the door opening. These 4x4 pieces are held in place by spiking through the 2x4 door jambs.

Such a silo can be built for from $175 to $250 according to location; this includes all lumber, lath, cement and labor, and it holds 210 tons. I believe this home-made silo will keep the feed as well and last longer than any of the other various types of wooden silos and at a very small comparative cost.

Fred F. Kaser, Baring, Mo.

INSURE YOUR SEED

Get a "catch", a good stand, and a big yield of CLOVER, ALFALFA, Peas, Beans, Vetch, and *all other Legumes*—inoculate with

SIMULTANEOUS OR SERUM-VIRUS METHOD

(Continued from last issue)

The "simultaneous method" called also "serum-virus" method differs from the single or serum alone method only in this, that a dose of "hog cholera virus" (that is diseased blood from a hog suffering from an acute attack of cholera) is injected at the same time the protective anti-hog-cholera serum is injected. If this "virus" were used without the protective serum it would produce in most instances a fatal case of hog cholera, but the protective properties of the serum which is injected at the same time modifies the severity of the action of the cholera germs that are injected. The presence and multiplication of the disease germs which have been injected into the hog produces some degree of illness, in some cases it may be so slight as to escape casual notice, and can be detected only by using a clinical thermometer, and showing the presence of fever. In some animals evident signs of illness may be observed, as loss of appetite and high temperature, some may become seriously ill, and some may die. The degree of illness and the percentage of death losses produced in healthy hogs vaccinated by the simultaneous method varies greatly. It depends on several factors, the potency of the protective serum, the degree of virulence of the hog cholera virus and the resistance of the hog vaccinated, as all these factors are in themselves quite variable and not measurable to any fine degree of accuracy, and the results of the vaccination cannot be accurately predicted. Published reports show that in some herds no losses occur from the vaccination, in others the losses may not be greater than a half to one per cent, but it sometimes causes a loss of five to ten per cent and occasionally the loss may run 25% or even 50%, in individual herds. In healthy herds where no losses occur from the vaccination and where no illness is evident the probability is that the "virus" used is weak, and has lost its disease producing powers, and that a durable immunity is not produced in many of the animals vaccinated. Sometimes the virus is killed by the addition of too much preservative, carbolic acid. In those herds which show a well marked illness the probability is that a greater number of the vaccinated hogs will acquire a lasting immunity, just as they do when they have the disease in a natural outbreak. Hogs may also acquire a lasting immunity if they are kept continuously for a considerable time on badly infected grounds after vaccination.

In practical field work the simultaneous method does not produce with certainty a lasting or "life immunity," according to the observations of Dr. Fischer, State Veterinarian of Ohio, who has done more "simultaneous" vaccination in official work than any other veterinarian in the country. His table showing duration of the immunity from "simultaneous" or serum-virus vaccination is interesting in view of the repeated assertions of commercial serum producers that the method makes hogs "immune for life," an error into which some official veterinarians of this and other states have fallen, as well as many private practitioners. Such an error is in most cases due to lack of experience. Dr. Fischer's table is as follows:

Duration of Immunity, from "Simultaneous" or Serum Virus Vaccination: Pigs 1 day to 6 weeks of age, are immune 2 to 3 months; shotes 2 to 4 months of age are immune 6 to 8 months; older animals are immune one year.

He further says, "Remember that this table indicates "approximate" time only and that **immunity sometimes runs out unexpectedly."** But, "as a rule the time given in the table will be a reliable guide to determine the proper time for **retreatment."** He further recommends that: "Thereafter, all adult breeding animals should be treated annually." In another sentence, in speaking of herds that have been vaccinated by the "serum-virus" method, the following caution is given: "Always bear in mind that the immunity may for some reason run out before the "scheduled time". "And be on the alert for the first symptoms of cholera and apply serum promptly;" that is **revaccinate.**

These statements from the State Veterinarian of Ohio, who has been a strong champion of the "simultaneous method", and has had larger experience with that method than any other veterinarian in official state work, should be good evidence of the unreliability of the method in conferring a permanent or life immunity.

Serum and Sanitation Both Important.

The question is, does the somewhat longer "immunity" that this method gives, compensate for the great disadvantages connected with the method?

The greatest objection to the method is that where it is in general use no progress is made in getting a neighborhood or county free from the disease. Sanitary officers, who by this method save a large number of hogs in a county mistakenly imagine that they are eradicating cholera. Their reports of large numbers of hogs saved and large quantities of serum used, are exploited as evidence that great progress in the control and eradication of hog cholera is being made by simultaneous vaccination. These reports contain scarcely a word about sanitation. Later events show that they have been mistaken in their conclusions; and instead of getting rid of the disease, they have in fact been sowing the seeds of disease on farms where it did not exist before, and have thereby increased the area of infection; and made the hog cholera situation worse than it was in the beginning. Abundant evidence that this is true can be had from counties in Missouri where private practitioners, and the agents of commercial serum companies, have exploited the serum and virus treatment and have used what the farmers believed was "good serum" and "good virus" because it was prepared under "Federal License". It may be claimed that the bad results with virus are due to lack of proper official veterinary control of the field work. But I am confident that the difficulties are inherent in the method, and that " exclusive" official use by graduate deputies or trained experts will not prevent the spead of cholera wherever this method is extensively used. If the plan would work, I am quite sure that Dr. Fischer, the State Veterinarian of Ohio, could make it work, but when a plan is inherently wrong the most able man cannot succeed with it, as is indicated by the following letter from a prominent farmer who lives in an Ohio County where the State Veterinarian has been trying to eradicate cholera by this method, and moreover has full police authority and has charge of the manufacture of the serum and virus that is used. The letter reads as follows: "Dr Connaway: My dear Sir, About a year ago the Ohio Agricultural Commission authorized our State Veterinarian to expend twenty thousand dollars ($20,000) in Fayette County to try out a system to eradicate hog cholera. And in pursuance of that authority he early last spring quarantined the whole county, and began a systematic treatment called, I believe, "simultaneous" method of vaccination; and the results thus far seem to be that we have at this time in the county **more** hog disease than ever known before"; "I have an intimation that veterinarians are not agreed as to the propriety of this method; now I am a hog-raiser and feeder, and would not oppose any method that will tend to lessen the losses from this disease, but if we are accepting a method that will eventually more firmly fasten the disease upon us we ought to be advised; in view of your experience in this matter would you kindly give me some light" (signed Reuben Rankin, Hedgewood Farm, Parrot, Fayette County, Ohio). I have written Mr. Rankin that in one Missouri County that was badly infected with hog cholera in the fall of 1913 whe have so effectually controlled the disease by our method of "simultaneous sanitation" and "serum alone" that we have not had occasion to send to that county any great amount of serum within the last six months. Less than $300 would cover the bill. On the other hand the cholera is prevalent in adjoining counties where our plan has not yet been put into operation. The same plan has been tried out for over a year in three counties, Johnson, Dade, and Cape Girardeau; and the farmers could not be induced to go back to the virus treatment again. Two other counties,

SEED CORN As usual I have on hand a lot of fine selected pure bred seed corn including the following varieties: Yellow corn—Reid's Yellow Dent, Shenandoah and Gold Mine Mixed, Funk's 90 Day Corn, also White Cap 90 Day Corn. White corn—Boone County White, Johnson County, St. Charles, Iowa Silver Mine and Davenport and Boone County Mixed or Crossed. Prices per bushel butted and tipped by hand, graded over our screens and strictly tested, $2.40 per bushel; in 10 bushel lots, $2.30. These prices are F. O. B. Skidmore. The same corn shelled, butted and tipped by hand but ungraded, at $2.00 per bu.; 10 bushels or more $1.90 per bu. F. O. B. Skidmore. Sacks free. I have been in the seed corn business for years and have given hundreds of farmers a start in pure bred seed. Get in your orders at once because my supply will not last long.

The Chinese Woolflower

The three most popular garden flowers the world over were all named and introduced by us within the past 20 years (the Golden Glow, Hybrid Cosmos and Gladiolus Childsi America) a record without a parallel. This year we add to the trio another novelty equally unique, equally valuable and of surpassing brilliancy. It will find its way over the world as quickly as the others did and take its place everywhere as the foremost garden annual.

The Chinese Woolflower is a Celosia of new form and easy growth, two feet high with a score of branches each crowned with a great crimson ball of wooly substance which holds its color and beauty all through the season making it the most interesting, novel and showy of all garden or pot annuals.

Price **20 cts. per pkt.** of 40 to 50 seeds; **3 pkts, for 50 cts.**, together with New BLUE PETUNIA and GIANT SUMMER COSMOS free for trial and Catalog.

Our **Big Catalogue** of Flower and Veg: Seeds, Bulbs, Plants and rare new Fruits *free* to all who apply. We are the largest growers in the world of Gladiolus, Cannas, Dahlias, Lilies, Iris, etc., and our stocks are best and cheapest.

Cass and Bates, which have been suffering from the scourge of cholera and "simultaneous" vaccination have sought relief, and we have organized these counties for work in cooperative sanitation and the results are pleasing to the swine growers of these counties. Other counties are preparing to take up the plan, and we will give them proper aid whenever they are ready. It did not cost the state "twenty thousand dollars" per county to do the work mentioned; nor as much as one thousand in salaries and expenses, for we have put the farmers themselves on the important end of the job, that of "simultaneous sanitation". They are becoming efficient sanitarians, and under our plan they constitute a voluntary sanitary force that does not cost the state a cent, moreover they are always on the job, for the job is on their farms. They do not lie down on the job because the state does not pay them for the work; they even pay for all the materials used;—serum when it is needed, and the necessary disinfectants; and they are finding that the method is economical and effective. The serum bills are growing smaller, and the hog pens are filling up, and the word "virus" is becoming very unpopular in these counties where our simple common sense methods have been adopted.

In my next article I shall go fully into the practical details of the method.

THE AUTO-OILED WINDMILL WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. Two quarts of oil in the gear case of this 8-foot auto-oiled windmill will keep the gears and every bearing flooded with oil for a year or more.

The galvanized steel helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The mill needs oiling but once a year.

There is a windmill, known the world over as "the windmill which runs when all others stand still." This new windmill with gears and bearings flooded with oil runs in much less wind than that well known windmill.

The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The auto-oiled windmill, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable. Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof. There is no friction on any part of the furling device when the mill is running and very little when the wheel is furled.

A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service. A band brake, of the automobile type, is used, and it always holds.

The gear case contains two pairs of gears and the supply of oil. From this gear case the oil circulates to every bearing in a constant stream. It flows out through the friction washers in the hub of the wheel and is automatically returned to the gear case. Not a drop of oil can escape. It is used over and over. So long as there is any oil in the gear case the gears and every bearing will be flooded with oil.

If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Running water purifies itself—stagnant water, standing water, collects and retains impurities. If you pump from your well constantly all the water it can spare, the water that comes in to take its place will be pure. If the water in your well stands until you happen to want some, and you pump but little, then it is likely that surface water will flow into it and carry in impurities. The unsafe well is the one that has standing water. A flowing stream is the thing to be desired.

The auto-oiled windmill makes all this possible as it can run from one year's end to the other with practically no wear and no cost. If interested, write Aermotor Co., 1146 So. Campbell Ave., Chicago. Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. Water costs nothing. Use it. To let it stand is to abuse it.

We need and must have the best dealers everywhere. They need us if they are going to remain in the windmill business. Write right now.

A pull of 30 lbs. on this wire furls the mill.

SOME REFLECTIONS FROM EXPERIENCE

To succeed with live stock on the farm a man must learn to judge stock. Pedigrees don't always count. A good way to learn is to attend the fairs and when the ribbons are tied, get permission to examine the winners; study all the points carefully, try to fix them in your mind and then go off a while and try to make a mental picture of that animal. Then come back and see if your picture is right. Continue to do this until you can see that animal clearly in the mind.

It is necessary that you love your business, love your land for its beauty as well as for its profits. If you don't love the little pigs, calves and lambs and are not willing to do the drudgery necessary to care for them properly your death loss will take all your profits. To love land means that you will keep it fertile, keep it from washing into gullies, protect it from erosion by growing more grass and by sowing wheat or rye in your corn every fall. And also by covering it with all the manure you can make. Young man, if you don't love farming take some other occupation. You will more likely succeed. I am disgusted with this back to the farm agitation by the city papers and the city people. They figure great profits from a business they know nothing about and which are false. There are no big fortunes made by farmers. Only one man in all this great state has made as much as a million dollars. Therefore I say, if you don't love farming don't take up that business. There are thousands living on farms and are called farmers that ought to quit and hire to some good farmer or take up some other business. If you want to stand around on the city streets, dressed in fine cloths, take a city job. But if you have thoroughly decided to farm, think out a definite plan and follow it to the end. Don't plan more than you can do well, reserving enough time to look afte your stock at least twice every day. An old sow is kept through the winter at considerable expense for one special purpose, to raise a litter of pigs, and often she fails to do so because she was not housed and bedded properly. The owner knows that was the reason, and yet he will stand around and cuss his luck. Sometimes half of a herd of hogs are sick with cholera before the owner discovers it. Too late he rushes to give them the serum treatment and because they die he cusses the serum and says it is all a farce.

I don't want to be understood as encouraging idleness, and yet I believe every farmer ought to go to his home town as many Saturdays as he can spare from his business. Not to loaf, but to discuss farming and stock and prices, and for swapping of ideas and jokes, and for recreation.

One of the greatest drawbacks to farming is high interest. We pay interest on too much property that is used only a small part of the year and we pay interest too long before we get a return. For instance, the money to raise a wheat crop draws interest nearly or quite a year before we sell the crop. Suppose you want to grow a herd of cows for breeding purposes and decide to start with heifer calves. The purchase money is tied up 18 months before they are old enough to breed and 15 more before your calves are old enough to wean and sell. Banks don't take these long loans. The same figuring applies to all farm animals. Except with hogs and sheep, the time is shorter. I bought some clover seed a few days ago and if I succeed in getting a stand it will be 18 months before I get any return.

I have been advocating that we feed our crops to stock. This spring, owing to the drouth, most of us will buy corn and hay to feed our work stock to raise a crop of corn, hire help to cultivate it and gather it. If we decide to feed it to stock next summer on grass, the return is at least 18 months off. The money in the majority of cases mentioned must be borrowed; besides, most farmers are in debt on the land on which the corn was raised. You can see that the interest will be pretty big by the time it is paid. It is this that keeps many men out of the stock business and especially young men. To pay interest on land, on implements, on work stock, on young growing stock, cuts a pretty big slice out of the profits.

I notice with a great deal of pleasure the effort the editor of The Missouri Farmer is making for cheaper and longer time money for Missouri farmers and to my mind this is an important thing to do. As I have said, banks do not like long loans and the farmer's business is such that he cannot work on short time money. I think it will be a great encouragement to young men to buy land and to handle stock if they can get cheaper and longer time money. I hope farmers will study this question and tell us what they think about it.

J. S. Bedford, Boone County.

International Harvester Manure Spreaders

YOU are interested in the results you get from a spreader, rather than in the features. Still, the only safe way to be sure of getting results is to know for yourself the purpose of every feature on the machine. I H C manure spreaders have all the important, necessary spreader features, therefore when you know I H C spreaders, you know them all. In a spreader you want a machine that will break up manure into small particles and spread it evenly and that, finally, will last long enough to pay for itself. You don't need a spreader to haul manure in, your wagon will do that.

Spreading manure is heavy work. To begin with, manure itself is heavy. It takes both power and strength to tear it up and scatter it. Power and strength require strong wheels and trucks, a stiff frame, heavy bearings. Your spreader then, had better be a little too heavy than a little too light. That little extra weight makes it stiff and strong, keeps the bearings in line, prevents warping and jamming of the apron, cuts out all necessary friction and wear, adds nothing to the draft of a loaded spreader, but adds years to the efficient life of the machine.

Don't wait until you are ready to buy, but begin now to study I H C spreaders. See the machines at the place of business of the I H C local dealer who handles them. Write to us for information that will help you to get the biggest value for your spreader money.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII February 15, 1915 No. 4

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim nad we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always enclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

DOUBLE TAXATION

Since the organization of this state we have suffered from a system of double taxation that has placed an extra burden on the debt-burdened citizen. The system we complain of is the one that seeks to tax about one-third of the real estate of Missouri twice while other property is taxed but once and much of it not at all. A man owns a farm worth $10,000 and owes a debt secured by mortgage for $5,000. He is taxed on the full value of the farm and the holder of the mortgage is taxed on one-half its value which he holds in the note secured by the mortgage. Numerous efforts have been made by legislators to remedy this injustice but they have usually proceeded along impractical lines. The man who holds title to the land must pay taxes on the full value of the farm and so he reasons it is nothing more than right for the fellow who holds the mortgage on the land to pay on the mortgage. Here is where the land owner is compelled to pay the double tax although he may not know that he is doing it. Taxes and other expenses are taken into consideration by money lenders just the same as they are considered in any line of business. If real estate mortgages more attractive to investors and Missouri that would make our mortgages more attractive to investors and thousands of dollars which now go out of the state to escape taxation would be loaned at home. The increased demand for our mortgages would have a tendency to lower rates of interest and the borrower would get his rebate on his double taxation in lower interest rates.

Land is valued for taxation at from one-fourth to one-fifth its marketable value. If a farm is assessed at one-fourth its value and the total rate of taxation is one and a half per cent that equals three-eighths per cent on the full value of the land. A $10,000-farm on that basis would be assessed at $2,500 and at one and a half rate for taxes would pay $37.50 to the tax collector. If the farm had a motgage of $5,000 against it and that much was charged to the mortgagee the farm's tax would of course be reduced one-half, or $18.75 yearly. This plan would be fair and just were it possible to find a successful way of collecting the other half off the money lender. No successful plan has ever been devised so far as we know to do this. But if we exempt the mortgages on the other hand and it results in a lower rate of interest, which there is every evidence to believe it would, then the borrower would save in interest more than he pays in taxes on what he does not own. In the above instance a reduction of one-half of one per cent in the interest rate would save him more than the taxes on the encumbered part of the farm.

We are not in favor of any man or class of men escaping their just share of taxation but we do think we can profit by studying the ordinary methods of business and determine just what is practicable as well as what is right. In our demand for lower interest rates on farm mortgages we believe one of the first steps we should take is to exempt real estate loans from all forms of taxation. This in the end will be in the interest of the borrower more than the lender.

—o—

FOR SHEEP PROTECTION

Not for a long time have there been so many bills introduced in the Legislature looking to the protection of our sheep industry as there have been proposed this session. There are a number of serious minded men in this Legislature who realize the great importance the sheep industry bears to the welfare of the state. It goes without saying that Missouri has equal advantages with that of any other state for profitable sheep husbandry. No class of animals except possibly dairy cows can be used to better advantage than sheep for the maintenance of soil fertility. Any man who will study our annual crop yields in Missouri in comparison with the best crop producing states will at once realize that something is wrong with our system of farming. There may be a profit in growing corn and wheat on our better class of lands but there is no profit in grain farming on millions of acres of our poorer lands. It is about time we were becoming less sensitive as to state pride and that we should look at these questions in a matter of fact way. If we have several million acres of land in Missouri not adapted to grain growing let us say so and look about to find a system of farming that will make these acres profitable.

Hundreds of farmers who have tried sheep farming in Missouri say they have found it profitable except for the loss from dogs. Many of them have gone out of the business on account of this loss and others have stayed out for the same cause. The man who owns a pig, a calf or a lamb must take care of it and keep it confined within his own fields under the stock laws of Missouri but the owner of a dog is a privileged character and may let the dog prowl at will day or night. If the members of the present Legislature want to do the state a real service they will at least put the dog owner under the same rules to take care of his dog that the owners of other useful stock must observe. We do not ask that the privilege of keeping a dog be taken from any one but we do think the owner of a dog should be required by law to keep his dog on his own farm.

—o—

SPRING WHEAT

We have had several inquiries recently asking if it is advisable to sow spring wheat in Missouri this season in view of the present high price of wheat? The Missouri Farmer urged its readers to sow as large an acreage as it was possible to sow in good condition last fall because we believed then and see no cause to change our view now that wheat must bring a good price until the close of the European war if not much longer. But we said then we would not sow wheat at all unless we could sow it in good condition. Now as to the advisability of sowing spring wheat because of present high prices let us say there is much greater risk of getting a good crop of spring wheat than of the winter variety. The last thirty years have seen the southern line of the spring wheat belt pushed gradually north by winter wheat and there are now hundreds of thousands of acres of winter wheat raised in Nebraska, Iowa and other northern states in place of spring wheat formerly raised. There must be a reason for this and there is. When winter wheat winters well it will out-yield the spring variety first, perhaps, because wheat fills better in cool weather, and ten days to two weeks difference in the latter half of June or fore part of July may make a lot of difference in temperature. Then this difference in time gives the chinch bugs and the rust a better chance to attack the spring wheat.

However if we happen to have a season altogether favorable spring wheat may do exceedingly well in the northern half of Missouri but we would suggest that the favorable condition is not very apt to come very often. So the man who sows spring wheat takes considerable chance. For sowing spring wheat we would prefer getting the seed from southern Iowa or Nebraska if we could not get it closer home. We would prepare the seed bed thoroughly using preferably fall plowed land or last year's corn land that was given clean cultivation. Spring breaking will require a great deal of work to get the fine compact seed bed that wheat needs. We would not risk broad cast seeding but would sow with a drill and would sow not less than one and a half bushels per acre. The spring wheat does not have time to tiller so much as winter wheat and hence should be sown a little thicker. Unless the land was in a high state of fertility we would sow about two hundred pounds of a high grade fertilizer with the wheat. One advantage of the fertilizer will be to hasten the ripening of the wheat and will reduce somewhat the danger from rust, bugs and hot weather. We would not risk sowing spring wheat unless it could be put in the ground early and when the soil was in good condition. Under such conditions if a farmer has more land than he wants to plant in corn or sow to oats he is not losing much to risk a field of spring wheat for if hot weather catches it he can mow it when in the milk stage and it will make him a fine lot of hay but for this purpose we would prefer a crop of oats.

—o—

Let us urge our readers that if they have not already done so that now is the proper time to test the seed corn. There will be several bad days between now and April 1 that you can not work out doors and you can make these days count for more than the best days if you will test out the seed corn and have it all ready to go into the planter box.

—o—

Let us again call your attention to what you may gain by treating your seed oats for smut. At a cost of fifty cents you can test enough seed for ten acres and it will increase your crop anywhere from 5 to 25 per cent.

WHAT WE ARE TRYING TO DO

The Missouri Farmer is trying as hard as it knows how to be more than just a passably good farm paper. What it is trying to do is to help YOU and those dear to you to get a little more out of life and to have a little more left to show for your toil and sweat at the end of the year. It doesn't make any difference how humble or commonplace that little home or farm of yours may be, we are interested in it and nothing will give us greater pleasure than to help you to the best of our ability—**if you will only give us the chance!** If there is something you are in doubt about—it matters not whether it is the growing of a certain kind of crop, soil fertility, pigs, dairy cows or chickens, write us fully and give us a chance to help. The moment your letter reaches this office it is passed on to Mr. Ellis, whose long years of practical experience and broad research make him one of the safest counselors on farm matters in the Country—and when he is in doubt about anything he refers it to an expert in Missouri's great Agricultural College which is only a few blocks away and in the following issue you will have your answer. It is this willingness to be of **personal service to you** that we wish to impress upon every reader.

In the meantime, we are doing our best to show you in every issue of the paper what other farmers have done to succeed and how they went about it —to carry their message straight to your fireside. Back of all this is not merely the desire to make the paper a success from a financial standpoint—something which is always difficult with a young publication—but the pride which comes from contributing our mite toward better farming methods and better farm homes in this great state.

And, as we toil along by your side we expect to take a moment off once in a while and, to the best of our humble ability, direct your gaze to some of the unseen stars which shine in the azure above your head and which perhaps in your fret and worry you have overlooked. If, by an appeal to the latent fire of enthusiasm which slumbers in your breast we can show you that there is gold enough lying around on that farm of yours to pay off the mortgage—if, by a word or line we can, in a kindly way, coax you to be more considerate of your loved ones who are happy at your smiles and who shrink from your frowns—if we can scatter a few of these sunbeams along the path as we go, won't that be worth while also?

If you like this kind of a farm paper—if you believe The Missouri Farmer really has a useful mission in this state—won't you send us a check or a dollar bill on an early mail and ask us to mark up your subscription for three years? Not long ago we sent a solicitor into a community where many of our readers were in arrears—and as he visited farm house after farm house at least seven out of ten farmers said, "Sure, I want the paper," etc.—and yet they had neglected to send their renewals to us direct while the sending of a solicitor is a very expensive proceedure. In a few weeks you will be busy in the fields and then you won't have time to think of these matters—so here goes a direct appeal to YOU? If your subscription is not paid in advance, I am going to ask you to send your check or a dollar bill so it will reach me on Thursday, February 25th. Of course, a day or two before or after will be alright—but on the above day I hope The Missouri Farmer may receive the greatest stack of renewals in its history—every penny of which will be applied toward making the paper better and more worth while. May I not count on YOU?

—The Author of After-Thoughts.

BUCKSHOT BY THE PROFESSOR

The farmer who treats his hogs like hogs hardly ever makes any money out of the hog business.

There are some farms on which an old rooster and a dozen hens produce more real revenue during the year than "the old man."

Some people seem to live to find fault and complain while others bear their trials and hardshrips in silence and scatter sunshine wherever they go.

I don't believe that any ordinarily intelligent ground hog left his warm hole on the second day of this month just to get a chance to look at his "shadder."

I know some politicians who have put in so much of their time listening to what the wild waves of public opinion are saying that their ears look like they belonged to the elephant family.

That Mexican business is getting on my nerves more and more. It's only a matter of time until Uncle Sam will have to cross the Rio Grande and teach the "greasers" a lesson that will last them a hundred years or so.

Ever since I can remember the politicians have been kicking up an awful fuss about things which they say are wrong—but isn't it funny how little they have accomplished toward putting an end to the things of which they complain?

I don't see much difference between the new democratic postmasters and their republican predecessors. They wear the same kind of an old necktie, celluloid collar, smoke the same brand of tobacco or stogies, all need a shave and a hair cut—and almost the last one of them is ugly enough to scare a baby half to death.

Some of these days we are going to have to find out a little more about the way the big Packers run their business —because to a man up a tree it looks as though they pay the farmer what they please for his cattle and hogs, regardless of the law of supply and demand. Some of these days there is going to be a powerful row along these lines. Mind what I tell you.

Our opinion of men and things is often formed from some particular experience we have had with them. We cuss the railroads because perhaps on some occasion in the past we had a row with a station agent. So we don't like the telephone company because the little girl operator was too busy chewing gum and reading a novel to get the number we wanted promptly. I had an old uncle once who hated a corn sheller like "pizen" because on one occasion he had gotten his whiskers mixed up in the fly wheel.

The other day the engine which was pulling the passenger train on which I happened to be riding broke down near the little town in which we did our trading when I was a boy on the farm. While they were waiting for a new engine I walked back to the station—and there in silence I viewed the dilapidated remains of what, 25 years ago, was one of the busiest little trading points in Missouri. Here, years ago, I sold rabbits for a nickel apiece and many is the load of corn and oats which I have hauled to the elevator which now is in the last stages of decay. Everywhere there was a look of desolation and hopelessness. There are no new buildings while the old ones present a tumble down appearance—all things speaking silently and yet eloquently on the decay of our country villages which I think is one of the burning problems of the time —and one which deserves much more attention than it has received.

—and hundreds of drop forgings that cut down the upkeep cost

It's just another example of the scientific study that Studebaker gives a car. Studebaker engineers decided to make this FOUR cost less to run than any other car of its size on the market.

So one of the things they did in re-designing it was to use more and more drop forgings—247 of them in this one car. To be sure, drop forgings cost us more than malleable castings. But the BIG thing—the thing that Studebaker sought and was willing to pay for—is the fact that the extra drop forgings give the car *extra* safety and *longer* life and *rigidity* that makes it EASIER riding—and at the same time, cut down its weight and its upkeep cost.

Of course, that policy of going to any manufacturing expense to make the car BETTER is only what you might expect in a car that Studebaker built. For you KNOW, as your fathers before you KNEW, the sterling integrity and high ideals that name of Studebaker stands for.

But you'll appreciate even more what that name of Studebaker stands for on a car when you see this FOUR at your local Studebaker dealer's—and see how convenience and SERVICE-giving quality have been built into every detail.

It's the ideal car for use on the country roads that Studebaker knows so well—EASY-riding and EASY to drive—handsome as any car you ever saw—and with POWER, lots of it, more than enough for any roads or any hills you'll ever face. And backed by a National Service organization so COMPLETE that wherever you drive, you are "never more than a town away from Studebaker Service."

Why not see this FOUR to-day—this FOUR that Studebaker built to stand the test of country roads? See it and drive it yourself—and judge how much you CAN get for $985

—because it's a

WHAT DRAINAGE HAS DONE FOR KNOX COUNTY

By request of a delegation of farmers, subscribers to The Missouri Farmer, I am writing a story of the Valley Drainage District, which was organized in Shelby County.

The ditch which starts on our place, the Farm of the Big Meadows, was recently investigated by a committee of farmers for the purpose of reporting back to a drainage district, which has not, to this date, gotten a decree. It seems they are meeting with the same hostile opposition—the history of all drainage enterprizes. I will not argue the ditch problem with the uninformed, as this is the class that advances impractical plans as against all science and experience. At this date ditching is a science. I will state some of the benefits derived from drainage that we are at present enjoying:

First, an increase in acreage of crops; an increase in the amount produced; an astonishing increase in the value of lands. Not only the price has raised, but demand has quickened and sales are more frequent. Instead of the lands having a speculative value, they are now considered a tangible asset by the money lenders.

All this has come about in less than two years. From a condition that promised to bankrupt its operators it now promises, under ordinary conditions, a paying investment. Many acres of corn sold this year from twenty and a half to thirty dollars per acre for standing corn.

The length of this article will not permit us to explain in detail many important truths that farmers and land owners should know, but one principle should never be forgotten: Trust in God and keep your soil dry. It will work just as well a dry year as a wet year, for the dry soil will absorb moisture of the air—the dew.

As this article is being written to give our experience in ditching, it will not be complete without a pen picture of the class that has ruthlessly and viciously robbed the land-owners and the State of Missouri of a splendid income.

The worst hindrance is the man who has bought large tracts for speculative purposes. He pays the tax on unimproved lands and expects to get his profit in the rise of value that is going to come about through the industry and perseverance of the man adjoining him. It is the old story of the unearned increment.

"Fine is the dance
And doubly sweet the lay:
That for the dear dance
Another pays."

He fattens like a leech on the blood of others; or rides to the heights like a sparrow on an eagle's back. The next hindrance is the man encouraged by the demagogue politicians. His credulity preyed upon by the pettifog lawyer, who works him for a retaining fee, knowing that his client has no show. The next is a character that believes it is presumptuous for anyone to try to tell him a better way; and you insult his intelligence by presuming to teach him. He is the hardest of the lot to handle, because he is not receptive and declines to learn. As a rule, he is a cynic of the first order. He sees no good in anything or anybody and all men of vim are dishonest in his eyes. He sees the sinister in their motives. During the administration of a ditch enterprise this man will ride day and night to poison the minds of his neighbors. He will resort to untruth, calumny and distortion and is as cruel as a hog-louse that bites a hog on the back until it sheds tears, in order to get a drink. He is the man who will argue that a blind horse for farming purposes is better than one that can see, for the reason you can drive him closer to the ditch. He is the boy at school that cut off the wings of a butterfly, stuck a pin in its body to make it fly and was kept in after school for giggling. One of his plays is to increase the hatred of the lazy craw-fish artistocracy against his thrifty neighbor. He is the one who will juggle the present bottom land owner out of his land by frightening him with the prospective tax that he will have to pay.

The truth of the matter is you have the privilege of paying ten to fifteen dollars per acre, strung along for twenty years. This very act will develop your land from the raw unfinished material to finished product, which will command the highest price from a class of buyers who will appreciate the value of the land and its improved condition.

The story of developing twelve miles along Salt River bottom is, to the writer, a tragedy. Hearing of this wonderful valley he came to investigate its merits eighteen years ago and finding it in every way up to his expectations acquired a considerable tract at an average cost of about $20 per acre. Our intention was to develop the same at once, but all attempts to interest the adjoining land owners proved fruitless. We put in a system of shallow drainage that intercepted the hill water only; and made cuts through the short bend of the river—an expensive experiment and an entire failure. We found that the greatest hindrance to growing corn was the pressure water—that water which rises from fountains or springs and produces a water-level that is too close to the roots of the corn. This condition and the overflow was getting worse every year. Things were getting desperate. We were out of money and out of credit. The native population had no desire, or perhaps, no knowledge of how to develop their lands. They began to offer them at nominal price and the lands were picked up by experienced men who knew the science of ditching, for, at this date, ditching is a science.

Our thanks are due Messrs. L. D. Breedlove, F. W. Waters, Ed Roy, Dick Vickers and C. L. English, who came to our assistance, furnishing along with our own lands the majority of acres which made it possible to convert a desert valley into one that is now wide and fruitful. Our thanks are also due John H. Nolen, of the reclamation department of the State, for starting us right in ditches yet undug. We had many obstacles to surmount and many difficulties to ovecome.

On streams that the howling savage still controls, history waits. Why do weeds grow faster than corn? Ignorance spread faster than knowledge? Why the destiny of every race has been cut out by the sword is one of the problems yet to be solved. The owners of this swamp land, discouraged with depleted bank accounts, started to better their condititition. They met with hostile opposition that knew no limit; even down to the lowest treachery by persons entirely uninterested financially.

How the work is done—a big ditcher at work

Well, the ditch is finished. It is nearly twelve miles long and has increased to an average of sixty feet wide at the top. Its sides are clear from all rubbish and it is naturally eating itself to a size that will accommodate all overflows. Being dug in that natural groove between river and foothill causes it to dry up all spouty places, springs and pressure water. It has warmed the ground by drawing out of it the cold water. The air that rushed in when the water disappeared, has caused the earth to slacken, which makes the ground porous. The heat permeates it, resulting in the proper temperature to make the corn grow readily. The dryness of the soil absorbs the dew to almost a fourth of its weight. This same condition of the soil keeps away the frost by drying the air. Moisture likes a vacuum. We have gained close to two weeks in the fall and two weeks in the spring. Drainage has improved the quality of the land immeasureably. April planting has happened. Drainage has deepened the soil, causing it to resist the drouth. The water level being reduced the corn does not stand in the spring, but flourishes at the start. Drainage has raised the temperature of the land. It freezes deeper and thaws earlier. You cannot compare these swamp lands with the hill lands adjoining them or with the upland prairie. They belong to another class.

Sharpen your pencil and figure from an investment standpoint. An acre of ground that will raise forty bushels of corn—and this is conservative, for we have raised 80 to 100—forty bushels sold at fifty cents per bushel is five per cent on four hundred dollars.

Young man, if your father has gotten into a rut, take the matter up, yourself. Consider that the 40 or 60 acres down there in the bottom can be made to produce or earn interest on from two to four hundred dollars per acre. This is no guess work. It is a matter of history backed by the best business men. Some of the men are too selfish to tell you to get in. Keep in mind that the branch bottoms in all countries are the last to be developed. It has been the history of the world. The reasons are natural enough. It requires more labor and capital. The neighborhoods have to act in concert, with the co-operation of the State. At this writing we believe the good State of Missouri has furnished us the best law in the world. As a matter of flattery to the farmer, will say that the finest points of the law were originated and suggested by farmers.

We are not going to forget to thank The Missouri Farmer and the press in general, for its advocacy of all good reclamation schemes.

If you want to go over the entire property, which includes ten thousand acres or more, come to the Farm of the Big Meadows. We will show you that we have sold the highest priced lowlands, considering the distance from a railroad, that has ever been sold in Shelby county, $125 per acre, subject to all ditch tax. We will be able to substantiate all we have claimed.

There are thousands upon thousands of acres of river bottom land that can be brought up by proper drainage to a degree of merit that will make them

Just like raising bumper crops

Every man who *packs* Prince Albert tobacco into his old jimmy pipe gets back 100% pleasure and satisfaction. Sort of like getting bumper crops!

Prince Albert certainly will give you more happiness than any tobacco you can smoke, because it not only has a remarkable flavor and aroma, but it is made by an exclusive patented process that *cuts out the bite!*

PRINCE ALBERT

the national joy smoke

will surely revolutionize *your* pipe-smoke notions.

And Prince Albert is just as joyous, just as sunshiny, rolled into a home-built cigarette as in a pipe.

Invest ten cents for a tin and *know for yourself* how good Prince Albert really is.

Sold everywhere in toppy red bags, 5c; tidy red tins, 10c; also in pound and half-pound tin humidors and in handsome crystal-glass pound humidors with the sponge in the top that always will keep your supply of P. A. delightfully fresh.

R. J. REYNOLDS TOBACCO CO.
Winston-Salem, N. C.

bring equally as much as similar lands in other states. It is erronous to compare bottom lands with soil from three to six feet deep, with hill lands in the same neighborhood. The time is fast coming when there will be a difference in selling price of from one to four hundred per cent.

Land must be figured on a rental or income basis. If the side hills or uplands do not make the interest charge, they are too high. If the lowlands are producing an income to exceed what they cost, they are too low.

In answer to some questions: Our district has a fund that was left over and is now on interest, same to be used for maintaining, repairing, etc. The average cost on the first district was $13.05, second district a little more. Some lands, not subject to the worst overflow, were assessed very low; also the high timber lands, close to the bank, were not given the full penalty.

Good judgment and fairness have prevailed all through the administation and construction. The ditch was dug for much less than the estimates. It is not the first ditch ever dug. Hezekiah also stopped the upper water course of Gihon and brought it straight down to the west side of the City of David. And Hezekiah prospered in all his works.

Henry Funk,
Farm of the Big Meadows,
Clarence, Mo.

OUR INSECT PESTS AND THE WINTER TIME

Nineteen Hundred and Fourteen was a memorable year from the standpoint of the number of insect pests doing damage to the crops and pastures of Saline County. Figuring very conservative damage percentages, and more conservative than most farmers would be inclined to figure them, the army worm, Hessian fly and chinch bug easily damaged pasture, hay, wheat and corn to the extent of $700,000 in Saline County alone. This leaves out of consideration grasshoppers, which were unusually bad, the grass web worm, the corn ear worms, the wheat louse, the clover weevil, the corn bill bug, the corn root louse, the melon aphis, the striped potato beetle, the codling moth, the San Jose scale and the cabbage worm, every one of which did damage. Some of these latter ones even did more damage than was thought. The appearance of the San Jose scale is a real calamity from the standpoint of the orchardist. There are few commercial orchards in the county, but the scale is present in one of the largest of them, and this will mean special spraying in order to control the pest. The myriads of white cabbage worm moths seemed to be rather harmless, but some rape patches were observed in late summer which had been ruined by them. The wormy corn has had a bad influence on the live stock of the country and may have increased the cholera fatality (it does not cause cholera) and caused some loss of horses. On the whole, the things that crawl and creep doubtless did destruction in Saline to the amount of a million dollars at the lowest estimate.

Some visitor to the Farm Bureau office called 1914 the year of seven scourges, and he enumerated them in the following order as nearly as we can remember: 1. The Hessian fly; 2. The army worm; 3, The drouth; 4. The chinch bug; 5. The wind and hail storms that laid the corn upon the ground and damaged the crop; 6. Foot and mouth disease which upset the markets; 7, Hog cholera, which has been unusually prevalent. Perhaps some one could add a few to this, and at least give the unsettling influence of the European war a place, but it sounds better to say "Seven Scourges", so we will add no more.

Just what a severe winter will offer in the way of relief from the various insects is a matter of interest.

First, in the case of the army worm, little can be told. That insect is dependent upon favorable conditions at the time when it usually comes out. It is in the pupal stage in the ground at the present time and will doubtless survive the winter there, but that may not mean that we will have army worms next year. In the first place, the pupal army worms in the grass meadows now are the grand children rather than the children of the horde that was here in the spring of 1914. There were very few of the second crop seen and there is an interesting fact in connection with this, too. Those numerous worms in the spring were, if conditions favored it, to pass through a pupal stage into a moth stage. These were to lay eggs which would bring a second crop of worms late in July. The moths were here all right in such numbers as to cause alarm although they were out of hiding only at twilight time. The eggs from these worms, if there were eggs, never hatched or at least never brought our second crop of worms. The few that there were left the seed for next year's crop. There are seldom two bad broods of these pests in a season and there is no reason to expect them next year more than we have usually expected them.

It is another case with the Hessian fly. It now rests in many wheat fields in the flax seed stage in which it is very resistent to winter conditions. The flax seed is not an egg but a pupa into which stage the cutting worm passed last fall. The fly seemed to be in nearly all the volunteer wheat and in the early fall sown wheat. We have even had reports that it was present in some of the very late wheat although we have not seen it there. If it is there it means that owing to the continued warm weather in the fall, some of the flax seeds which usually remain in that state over winter hatched out a late bood of flies. If so, it was the early sown wheat that made the second brood possible.

To the question of present control of this insect, there is only the answer that it is now too late. Of course, for the protection of uninfested fields, infested fields could be plowed up, but there is no likelihood of such a thing being done. Every one would prefer now to run the risk of some weather condition unfavorable to the fly at hatching time coming along to save the day. Everything indicates that it will only by some such favor on the part of spring weather that will save us from another Hessian fly loss in 1915. If it comes, it is likely that voluntary committees of farmers will have reached the point next fall of waiting upon neighbors who want to sow wheat early and asking them, for the sake of thousands of dollars' worth of wheat, to refrain from doing so.

The chinch bug presents still another case. He is at present a life-sized, full grown bug, just like he was last seen when he fell out of the corn husks and stalks that he had been sapping the vitality from. He has hunted the best protection that the corn shocks, hedge fences, and fence corners will provide. The winter will kill the chinch bug if he is disturbed in his winter quarters. A chinch bug clean up week might save the county thousands of dollars. It merely means cleaning up all such places as those mentioned.

In this connection the hedge fence always comes up for consideration. This way-side shrubbery has a mighty hard time to justify its existence any way. It harbors insects; it cuts the yields of many acres of corn which it shades and robs of moisture; it makes blind corners that favor collisions and runaways and possibly deaths; it shades roads and makes them muddy in the spring; untrimmed as the hedge is ordinarily, it is a blot upon the landscape. In the light of these facts, why the hedge fence? A clean up of the hedge fence and chinch bug together would be a good thing.

Paul V. Maris,
Farm Adviser of Saline County.

SWAT THE HOG LOUSE

At this time of the year the hog raiser cannot afford to overlook the louse question in his herd. Hogs that are lousy do not make profitable gains. The louse is a blood sucker and therefore weakens the hog and renders it more susceptible to disease. During spring and summer a mud wallow with a little oil on the surface of the water affords the hog one means of combating the louse, and during the warmer months the dipping tank is efficient, but with the advent of winter both these means are practically out of the question, and then some other plan must be adopted.

There are at present a number of different kinds of patent hog oilers on the market that are proving very satisfactory adjuncts to the hog yard. They are all designed to apply crude oil, the most satisfactory louse-killer, to the hog. Some of them serve as a rubbing post and as the hog rubs against the post oil is applied to the point of contact—which by the way, is usually where the louse is. The oil spreads once it reaches the body and is death to both the louse and the nit.

These oilers are very simple in construction, do not get out of order, will last a life time and are not expensive. They can be moved about from place to place. Hogs and even small pigs learn how to operate them very quickly. If your herd is troubled with lice we would suggest that you investigate this proposition.

R. P. Royce.

FARM MANAGEMENT PAGE

D. H. Doane, University of Missouri

"Help me to see a potential friend in every man I meet."

Though philosophers fail, love will teach us that great motto: "Live in the present moment." Only by speaking the present word softly, thinking the present thought kindly, and doing the present act gently, may we make today bright with the light of that perfect future of which we dream, and make that perfect future real through the life of today.—Ella Wallace Wells.

Nearly every season sees one best time for doing each field operation. The man who wins is the one who is prepared to take advantage of that particular time.

Boys and girls planning to undertake club work in the form of corn growing, tomato growing or other activities that take the full year, should have plans pretty definitely made by this time. The one who wins is the one who puts brain with muscle. Now is the time to use the brain part.

Do You Remember Pat?

He is the little fellow that brought the speaker a peach up at Mr. Gartin's a year or so ago. I drove by his home not long ago and saw him out in the field some distance from the road, near enough, however, that we could wave. This is a story that another told me on that occasion.

Due partly to Pat's influence there were soybeans on the farm this past year. Pat watched this crop jealously throughout the whole season, noting every detail of the preparation of the seedbed and putting in the crop. When cultivating time came Pat thought that it was not being done right and he tola his father so, as he was doing the work. The father naturally rather tersely attempted to brush the boy aside, but he persisted. "I'll tell you, dad, the professor said soybeans should be cultivated so and so, and I know we've got to do it that way. I can prove it by what he wrote on the subject and I will go to the house and get the paper and show you." Arguments did not seem to avail in this case and so off went Pat to the house, brought the paper to the field and produced the written evidence. Pat has the spirit of the Farm Management Page—"Do." The soybean crop was a success.

A New Farm Management Bulletin

Mr. O. R. Johnson and W. E. Foard, members of the Farm Management Department here, have recently published a bulletin on "Land Tenure." It is the result of a farm management investigation in western Johnson County and shows some very interesting and helpful facts in reference to the landlord and tenant situation.

For example, it shows that the average labor income for all the farmers of the community was $422. The average for the tenant was $501 and for the owner $314. This means that the average farm owner of this community has left only $314 for his labor at the end of the year.

Another interesting item has to do with the value of an education. In considering the difference in labor income made by the farm owners who had more than a district school education as compared with those who have just a district school education, it was found that the difference amounted to $616 a year. The difference in the case of the tenant was $304. This would indicate that an owner could afford to invest $12,000 in an eduaction and at 6 per cent it would return him a profit. Yes, an education does pay.

There are many more interesting and helpful points that every eader of The Missouri Farmer will get from this bulletin. Write to the College of Agriculture and say that you want Bulletin No. 121.

Sheep Feeding and Farm Management

This seems to be the proper time to tell of our results with sheep feeding and for that reason we are devoting most of our page this time to this subject.

The Missouri Farm Management Association members have closed another year of successful feeding of western lambs. The plan or system followed is practically the same in all cases and is one that was planned and organized some five or six years ago. It is a composite of the most successful principles and practices of sheep feeding that exist on the farms of successful feeders throughout the Middle West. It is adapted to the man who has had little or no experience and is willing to follow closely, definite suggestions and instructions. One of its chief features is the fact that it adapts itself to such a great variety of farm conditions, and with a little peparation can be worked in on most any Middle West farm where there is as much as twenty acres of corn.

It would seem that now is the time to tell the results of last year and speak plainly in reference to the necessary preparation for the coming year. We cannot expect good results if we make our plans for feeding next September or October, when the time for purchasing the feeders is at hand. The successful feeder makes preparations **now.** Briefly, these are the necessary preliminary steps.

At corn planting time cowpeas should be planted with the corn in the hill. This is done with a cowpea attachment to the planter. Planters that have satisfactory attachments are the Black Hawk and John Deere. Others may also have good attachments, but I do not happen to be familiar with them. The peas are planted at the rate of about eight or ten pounds to the acre, about three peas to two grains of corn. It is not wise to have a greater proportion of peas to corn than the amount mentioned. If the seed is inferior, plant more but be sure that the growth will not exceed three pea vines to two stalks of corn. The best varieties of cowpeas that we have found in the order named are: Blacks, Clays, Red Rippers and Whippoorwills. We have had no experience in putting the peas in listed corn and I am not prepared to make suggestions in reference to this method. The peas can be planted just as successfully, however, with drilled corn as checked. With the planter I have mentioned the peas are planted right up in the hill and do not in any way interfere with the cultivating of the corn.

In addition to the peas in the corn there should be provided about one-tenth of an acre of rape for every acre of corn and cowpeas. The rape should be put by itself in the same field with the corn or nearby. It should be drilled in rows in the spring at the rate of about four pounds to the acre. It is customary to broadcast rape, but this method of seeding is not dependable. The rape is used to finish off the lambs after the first early frost, and I count it one of the most essential parts of a successful feeding plan.

The lambs are purchased during September or October and are first turned into the corn and cowpea field. They should weigh around fifty-five pounds and be free from wrinkles. As soon as they reach the farm they should be turned onto a comparatively short pasture and left there until they get well filled. After this they may be turned into the corn and cowpeas and allowed to remain there for two or three hours the first day and then turn back in the pasture. Turn them onto the corn and cowpeas again the second day and allow them to stay a little longer, gradually increasing until they finally get on full feed. This should take from two to three weeks, and as soon as they are eating the cowpeas readily they should be left in the field all the time. Water should be hauled to them in barrels or tanks if it is not possible for them to drink from a stream or pond. It is advisable to count the lambs in and out of the field frequently so that close observation may be kept in the way they are going onto the feed and to note whether any of them are getting off or not.

When the first frost comes any remaining cowpeas will be killed and then the lambs will have to be finished on the rape. If the frost should be an early one, it will come before the lambs are finished and a change from the green cowpeas to any harvested feed is almost sure to bring about a setback. Consequently, it is necessary to have other green feed ready for them and this need is filled by rape. They are turned onto this feed and allowed to consume the rape, and it should furnish them pasture during an ordinary season for about twenty to thirty days. This will finish them and get them in sufficient condition to top the market, if other factors are up to standard.

It is advisable to allow the lambs to gradually work onto the rape before the cowpeas are completely consumed. This brings about the change in a less abrupt form.

The question that naturally comes up at this time is in reference to whether the lambs eat the corn or not. Under ordinary conditions they do not. Western lambs are unfamiliar with grain and unless the corn is down very badly or they run out of undergrowth feed, they will not bother the grain to any extent. Ordinarily, a deck of lambs will not eat more than five or ten bushels of grain.

If it is possible to speak of average or expected results, the following might be given. In a forty-acre field where there is a good growth of cowpeas and sufficient rape to finish on, there should be enough undergrowth to fatten a double deck—300 to 325 lambs. A feeding period lasts from sixty to ninety days, and a fair gain is from sixteen to twenty-four pounds. Buying price varies from five and one-half to seven cents and selling price is generally from one to two cents above purchase price. A fair profit is about one dollar per head net. From the following figures some actual results for this year may be gathered.

The Telephone Unites the Nation

AT this time, our country looms large on the world horizon as an example of the popular faith in the underlying principles of the republic.

We are truly one people in all that the forefathers, in their most exalted moments, meant by that phrase.

In making us a homogeneous people, the railroad, the telegraph and the telephone have been important factors. They have facilitated communication and intervisiting, bringing us closer together, giving us a better understanding and promoting more intimate relations.

The telephone has played its part as the situation has required. That it should have been planned for its present usefulness is as wonderful as that the vision of the forefathers should have beheld the nation as it is today.

At first, the telephone was the voice of the community. As the population increased and its interests grew more varied, the larger task of the telephone was to connect the communities and keep all the people in touch, regardless of local conditions or distance.

The need that the service should be universal was just as great as that there should be a common language. This need defined the duty of the Bell System.

Inspired by this need and repeatedly aided by new inventions and improvements, the Bell System has become the welder of the nation. It has made the continent a community.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY
AND ASSOCIATED COMPANIES

One Policy *One System* *Universal Service*

It might be well to add here that Farm Management Association people have fed lambs for four or five years and there has been but one of these men who has had previous experience. In no instance have any of our men lost money and this in the face of severe losses by some very experienced feeders following other methods.

It is probably best to mention that in the last two or three years there have been indications of a disease supposed to be "big head" that has attacked some flocks of sheep soon after they were landed on the farm. These attacks have been most disastrous and have resulted in some very serious losses. The trouble is probably one that originated on the range but came to its culmination on the farm of the feeders. The system of feeding has had nothing whatever to do with it and it may attack any bunch of sheep at any time. Its occurence is quite rare, but in fairness to those contemplating feeding, these points should be mentioned.

A few specific instances telling of just how the men handled their sheep individually, might be interesting.

This year Mr. Hall bought a single deck rather early. After getting them home they started to die. He shipped them out as soon as possible, but lost about $300 on the deal. Soon after this I went to his farm and we had a long talk about the whole matter. He was very much discouraged. He had an excellent amount of undergrowth on the farm, the best that he had ever had. The lambs that he had had seemed to be the best that had ever been shipped him, and it seemed that fate had struck at a most inopportune time. I believe he even had visions of some means of travel between town and home other than the old gray horse and buggy, but it now appeared that the vision of profit was turned into a most severe loss. It was a pretty hard thing to make suggestions. However, this was our final conclusion. There was the best amount of feed on the place that had ever been produced there. If the feed was not consumed the present loss was bound to be registered at the end of the year. There was an opportunity to get it back in the same way that it was lost, and so the final conclusion was "Try it again, just twice as heavy."

A few weeks later a neighbor saw Mr. Hall driving two decks of lambs out to his home and he held up his hands in horors and exclaimed, "Man, it must be you are crazy." "Well," Mr. Hall replied, "If I lost my knife out in the horse lot, I wouldn't go to the yard to hunt for it." Less than fifty days after the second lot of sheep was purchased one deck was shipped back and they netted nearly $2 a head, which cleared up the loss on the deck that was purchased early in the season. Eighty days later the second deck was shipped and a net of a little over a dollar a head was realized, which brought the profit on feeding lambs up to the normal expectation for the year. It always takes feed, it always takes good care, good judgment is a requirement and in some cases a big supply of **nerve** is required, to successfully feed sheep.

Mr. Todd heard of the sheep feeding plans at Farmers' Week a year ago. This year when someone was talking about going to Farmers' Week he said, "Well, I am going back because Farmers' Week last year meant a clean thousand dollars to me and what's more, I have it in the bank to prove it." That is his result from his first experience in feeding lambs under the Farm Management plan.

Mr. Beazly records his first experience with a profit of $258 on a single deck of 160 lambs.

Mr. Gartin had some bad results and lost some lambs from what he thought was the big head. He shipped them to market and the commission man told him that they were not ready and to take them back and continue to feed them. This he did and the final results show a very handsome profit.

I think all of our readers will agree that the Farm Management plan for feeding lambs has justified our Farm Management work, if nothing more ever comes from what has been undertaken. We surely hope that we can be of continued assistance to our friends and that the circle of those who may profit will grow larger.

Why Great Western Gets *All* the Butter Fat

Rural Social Centers

We need social centers where our young people can be entertained, amused and instructed under the direction of cultured, clean and competent leadership, where aesthetic surroundings stir the love for the beautiful, where art charges the atmosphere with inspiration and power, and innocent amusements instruct and brighten their lives.

To hold our young people on the farm we must make farm life more attractive, as well as the business of farming more remunerative. The school house should be the social unit, properly equipped for nourishing and building character, so that the lives of our people can properly function around it and become supplied with the necessary elemets of human thought and activity. Peter Radford,
Lecturer National Farmers' Union.

Here's the Baby Avery Tractor. Built Just Like Its Four Larger Brothers

This is the small farm size Avery Tractor. It's built just like the four larger size Avery tractors. It's the only small tractor built just like the larger size tractors put out by the same company. It's no new experiment.

This little 8-16 h. p. Avery tractor is just as strong for its power as the larger sizes. There is almost no wear out to it. It's light weight but not flimsy. It's built simple but not built cheap. It has a double opposed motor designed especially for tractor use—it's not simply a stationary gas engine or an automobile motor mounted on wheels and called a tractor. It has a strong clutch of the steam engine type—not a light automobile clutch. It has a straight spur gear transmission—not sprocket chains.

ADVANTAGES OF THE POULTRY BUSINESS

The poultry business has several great advantages. One advantage is that it can be conducted in a modest way in the back yard of the city dweller or on a large farm, where many hundreds, even thousands of fowls may be hatched, reared, and prepared for market, either as broilers or matured stock. Women, too, have proven themselves quite as able and successful as men, both rearing chickens in the ordinary way, or by the use of incubators and brooders. I know of people who have sold 200 and 300 dollars' worth of eggs and poultry raised on the back half of a city lot in one year. Not only one year but year after year in succession. Every time the hen cackles she is singing praises to the great poultry industry, and the proud American eagle will have to take off its hat to the hen.

Nine out of ten flocks of poultry are lousey. Perhaps that's the reason you are getting no eggs. Catch your hens, examine them carefully around the vent in the fluff. The chances are you will find them there. Then get busy with a good lice powder—getting the powder well down to the skin. A lousey hen can't produce many eggs. Do not dip your fowls in a stock dip, they may catch cold and die and then you won't have any fowl to dip.

If you have the "chicken fever," do not try to cure it with aconite but better get an incubator or a dozen pullets.

Experience has taught us that business is good when you advertise for it. If you have surplus cockerels, pullets or eggs for sale, try an ad in The Missouri Farmer poultry column.

The Missouri Farmer is willing and anxious to help its readers raise more and better poultry. If you have any poultry problems to solve let us know what they are and they will be answered through the columns of this paper.

Let us help you build your poultry house or repair the old one. We may help you to know how to keep your poultry house in a clean, healthy, sanitary conditions; how to keep your old hens from getting too fat; how to mate your pens for best results; how to feed baby chicks; how to raise every duckling; how to make ducks lay in winter; how to keep your eggs from spoiling in hot weather.

The more questions you ask the better we will know you are interested in poultry.

There are instances known where people have ordered incubators and brooders and then absolutely ignored the manufacturers' instructions as to their operation. Few, if any, incubator instruction books are written without giving reliable and valuable information on all phases of poultry raising, from the egg to the dressed fowl for table or market. Nor is this special information a matter of guess work? It all means a great deal more profitable results from the poultry yard. To study it diligently with a view to using it, brings more profit than to criticise it as being of little importance. No class of business men in the country have spent more money for postage stamps, stationery and other things for writing letters to give practical and helpful information than the incubator manufacturers, and they have been doing it on a slim margin of profit on their goods. If the poultry industry of today is on a profitable basis, these manufacturers have contributed largely to that end.

The cleaner the hen house, the healthier the hens and the more eggs they will lay.

It is true that the busy man always has time to do one thing more.

Keep the ice out of the drinking vessels. You are not drinking much ice tea yourself now days, are you?

If an incubator does not hatch as large a percentage of chickens as hens, it's your fault, not the machine's fault.

Fowls are like people in some erspects—they need a variety of diet.

Poultry is one of the farmer's best crops.

Put sage in the dressing and common sense in your poultry work.

If you want a pocket of money out of the 1915 poultry business, get busy and stay busy.

Sell just what you advertise, live up to every statement made and an honest mistake is easily adjusted.

Sunflower seed is more than 90% waste matter. Why do you want it in your hen feed, when it has practically no food value. E. L. Andrews,

Queen Poultry Yards, Maryville, Mo.

YOU SHOULD START RIGHT

This is one of the most important seasons of the year in the poultry yard for it is during this season that the flock should be renewed. Much of your success next year depends upon the flock you raise this year. A little care now in selecting, mating, incubating, and brooding, will do much towards making an active, healthy, vigorous, profitable flock.

Upon placing a male with hens which have not had a male with them, the eggs become fertile in about three days and remain fertile for fifteen to twenty days after the male has been removed.

Feeding the growing pullets a moistened mash to hasten growth. Missouri Poultry Experiment Station, Mountain Grove, T. E. Quisenberry, Director

If the eggs are infertile the birds should be examined. Collections of louse eggs on the base of feathers or the accumulation of droppings on the feathers about the vent, often prevent the proper communication between male and female.

An 80% fertility and 80% of the fertile eggs hatching is considered a reasonable hatch. This means 64 chicks out of 100 eggs set or about 10 chicks out of a sitting of 15 eggs.

If the eggs are to be held before sitting, they should be kept at a temperature of from 40 to 60 degrees and should be kept covered so the albumen will not evaporate.

When the chick comes out of the shell it is made out of the albumen or white of the egg and has used little or none of the yolk. If the albumen has evaporated too much, there is not enough material to build a chick large and strong enough to get out of the shell. This is one of the causes for chicks dying in the shell. This evaporation may take place either before or during incubation.

Early hatched pullets mature and begin to lay before winter begins. They make good winter layers and are good breeders the following spring while the late hatched pullets do not lay before spring and if used in the breeding yard, produce a low per cent of chicks which are small and weak.

It is advisable also to rear the entire flock as near the same time as possible, for in flocks where there are chicks of all ages, the youngest ones seldom amount to anything. Then, too, if they are all reared in one brood, it takes only a short time till the chicks are large enough that they need very little attention. On many farms only a small number is hatched at a time, requiring almost the entire summer of work and worry to renew the flock.

The indications are that the present Egg Laying Contest is going to be one of the most interesting and instructive contests ever held, owing to the fact that the birds were raised under practically the same climatic conditions.

The race so far is very even. The leading pens for the three months of November, December and January as well as the leading pens and hens for January, are scattered among the many varieties. The all-purpose breeds receive a large per cent of the honors.

	Eggs
Buff Wyandottes, Missouri	182
Buff Orpingtons, J. W. Jackson, Paris, Missouri	177
Barred P. Rocks, E. B. Evans, Mountain Grove, Missouri	176
Barred P. Rocks, Missouri	176

Buff Orpington, J. W. Jackson, Paris, Mo.	43
Barred Rock, Missouri	42
White Orpington, W. R Kendall, Independence, Mo.	42

EGGS FOR NEXT FALL

The Department of Agriculture, in a bulletin issued recently, says that if the farmer wishes to benefit by the high prices that eggs are certain to bring next fall and winter, he should begin to get ready for them at once, say the poultry specialists in the department. The way to have eggs late in the year is to hatch pullets early. It is the early hatches from which the early pullets are derived that are the largest money makers for the poultry producer. The early hatched cockerels can be marketed in almost any market in America when they attain a weight of three-fourths of a pound to a pound and a half each, which they should reach at about six to ten weeks of age, respectively, at a greater profit to the producer than at any other time of their lives. The early hatched pullets, if properly grown, should begin to lay in the fall at the time when eggs are scarce and high in price. Pullets must be well matured before they will lay many eggs. Pullets that start to lay in the fall before cold weather sets in will, as a rule, lay all winter. It is the early hatched pullets that produce eggs in the fall and early winter, when prices are high.

February, March, and April are the months to do your hatching in order to secure early hatched pullets.

Yearling and two-year-old hens do not lay many eggs in the fall, as they are molting at that time, and the feed they consume goes not only to keep up the energy and life of the birds but also put on or grow a new coat of feathers.

In properly matured pullets all surplus energy beyond that needed to meet the requirements of the body is available for the production of eggs.

Wholesome Mush.

Mr. After-Thoughts Man:

The way we feel about the cover page "mush," is that it is not only palatable, but 100% nutritious, furnishing growth of soul and mind, and what helps these finer elements of our nature must help the mortal body. "Toward the Cross" was a sermon in itself. One of our most intellectual women, a teacher and church worker for years, called me up to say how fine it seemed to her. So you know how two women feel, and I know her judgment is good. Mrs. J. O. Johnston.

ADVISORY BOARD

Mrs. N. H. Gentry, Sedalia.
Mrs. Marie T. Harvey, Kirksville.
Mrs. F. B. Mumford, Columbia.
Mrs. R. E. Shryock, Kansas City.
Mrs. J. E. Roberts, Maysville.

[The editor of The Missouri Farmer is impressed with the value of well directed club work among country women and we hope to have the support of every club organized in the state. We would suggest that the officers of these local clubs at once get in correspondence with Miss Alice Kinney, the Editress of this department and give her a report of any good work the local club is doing. There are now probably more than one hundred clubs organized in the state and what a great force for good these clubs will become when they are all working together for one good purpose.—The Editor The Missouri Farmer]

Greetings From Our President

To the Homemakers, the country women's clubs and farm women of Missouri:

As the new president of the Missouri Homemakers' Conference I extend to you greetings. While I greatly appreciate the kind spirit that prompted the action that made me your president, it is with reluctance I take up this great work that lies before me knowing as I do that "while the spirit is willing the flesh is weak" and it will require much hard work to make the coming year what it should be.

As a real country woman, a farmer's wife and a mother, I have at heart the interest and welfare of every farm woman and child in the state and hope with your co-operation and by our united efforts, we may accomplish much toward the betterment and uplift of rural conditions.

We have come to realize that unless our homes are made more attractive and better educational advantages are offered we need not expect to keep our boys and girls on the farm.

This uplift must come primarily through the mother, for the father is kept busy providing for the family, so it is she who moulds the plastic minds and guides the little feet, who prepares their food and makes their clothing.

The country clubs for farm women are the first steps toward this uplift; it is at these meetings we get a broader view of life and outside of our own little horizon we find so much that is worth while.

The woman has at last come into her own, the eyes of the world are upon her who has been and is the mother of so many of our greatest men and women. As the doors of opportunity swing back let us enter in and partake of every good thing in store for us.

It is my desire to get in touch with every club in the state so that we may co-operate and help each other. We are formulating plans and lines of work that we hope will be of benefit to every community and I shall be pleased to receive communications from each and every club in the state.

Mrs. Harry Sneed, Sedalia, Mo.
Meadow Lawn Farm, R. F. D. 1.

Report of Chairman of Poultry Department.

The object in forming poultry clubs is to give better knowledge relative to the importance of the poultry industry; to acquaint the contestants with better methods of handling poultry; to furnish profitable employment during spare time, and to stimulate better interest in poultry culture.

The Plan of the Contest.

The contest may be divided into:

1. The contestant is to care for laying hens or pullets for a period of one year.
2. The contestant is to keep records showing the feed cost, egg production and amount of feed per hen.

This is not to be an egg laying contest, but rather a contest in poultry management. To make a contest simply egg laying would severely handicap some of the members; to make it a contest of poultry management enables the contestant to be judged rather than the stock which he is keeping.

The contest is to begin January, 1915, and end January, 1916.

The contestant is to have not less than six hens, and it is not advisable to have over fifty. The contestant having a larger number will not be debarred, but will be working under greater difficulties—their reports will be greatly appreciated.

Fowls may be of any breed.

No particular kind of house is necessary. The house must be of sufficient size, clean, dry, well ventilated, well lighted and conveniently arranged.

Blanks for making records will be sent out by the College of Agriculture free of charge.

The judging will be by comparison, taking into consideration the following schedule of points: For each section in the schedule of points the best will be graded full and the remainder will be graded according.

The schedule of points will be as follows:

1. Record keeping.....40 points
2. Housing .....20 points
3. Management .....40 points
   1. Methods of feeding....15 points
   2. Handling of eggs.....15 points
      1. Frequency of gathering 5 pts.
      2. Frequency of marketing 4 pts.
      3. Size of eggs..... 2 pts.
      4 Method of marketing... 4 pts.
   3. Egg yield .....5 points
   4. Management of yards, cleanliness of yard and house .....5 points

Mrs. R. Lee Alford, chairman Poultry Dept. of Missouri Home-Makers' Association, Vandalia,Mo.

This is a department from which we have every right to expect great results, for most women of towns and farms are actively engaged in poultry raising.

Through this contest we hope to locate many of our women who are so successfully developing fine strains of all the pure breeds according to their own methods of selection and system of feeding.

All questions of care and feed will be ably answered by experts who are willing to give their valuable assistance to the interest of this department.

We shall be glad to have all enter at once and now is the season to make the trial.

Report of the Rural Improvement Club of Henry County.

By Miss Jessie Ellis Holland, read by Miss Adella Blew before the annual state meeting of the Home Makers' Conference, held in Columbia, Farmers' Week.

During the two previous sessions of this conference, I have come to you as a representative of that well-known rural club—The Country Culture Club of Hudson in (Bates County). This time, however, it is my pleasant task to tell you something about the Country Culture Club's baby—The Rural Home Improvement Club of the Mount Hope community of Henry County, and of what it has been doing since its organization. The inspiration and enthusiasm which we imbibed during the last

Right Now!

The Best Time to Make Money in Poultry

Thousands of tons of meat products are going across the ocean to feed the hungry people of war-stricken Europe. This may continue for several years, and it is easy to see what the effect will be in this country on the supply and prices of meat.

At no time has the promise of profit in Poultry been so sure as now; and no business offers such quick and large returns on a small investment.

***Even if eggs bring high prices in the winter months,* it will pay you much better to turn them into early friers and broilers or laying hens, because chickens grow up on the kitchen and farm wastes in a short time and with little labor.**

Sure Hatch

The Reliable Cold Weather Hatcher

60 Days Trial Freight Paid Catalogue Free

10-Year Guarantee

Is a carefully-built, high-quality machine with a 17-year record of success on thousands of farms.

Its copper hot water heating system, double walls, perfect insulation and automatic heat regulator, will keep the right hatching conditions in any climate, winter or summer—even in a room so cold that water freezes in the drip cup on the side of the machine.

This makes it possible for you to hatch chicks in winter, and with the aid of the Sure Hatch Brooder, bring them to market size early in spring when prices are highest. A single hatch will pay for the machine several times over.

Beginners succeed with the Sure Hatch because it is self-regulating and so well built that it cannot get out of order. There are today thousands of women and children who are helping the family income with a Sure Hatch and who never used an incubator until they bought the Sure Hatch. They are all enthusiastic about their machines and would not bother with hens, which are slow, unreliable, troublesome, and lose a big percentage of the chicks they hatch. THEY PREFER THE SURE HATCH INCUBATOR, because it's easy to manage, economical and successful.

Mrs. Jas. C. Reid of Blunt, S. D., got $63.00 worth of chickens from one hatch. Mrs. Susie McClellan of Litchfield, Neb., cleared $130.71 in one year on a 150-egg Sure Hatch. Our free catalogue gives the experiences of many women. Write for it.

We help you to succeed. Besides sending you full directions for operating the machine, we also send you free with the machine our Uncle Sam Poultry Book, the only book printed that tells how to succeed with poultry, based on official reports by U. S. Government Experts.

We will send your Sure Hatch the day we receive your order — freight paid on 60 days' trial, and under our 10-year guarantee.

You can depend upon fair treatment from us. The thousands of Sure Hatch users who have dealt with us for years testify to our square dealing.

Our Free Catalog which we are anxious to send you merely for the asking, tells all about every part of the Sure Hatch, by words and pictures, so you will know exactly what kind of a machine you will get when the Sure Hatch reaches you.

Don't Delay Get your Sure Hatch started in time to make money the coming Spring. Write a letter or drop us a postal, and will send you our Big Free Illustrated Catalog by return mail.

Sure Hatch Incubator Co.
Box 49 Fremont, Nebr.

Low Price of the Sure Hatch

You cannot afford to waste your time and money with a machine that will not hatch or which will produce weak chicks that cannot live—no matter how low the price. Such a machine is costly at any price. An up-to-date factory producing 100,000 machines a year, we are able to build a high-class machine at a low selling price.

Don't think that our prices are high because we talk about quality. They are not high. They are low, and you will wonder how we can sell them at the prices we do.

Now, don't forget that we want you to send at once for our free book which tells you all about the Sure Hatch machines, and gives you a lot of good suggestions on buying and operating an incubator as well as running the chicken business.

The Sure Hatch Brooder

Takes Better Care of Chicks Than the Hen

The hen is not a good mother as a rule. She loses from 25 to 50 per cent of her brood, before they get to the age when they can care for themselves — from rats, cats, dogs, hogs, vermin, and disease caused by being chilled.

The Sure Hatch Brooder protects the tender young chicks from all these dangers. It is automatically ventilated, maintains the proper temperature at all times. It is strongly built, durable, and costs so little that you cannot afford to do without it.

session of the Home Makers' Conference were such that when we returned home we were more impressed than ever before of the great need of a better social life in our home neghborhood.

Co-incident with this feeling, was the urgent idea kept before us by one of our most earnest workers—that the time was ripe for effecting an organization to put our enthusiasm into action. Acting upon her suggestion, we notified every girl and woman as far as possible in our community that we would meet in a centrally located home on February 10, 1914, for the purpose of organizing a rural woman's club.

Imagine the cheerful response of twenty-nine women at this meeting, and everyone placed her name on the club roster for membership, and two mothers, who were detained at home, sent in their names.

An election of officers immediately followed with a general discussion of plans for our initial year's work. Committees were named at this session to prepare constitution and by-laws for our organization and also the monthly programs for the entire year, which was published in a year-book for the convenience of members. At the first regular session our club was christened The Rual Home Improvement Club. And I would like to say that if you could see the willing effort our women have put forth to better community conditions, you would feel as I do, that they are earnestly striving to personally realize the full meaning of our adopted motto: "The best of myself for the best of others."

We have now held twelve regular meetings and feel that our work of home and community improvement has scarcely begun. At our second session it was decided that a community Sunday school was one of our greatest needs and plans were laid to organize one, which was done on April 5. The building and church lawn being in neglected condition, the men and boys of the community were invited to the church on the afternoon of April 3 to clean the lawn of the rank growth of sprouts and erect hitching racks, while the women and girls gave the building a thorough cleaning. Since then we have had a good, live Sunday School, the record of which shows an average attendance of almost fifty, and good Children's Day and Christmas programs were carried out under the supervision of an able superintendent.

On May 23, the club members and their families enjoyed a day's outing and fishing party which proved to be an event of delight and pleasure to everyone present. The next special feature of our work was a sane Fourth of July picnic to which we invited the Montrose Commercial Club, (this is our trading center about four miles from the church), The Camp Fire Girls, The Young People's Branch of the W. C. T. U. of the same town and all the neighboring country clubs. Two prominent speakers were on the program and each made an excellent address. A good crowd was present and partook of the bountiful feast, which was served to all at the noon hour.

Our club received first premium on the best collection of ten pieces of fancy work exhibited at the Appleton City Street Fair held in August.

It was our pleasure at our regular October meeting to have as our guests, Miss Louise Stanley of the Home Economics Department of the University, also Mrs. Harry Sneed and Mrs. Stevens, president and secretary of that well-known Home Makers' Club of Pettis County. Delightful and interesting talks were made by each, our only regret being that their time with us was necessarily so limited. On the evening of October 21, Miss Frances Catron, a well-known reader and impersonator, gave one of her pleasing entertainments to a good house, at Mount Hope church under the auspices of the club. Not only did we enjoy having a first-class entertainment right at home, but a neat little sum was added to the club treasury as well. In August the club members assisted the Sunday School in giving an ice cream social on the church lawn, the proceeds of which were to be used in placing a new organ in the church building.

On the evening of November 28 a reception was given the members of the club families and a few invited guests. A short program was rendered, followed by the serving of refreshments. On January 6, the club women served lunch at a public sale in the community and thereby added $17.50 to the club treasury. The club and Sunday School have appointed a purchasing committee for the new organ and in a very short time enough money to install a first-class instrument will be in the hands of the committee. Plans ae being laid to have the church building painted in the spring and as soon as the new organ is installed, our finances will be directed to this need.

You see we have done no great things but the little things when taken as a whole, have added a great deal to the welfare of our community. We are better acquainted with our friends and neighbors, our vision is broader, and not the least feature is the newly awakened community interest and pride which has long been dormant, and our outlook for furthering the community's welfare the coming year is very encouraging.

(We hope that every woman who reads the above will catch the inspiration and want to start a community center, for what these women have done others can do; tell us of your efforts, either as an organized club or how you solved your local problems so quietly, we need your methods to help others and broaden our own.—A. K.)

Prizes for Canned Vegetables

Mr. and Mrs. J. Ed Hall of Lamonte, Mo., are offering through the Missouri Homemakers' Conference, a $10 trophy or cash, to the young woman in the state who will most successfully can six jars of different vegetables in pint jars, these cans to be exhibited and scored at the January, 1916, Conference. This is the most liberal offer for culinary product that we have ever seen and fortunate is the young woman who wins it. This offer seems especially to appeal to those young people who have passed beyond the school club—and while the dream home of every normal woman is still in the future—why not improve the present, which is ever full of time and oppotunity, to get the proper training while near mother. We shall be glad to hear from all who are interested and wish to enter this contest; it is full time to start your seeds.

The following vegetables are possible to have on your table the year 'round and yet not have to purchase them from the grocer: Peas, Beans, Spinach, Swiss Chard, or any wild green, Asparagus, Corn, Tomatoes, Summer Squash, Egg Plant, Lima Beans, Okra, Beets, Cauliflower and Carrots.

WARNING AGAINST CANCER

"The only reliable cure for cancer," says the American Society for the control of Cancer, "is its early and complete removal." The Minnesota Public Health Association is campaigning against cancer and Dr. W. H. Hill, the executive secretary will gladly aid any one in doubt by advice or explanation. So important is the subject that the town council of Portsmouth, England, requires the publication monthly of the following information in the local press:

"1. Cancer, in its early and curable stage gives rise to no pain or symptoms of ill health whatever.

"2. In case of any swelling occuring in the breast of a woman over 40 years of age a physician should at once be consulted.

"3. Any bleeding, however trivial, occuring after the change of life, means almost invariably cancer, and cancer which is then curable. If neglected until pain occurs it means cancer which is almost invariably incurable.

"4. Any irregular bleeding occuring at the change of life should invariably be submitted to a physician's investigation. In a large number of cases it means commencing cancer.

"5. Any wart or sore occuring on the lower lip of a man after 45 years of age is almost certainly cancer. If removed at once the cure is certain, if neglected the result is generally fatal.

"6. Any sore or swelling occuring on the tongue or inside of the mouth in a man after 45 years of age should be submitted to investigation without a moment's delay, and the decision at once arrived at by an expert microscopical examination whether it is cancer or not.

"7. Any bleeding occuring from the bowel after 45 years of age, commonly supposed by the public to be 'piles,' should be submitted to investigation at once. A large proportion of such cases are cancer, which at this stage is perfectly curable.

"8. When warts, moles or other growths on the skin are exposed to constant irritation they should be immediately removed. A large number of them, if neglected, terminate in cancer.

"9. Avoid irritation of the tongue and cheeks by broken jagged teeth, and of the lower lip by clay pipes. Many of these irritations, if neglected, terminate in cancer."

Cancer attacks rich and poor, educated and ignorant, careful and careless. Of people over 40, one-eighth among women, one-fourteenth among men, die of cancer. Early operation saves 85 per cent, late 33 per cent, very late, hardly any.

LIGHT, COOK, IRON, WITH GAS

Mrs. Housewife:

Sit down now and just drop us a little note asking that we send you FREE our profusely illustrated booklet telling all about "Gas" and how easily it can be installed in your home.

This booklet starts off by mentioning some of the inconveniences experienced in homes without gas. Then it tells the conveniences of having gas. How every room can be instantly and brightly lighted. How there is no trouble attached to it at all. How a gas range is used in the kitchen instead of a coal or wood range. How gas irons are used for ironing. And how gas contrivances of all kinds lessen labor and save time. After it has covered these subjects very interestingly and fully it says:

"And Why Don't You Mrs. Housewife Have Gas in Your Home"

You can now. There has been a machine invented and patented that enables you to make your own gas even cheaper than "City Folks" buy it. And the gas you make will do everything city gas will do. That machine is the

AERO-GAS MACHINE

Our booklet tells all about the Aero-Gas Machine. But this booklet says so much that we can't begin to outline it here. Why not send for it now. It won't cost you a penny and doesn't obligate you to anything.

Send for that FREE BOOKLET NOW. PLEASE. Address,

St. Louis Aero-Gas Machine Co.

517-519 North 2nd St., St. Louis, Mo.

LET THE BABY CLIMB

Babies and young children tend naturally to practice all those activities that are necessary to the best development of muscles, ligaments and bones. If opportunity is given them and they are permitted to follow their instincts, they will secure in nearly every case full and complete development of the strength, the form and the use of all the fundamental organs and tissues. But—few parents are willing to follow nature's guidance here. We permit our adult desires and fears to govern our control of the child's activities and we over-stimulate some activities and endeavor to prevent others. This is notably true with regard to walking and climbing. The former we encourage and promote in every possible way; the latter we discourage and prevent.

With few exceptions, every child will walk, and that without parental urging or teaching, when his muscular and nervous system has reached the proper stage of development. More injury is done to feet, ankles and knees by over-stimulating children to walk too soon, than by any other cause. This is also a contributing factor in developing adnormalities of the spine, by placing too much strain upon the unsupported back muscles and ligaments before they are sufficiently developed.

Directly associated with this practice is that of discouraging and preventing the child from climbing—"for fear he will fall and hurt himself." Here we take counsel of our fears rather than our reason and do the child an irreparable injury. All children tend to climb before they attempt to walk and, if permitted and opportunity is furnished, are able to climb freely and without fear by the end of the first year. Climbing up and down stairs is a source of unending interest and supreme joy by this time, a great pleasure denied to the child living in the modern tenement or apartment house.

Walking alone is exceedingly limited before the first part of the second year, and steady equilibrium is not acquired much before the eighteenth month, while at that time the child that is not prevented will climb into ordinary chairs and in high chair without assistance. Before the end of the second year ladders are climbed without fear and by the end of the third year tree climbing is acquired.

George W. Ehler,
University of Wisconsin.

A DAMPER ON DISCIPLINE

"Where's that child?" I said, an' went
An' cut a long beech gad an' trum
Branche off, an' rally meant
T' tan his jacket when he come—
Tan it right!—an' learn him not
T' gallivant through all outdoors
'Specially when he knows he's got
T' get the cows an' do the chores.

"Where's that boy?" I says, an' ast
The naybors folks, a'thinkin' they
Might o' seen him goin' past.
An' hailed him when he run away;
Nary hide ner hair they'd seen
No more'n me!—an' law, I stretched
Fingers 'round that limber green
Beech gad o' mine untwell they etched!

"Where's that child?" I ast, an' got
A leetle trimbly, I expeck,
Thinkin' mebbe like as not
He'd fell some-eres an' bruk his neck!
Hunted through the loft an' out
Behind the barn an' down the run,
Places yunguns think about
An' head for when they look for fun.

"Where's my boy?" I whinned an' then
As if in answer there he come
Down the pastcher lane again
An' headin' straight for us an' home—

Steppin' high an' straight an sta'nch
And proud as Grant, as like as not—
An' draggin' from a willer branch
The first horndays he ever caught!

"Where you been?" I says, an' looks
Right in his eyes an' there I saw
Pitchers of the fields an' brooks
An' things a yungun loves! My law,
All my temper left my head.
I throwed that beech gad good an' strong!—
'Stead o' what I'd planned, I said:
'Why don't y' take your pa along?' "

—John D. Wells.

ONE BOY'S SUCCESS

The boy who gets his mind set on growing the best corn in the county or the finest colt or the fattest pig is not going to be led into bad company and bad habits by the idler and loafer who has no particular ambition or aim in life. The picture in this column is that of Oscar Linhart, the champion boy corn grower of southeast Missouri for 1914 who grew 84 bushels and 45 pounds of St. Charles white corn on one acre of land and that in spite of the fact there was no rain on the corn from the time it was planted until in August. About the only remarkable thing about this boy's success is that he won, because aside from using good seed corn and selecting a good piece of land to start with there was nothing unusual in Oscar Linhart's methods of planting and cultivation. But the fact remains that this boy is well started on the road to a successful business career. He has demonstrated to himself and to others that a boy can win if he will try, but try he must before he can hope to win.

For the benefit of our thousands of boys who read The Missouri Farmer we asked Oscar to tell us the story of how he won the prize for the best acre of corn in Southeast Missouri and this is what he says: "I selected a piece of rich creek bottom land for my contest-acre. This land had been in red clover for two years. I plowed it five inches deep on April 23 and then let it alone until May 11 when I double disked and cross-harrowed it. On May 12th I planted it in check rows with a corn checker four feet apart both ways, three grains to the hill. I plowed the corn three times with a two-horse walking cultivator and I left the surface fairly level. The corn did not get any rain from the time it was planted until August. On November 10 I got witnesses to measure off the acre and help to gather and weigh the corn and it made 84 bushels and 45 pounds.

"I got $25 from Scott County for a premium and a special of $50 from Mr. Babcock of Cape Girardeau and $25 at the State Corn Show at Columbia. I got $4 for seventh prize at Columbia for a ten-ear sample. At our show in Sikeston I got third premium on ten ears and then sold 70 ears for $4. I am selling the corn for seed at $2 a bushel and have sold a lot of it already. The cost of producing my crop including rent was $10.17 or a little over 12 cents a bushel. In addition to the above premiums I also received a free scholarship at the Cape Girardeau Normal School. I wish all other contestants success." Oscar Linhart.

We would not want our boy readers to get the idea that it is possible for every body to win in a contest as easily as Oscar Linhart did, but here is the point we wish all our boys could get, and that is, that his success depended on his selection of a good piece of land. The land had been in clover for two years and that helped to put it in good condition for a good crop. If all the corn ground in Missouri could have a crop of clover grown on it one year in three it would probably increase the yield of corn one-fourth more than what it is now. Every boy who would enter the state contest this year can not select a good piece of creek bottom land but he can make his land better by scraping up a lot of the manure that usually goes to waste about the barn yard. It is wonderful what a difference a few loads of manure will make on the yield and quality of a piece of corn. Then the boy who is thinking of going into the contest or of raising corn to sell for seed should begin to plan now for his crop two and three or more years ahead. Arrange to sow some clover this spring on the land that will be used for corn in 1917 or 1918. It takes planning ahead to make a good farmer and every boy who aims to farm at all should strive to be a good farmer. Any boy can make a reputation for himself if he will try to do something a little better than the ordinary fellow is doing it. It will be seen in this case that it was the good reputation that enabled this boy to sell his corn for seed at $2 a bushel or nearly three times what ordinary corn was worth. Any boy can soon build up a business in selling good seed corn if he will learn how to produce good corn then take some of it to the local or state corn show so as to let others know what kind of corn he has. We would like to see several hundred of our Missouri Farmer boys get into the corn game this year and get in to win.

WORTH TWICE ITS COST

A subscriber from Callaway county writes about a water system he installed in his farm home as follows: "As you requested I am writing about our water system which was installed at your suggestion sometime ago. You recommended either a force pump at the well and a tank in the kitchen or a small pump attached to the sink in the house and we chose the latter. The pump cost $5 and I used 50 feet of pipe at 10 cents a foot—$5. Under the pump I placed a sink 18x30 inches which cost $3.50. I used 40 feet of 3-inch tiling for sink drain at a cost of 7½ cents per foot. The cost of the material was the only expense as I did all the work of putting it in myself. So you see for a cost of $16.50 we have a perfectly good water system. Everything about it works fine and we wouldn't be without it for twice the cost.

The alfalfa about which I wrote you was sown on millet land. It was sown with a drill and there was a mistake made in guaging the drill and only half enough seed was sown, and it rained the evening after it was sown so no more seed could be sown at that time. The alfalfa that is on the ground looks fairly well. Would you advise sowing again in the spring followed by a harrow? Thanking you for past favors and with best wishes to you and The Missouri Farmer H. G. Leonard, Callaway County.

Editor's Reply: This shows how cheaply and conveniently a water system can be installed in any farm home. When fifteen or twenty dollars will bring the water right into the kitchen with only a few strokes of the pump handle occasionally and then without the good wife leaving the room the waste water is carried out and away without effort, is it not strange that any farm home should be without this convenience?

Concerning the alfalfa, we would proceed as you suggest. When the ground is in good condition about the first week in April sow the remainder of the seed and give it a good harrowing. This will cover the seed, kill some weeds that are starting and cover the alfalfa at the same time. If the weeds and summer grasses do not smother the alfalfa you may have already a much better stand than you think. If the ground is inoculated and well suited to alfalfa that now on the ground will soon branch out and thicken up the stand surprisingly.

"PIG FEEDING" CLUBS FOR BOYS

After all, there's a right and wrong way to do everything, even to the feeding pigs. And now comes the agricultural extension division of the University of Missouri organizing "pig feeding" clubs for the boys and girls of Missouri.

"The purpose of these 'pig feeding' clubs," said A. J. Meyer, secretary of the agricultural extension work, is to teach the club members how to feed pigs economically to make the most gains at the lowest cost possible. This involves not only right methods of feeding, but right management, so as to keep the pigs healthy. It takes healthy pigs to make cheap gains."

Prizes will be offered for those club members who show that the pigs which they have been feeding have made the most gain.

Boys and girls who desire to enter clubs should obtain at least six members from one school district. If this is impossible, two or three districts may combine. Wherever possible the boys' and girls' clubs are tied up as closely as possible to the county schools. Any person interested in the organization of these clubs may obtain a circular giving complete information, if he will write to the Agricultural Extension Service of the College of Agriculture.

There are now 3423 boys and girls enrolled in the different clubs. There are 288 clubs. Up to January 1 there were 78 corn clubs, with a membership of 1134; 45 tomato clubs, with 508 members; 102 sewing clubs, with 1072 members; 50 stock judging clubs, with 561 members, and 13 poultry clubs, with 148 members. Since January 1, there have been 17 clubs organized with a membership of 188.

Can You Use Him?

I want to rent a good farm on shares—or I will take charge of a farm and run it for the owner under any fair arrangement. I am at present living in town. I have several boys big enough to do farm work and want to get them away from the city. I was raised on a farm and know all about farm work. J. E. Hackley, Columbia, Mo.

Stockfeeders, Attention

Elsewhere in The Missouri Farmer is the advertisement of the Chocktaw Sales Co. of the Live Stock Exchange Bldg., Kansas City, Mo., who are advertising Cotton Seed Meal and Cake, Linseed Meals, Molasses Feeds, etc. This is a reliable concern and if you are needing anything in their line, drop them a postal card and ask for full particulars.

My, what a great farm paper we could give our readers if all would renew their subscriptions promptly.

Save $50 on your Silo

Don't buy or **agree** to buy any **Silo** of anybody till you get our latest Folder with special **direct-from**-factory prices.

We positively and absolutely guarantee to save you $50 to $100 in spot cash, depending upon the size you want.

You save $50 first because you pay no agent's or dealer's profit; second, because you buy from one of the biggest Lumber and Building Material Houses in America, **and NINETY PER CENT of a Silo is LUMBER.** The wood Silo is not an experiment, it has been tried out and found satisfactory.

Every Gordon-Van Tine Silo is genuine, **Clear Oregon Fir,** a wood that the U. S. Forest Service says is the **strongest** and **longest lived.** And we use **one-piece** Staves only—no spliced two piece staves to open up and ruin ensilage. It is the only stave that can be used any side, in or out.

Has New Adjustable Wall! **All hoops are tightened from the ground. No guy wires needed!**

No doors or door frames to weaken the structure, or warp and get out of shape, but instead is a **real modern** construction.

A Silo with framework as solid as **Steel,** none stronger. **Built like a city "Skyscraper."** Impossible to creep off of the foundation, is the easiest Silo on the market to erect.

The Gordon-Van Tine roof allows you to put more ensilage in our Silo than you can in any other Silo of a like diameter which is four feet higher. Sold under a written guarantee of **satisfaction or money back.** Prompt delivery guaranteed, no matter where you live. We make quick shipments of silos direct from Davenport. Send for complete, illustrated Folder showing many advantages. Then compare with other Silos you know. Remember we unqualifiedly **GUARANTEE** to save you **FIFTY DOLLARS** in real money.

Can you afford to choose a Silo till you have seen what a genuine bargain we have to offer? If you write NOW, you will receive complete details by **return mail.**

GORDON-VAN TINE CO., 5702 Case St., Davenport, Ia.

Largest Factory-to-Farm Lumber and Building Material House in America.

FARMERS NEED CHEAPER MONEY

Part of an address delivered by William C. Brown before the recent Farm Congress, St. Joseph, Missouri.

"As a Nation we are just awakening to a realization of the fact that agriculture, the cultivation of the soil, is the real basis of all wealth, the great center from which radiates every other avenue of human endeavor. We are just beginning to appreciate the fact that, unless agrculture progresses and prospers, no other business can hope for substantial prosperity.

For years the production per acre of the farms of the United States has been compared with that of Germany, France and England, and we find the average varies from one half to two-thirds that produced on the other side. In these countries, on land which has been cropped for a thousand years, the annual yield of wheat per acre is more than double that produced from the comparatively virgin soil of the United States, other crops in about the same ratio.

In explanation of this it has been argued that for generations vast reaches of fertile uncultivated land, constantly beckoning to the eager pioneer, resulted in depressing the price of the products of the farm to a point which afforded no margin of profit, if, indeed, it equalled the actual cost of production. Hence there was no reason or incentive for stimulated production by improved methods or by the application of scientific knowledge to farm operations.

Increase in population has overtaken production, and, if the present rate of increase continues, we shall, by the middle of the present century, have in this country two hundred million mouths to feed.

We are producing at the present time approximately six hundred and fifty million bushels of wheat per annum. [This year the crop was estimated 891,017,000 bushels, the largest on record.] By the middle of this century, or within thirty-five years, this production must be doubled, or we shall lack bread for our own people. With the extremely limited opportunity for increasing acreage, the only way, by which this condition can be met, is by bringing the production per acre of our farms up to that of England, France and Germany, and we cannot hope to accomplish this unless we give to the farmers of this country (insofar as it is possible to do so) every advantage enjoyed by the farmers of those countries. As compared with the farmers abroad, our farmers labor under two very distinct and burdensome disadvantages.

First, in the supply, efficiency and cost of labor.

Second, in securing capital absolutely necessary to achieve the best results from the operation of their farms.

From the handicap of less efficient and more expensive labor, I can see no practicable relief, but it does seem entirely practicable, by wise constructive legislation, to remove the great handicap imposed by the extreme difficulty of securing necessary capital on terms which will make possible its most efficient and beneficial use.

Twelve million famers in this country are adding each year approximately ten billion dollars to the wealth of the Nation.

This is being done on a borrowed capital of about six billion dollars, on which an annual interest of about five hundred and ten million dollars is paid. Statistics show that, counting commissions, renewal charges, and other expenses, the average rate of interest paid by the farmers of this country is about nine per cent, as compared with a rate of three and one half to four and one half paid by the farmers of Germany and France. It has been well said that "the soil is the ultimate employer of all industry, and the greatest source of all wealth."

The credit of the railroads, their ability to earn a return on the money invested in them, depends upon the success of agriculture and yet, while railroad securities have, under normal conditions, found a ready market on a four per cent basis, and the same is true of municipal and, to a great extent, of industrial securities, the farmer who has funished the real basis for the credit and the prosperity of all, has been compelled to pay double the rate of interest for money with which to purchase and improve his farm. The reason for this, or at least one great reason, is the fact that the railroads, the municipalities, and the great industrial concerns have at their command the machinery, or organization, which enables them to offer the public a security more readily negotiable or liquid than the farm mortgage.

The work of bringing a farm to its highest state of fertility and efficiency involves years of expenditure of labor and money, and thousands of intelligent, progressive farmers, who know exactly what is required to produce this most important and desirable result, are deterred from using their knowledge and enterprise by the dread of the shadow of a mortgage, on which a high rate of interest must be paid semiannually, the principal becoming due in from three to five years.

This great question is being considered by thoughtful men, and is finding a place in the platforms of several political parties. In a letter written by President Taft, under date of October 11th, 1912, to the Governors of the States, and speaking of the necessity for providing a better system of Agricultural Credit by creating the machinery necessary to make farm mortgages more liquid and more easily negotiable, he said:

"The value of this assistance to the farmer receives unquestionable testimonial in the growth of the system in the countries of Europe. But the advantages to be gained by the adoption of this plan go beyond the direct saving in interest to the farmer. The great necessity which prompted the establishment and extension of this plan throughout Europe was that of checking the rapidly advancing increase in the cost of foodstuffs, brought about by the inevitable increase in consumption and the failure of the long drained soil to afford a corresponding increase in production. That problem faces the people of this country today—not in so severe a form as it threatened the older countries of Europe, but, still as a great and pressing economic problem."

In a paper addressed to Congress in August, 1913, President Wilson earnestly and eloquently advocated action in behalf of Farm Credits. In this paper he said:

"There is no subject more important to the welfare and industrial development of the United States.

One of the chief, and most serious disadvantages has been that the farmer has not been able to secure the extended bank accommodations he every year stands in need of, without paying a most burdensome rate of interest, and saddling himself with mortgages and obligations of various kinds under which he fairly staggered, if he could carry them at all.

In other countries systems of Rural Credits have been put into operation which have not only relieved the farmer, but have put his enterprises upon a footing of easy accomplishment. The countries in which agriculture was steadily languishing, because it was wholly unprofitable, have seen their farm lands blossom again and their people turned once more to the soil for a living. Our farmers must have similar means afforded them for the handling of their financial needs easily and inexpensively. They should be furnished these facilities before their enterprises languish, not afterwards—and they will be. This is our next task and duty."

MISSOURI'S DAIRY INDUSTRY

The following paragraphs are taken from recommendations and suggestions made by the State Dairy Commissioner, E. G. Bennett, to the State Board of Agriculture. Mr. Bennett makes some good, wholesome suggestion that we commend to those who are engaged in the dairy business.

A few years ago practically all of the butter sold in Missouri was made on the farm. The coming of the cream separators and the establishing of large central creamieries that make a market for cream products in sections that have no local creameries, have greatly reduced the amount of butter made on farms and there are sections of the state where at certain seasons of the year, it is impossible to find country butter for sale, due to the selling of butter fat to the creameries. There is far more work attached to making butter than in operating a separator, and the reduction of labor in this connection and the ready market for cream has had much to do with stimulating the industry, causing many to increase their herds and others who were not milking cows, to engage in the work. The use of the silo, providing a cheap and succulent feed, the employment of better barn equipment and the ready market at profitable prices for all surplus dairy stock, has contributed largely toward making dairying more popular and causing the industry to grow. The untiring efforts of the dairy department of the Agricultural College along educational lines, reading of good farm literature, the publicity and information given to the farmers at institute meetings throughout the state, bringing to the minds of the business men through commercial clubs and other sources, the importance of encouraging the farmers to milk more cows, have no doubt been the strong factors in our dairy development.

Average Production Not Sufficient

There are many dairy cows in Missouri capable of making meritorious producing records. But the production of the average cow is entirely too small, and since success in dairying depends so largely on her we must increase the production of the average cow. If all those engaged in dairying in Missouri realized the importance of this and made special efforts for greater results, it would mean hundreds of thousands of dollars added to the present output annually. It is estimated that the average dairy cow in the United States produces 150 pounds of butter fat per year. The records show that 30 cows of the different dairy breeds have each produced around 1000 pounds of butter in a year. There are many cows over the country that have more than 500 pounds per year to their credit and entire herds with individual averages of over 400 pounds per year. So if the average is but 150 pounds, there must be many cows producing less than this amount. Dairying is the principal business in Denmark. Twenty-five years ago they were producing annually about 120 lbs. of butter fat per cow, through the application of business methods, their average production has increased to 240 lbs. per year, and they started with a beef breed of cattle. Surely this shows us a large field for labor. According to figures based on the federal census of 1910, Missouri has over 800,000 milch cows, many of these are pure bred and registered, and many grades carry a large percentage of pure blood, this would indicate that we have a much better class of cows with which to increase our average than did the Danes. An increase of 5 lbs. of butter fat per cow per year would mean more than one million dollars additional to the dairymen's income of this state annually, this and greater increases can be accomplished by those engaged in this work at little if any more expense.

How to Increase the Average Production

In order to make dairying profitable, attention must be given to details connected with the work. Economic production of feeds is first among the details to be considered. Dairy products are bringing good prices and we cannot hope for them to go much higher and we must realize that if the prices go too high the consuming public will seek a substitute. So we must study the economic questions of dairying, for increased profits. Close study of the feed problem will decrease the cost of feed and increase the production of milk. Clean and comfortable quarters are advised, cows will respond to good or bad treatment. The milk scale and Babcock test must be employed, in order to know the profit or loss. Sum up the cost of her feed and the value of her product and her worth is easily determined. Through the use of this method one can have all his cows paying a profit, rather than take the earnings of the cows that pay, to feed those that are being kept at a loss. Require a fair standard of production, and after giving all the cows an opportunity to make good, dispose of those that do not meet requirements.

Better Breeding Essential

While all those engaged in dairying cannot have registered herds, on account of the growing demand for better blood and the increased prices paid for pure bred stock over grade stock, it is advisable to constantly strive to improve the breeding of the herd, and when new blood is introduced, know that it comes from ancestry of merit. It should be the desire of every breeder to raise calves that are superior to their ancestry. The pure bred stock, through tabulated pedigrees, can be authentically traced for several generations and enable one to breed intelligently, while grades are not recorded, and their ancestry are usually unknown. In building up the herd it is advisable to keep the heifers from the profitable cows and use sires from the most productive ancestry obtainable, keeping in mind that animals of good type sell readily and for more money than those whose appearance is not typical of the breed to which they belong.

Local Associations

Believing that the details mentioned are most important in the advancement of the dairy industry, and that keeping these matters before those engaged in the work, tend to stimulate and increase interest, this department has encouraged the organizing of, and has assisted in the organizing of several local dairy associations. I find these associations arouse a co-operative spirit, questions of interest are freely discussed, and result in the members buying feeds, seeds, etc., together at considerable saving; discussions on breeding, feeding and selection of animals are indulged in, and where activity is shown among the members of these associations, decided improvement follows. Some of these organizations contemplate holding association sales the coming year; these sales no doubt will result in the cattle sold being replaced with better bred and more productive stock. I have addressed sixty-seven meetings during the year, in various sections of the state, and invariably advise that local associations be organized. Many of these meetings have been with commercial clubs. The business man readily sees that developing the dairy industry in his community means more cash customers and an increase of business. More commercial clubs should be made familiar with what dairying will do for community betterment.

A Marked Increase in Pure Bred Stock

The bringing to Missouri the past year of more than a fourth of a million dollars worth of pure bred registered dairy cattle is worthy of attention. Many of these cattle are of the best and most fashionable blood of the breeds they represent, and the breeders of the State are to be congratulated for having added such splendidly bred animals to their herds. The breeders of Jackson County alone have expended more than $100,000 for pure bred stock the past year and boast of some of the finest herds of Jersey cattle as well as some of the best equipped dairy farms in the United States. This county is headquaters for the Southwest Jersey Cattle Breeders' Association, and the rapid increase of well bred dairy stock in this community is due to the activity of the members of this association. Jackson County is already recognized as a dairy center, and breeders from other states are seeking location in that section. It has been my pleasure to meet with this association on several occasions. The spirit of co-operation and progressiveness manifested at these meetings, will make Missouri a great dairy state. This association had arrangements made to hold its second annual dairy show in connection with the Royal Stock Show in Kansas City last fall, but this was declared off on account of the outbreak of foot and mouth disease. The outlook for this show was most promising, as the increased entries of stock and the program as arranged assured a most successful show. The association has decided to have these shows annually, and they will, no doubt, be very helpful in further developing the industry in that section. The members of this association are all Jersey cattle breeders. It is hoped the breeders of the Holsteins and Guernseys will make further effort to popularize those breeds in this state. They have long ago proved themselves worthy of the position they hold in the dairy world and should be in more general use in Missouri. Exhibiting dairy stock at our state fair by Missouri breeders would surely be worth while. The many pure bred cattle brought into the state the past year should cause these breeders to advertise their surplus more extensively at home, and our state fair offers splendid opportunities for those desiring to advertise and popularize their herds.

Farmers interested in fertilizers should get in touch with Darling & Co. whose advertisement appears elsewhere in this issue. They can give you a lot of useful general information which is free for the asking.

The Jersey

comes into maturity early, is long-lived and is often found making records even to advanced age. She stands above all other breeds for *economic production.* Shall we mail you free a good book on the Jersey?

THE AMERICAN JERSEY CATTLE CLUB, 324 W. 23d St., New York City.

STOP DISTEMPER AT THE START

(6)

Distemper and all similar head and throat diseases in horses, sheep and dogs, are caused by contagious germs. Stop the disease at the start, kill the germs with a bottle of

CRAFT'S DISTEMPER REMEDY

For 22 years Craft's has been sold on a positive guarantee to cure Distemper, Influenza, Epizootic, Pink Eye, Coughs, Colds, Shipping Fever and Catarrhal Fever, or your money refunded. Craft's is not only the **BEST**, the **SAFEST**, the **QUICKEST** and most **CERTAIN** remedy on the market, but it is also invaluable as a preventive. Even if your animals are not sick at the present time, if you are wise you will get a bottle of Craft's at once to give to your horses as a preventive. It will drive out the germs, tone the blood, re-invigorate the appetite and put your animals in a first-class healthy shape. Buy a $1.00 bottle today and safeguard your animals from disease. Small trial size bottle, 50c. Your dealer has it or can get it for you. Be sure to get the genuine. Imitations are never so good. Remember, you take no risk—**YOUR MONEY BACK** if it fails.

VALUABLE HORSE BOOK FREE

A Practical Veterinary Book. Tells how to cure all the common diseases of horses. Of value to every farmer, stockman and horseman. Write for your copy today. A postal brings it by return mail.

WELLS MEDICINE CO.

I'll RID YOUR STOCK OF WORMS — I'll PROVE IT BEFORE YOU PAY

I Want You To Know The Value of SAL-VET

(219)

I want you to feed it at my risk—I want to prove to you on your own farm that SAL-VET will rid your stock of worms—put them in healthy condition—easier to keep on no more feed—more profitable in every way, and less liable to disease. I don't want you to send me a penny in advance—just mail the coupon. I'll ship the SAL VET just as agreed—no money down—let you feed it 60 days—and if it does not do what I claim, then I'll cancel the charge. Is not this a fair, open offer?

SAL-VET

The Great LIVE STOCK Conditioner

is the medicated salt which contains no antimony; is fed without trouble; no dosing or drenching. All animals need it—take to it readily—and so doctor themselves. You will find animals that you do not suspect of having worms, just full of them. Stock fed on SAL-VET grow thrifty and profitable, do better, act better, and are in better shape to resist disease.

The Great WORM Destroyer

"I enclose check in payment of the SAL-VET sent recently. Four times this sum would not begin to pay for the benefit I derived from feeding SAL-VET."—W. H. WALLACE, Franktown, Va.

"I am feeding SAL-VET to 750 lambs and about 100 hogs. During this time there has been no sickness whatever among this stock. I consider SAL-VET cheap insurance."—THOS. J. LILLY, Wheeling, Mo.

"SAL-VET is certainly a great medicine. I have been feeding it all winter so far; since I started my stock are better than ever before."—ALBERT MEANS, WALTHILL, Nebr.

PRACTICAL FARM PAPERS—No. 5

A local paper tells of dogs killing nineteen out of twenty-three ewes which were in a small lot near a barn last week. Two weeks ago I read in a Louisville, Kentucky, paper, of thirty-eight head of sheep, chased by dogs, jumping over a precipice into the Kentucky river, all being killed. Estimating the average value of these fifty-eight sheep at $5 each, it would take all the benefit of dogs a good many years to pay the bill.

One of my near neighbors lost $100 worth of stock last spring from rabies, they being bitten by a stray dog that no one could identify, but that neighbor got that dog.

We have not as many dogs in this country as we had twenty years ago, but there are still too many to make sheep raising anything but a very precarious business.

There is a dog law in this state, $1 per year on every dog and $2.50 per year on females, the dog tax going into a fund to pay for dog-killed sheep.

As a rule the females are kept by tenant farmers who pay no tax, and this class also keep 75 per cent of all the dogs in the country, but as few sheep as are kept, the 25 per cent collected on the entire dog population is usually enough to pay the losses sustained.

To my mind, the best dog law would be one taxing male dogs at least $[illegible] and females $25, the assessor to collect the tax or leave the dog dead on the owner's premises. Friend Laughlin's plan of neutralizing the dog and sawing off his tusks, might answer in some cases, but I have a very vivid recollection of killing just such a dog some thirty years ago, just after he had torn up three fine ewes.

The worst winter since 1865 has taught some Ohio farmers the necessity of getting in a full supply of corn, rough forage, coal and wood before bad weather comes. Personally, we got in nearly all the corn crop, all in fact except a few acres of the late planting, and put 160 shocks, 144 hills each, of corn stover, in the barns. Then we hauled in more stover whenever a good day came, so February 1 finds us with a full month's rough feed in. "The boys" insisted on getting an extra load or two of coal, and while I did not favor this very much I let them go ahead, and now I am glad that we do not have to hike out and haul coal three miles over icy roads.

One or two neighbors were afraid that corn would not keep, so they put off getting a supply in, and the coldest days of the winter I have seen them out digging frozen corn shocks from under the snow.

We have kept the manure hauled out closer than usual, spreading it on the land intended for corn this year. It beats the world how a good spreader does encourage a man to keep the manure hauled out, and we also find that it encourages us to try to make more manure. Since we have the spreader, we do not find that the problem of corn stalks in the manure is a serious one, which a recent contributor suggests as an argument in favor of shredding, in fact I cannot see that the stalks are in the way at all except in loading up, and they certainly do make a good amount of humus.

Wheat is small but looks well under the snow. I have a small wager with a friend who thinks that wheat will sell at $1.50 per bushel at the machine in July, and I hope that I will lose it.

There is no disease among live stock here, and very little sickness among the people. Our State Legislature is in session, and that is really the only thing we have to stand in fear of at the present time. Corn is 80 cents a bushel, hogs $6.60 per cwt., butter 25c a pound, eggs 27 cents a dozen, hens 13 cents a pound. C. D. Lyon.

SEED CORN AND SOY BEANS

Boone County White Corn, Ebony and Mammoth Yellow Soybeans; also Cowpeas. Only strictly new, first-class seeds handled.

G. H. Morthland, Molino, Mo.

Johnson County White SEED CORN

The greatest drouth resistant and heaviest yielding variety of corn grown. My seed was from the originator's prize winning stock; cost me $10 a bushel, and what I offer was all in the crib before freezing weather.

Price extra select crated ears, $5 per bu. No. 1 Shelled Seed. $3 per bu. $5.50 per two bushel bag.

Only my own growing and selection. Better order early.

Market the Milk

Raise your calves for beef, and get the bigger money to which you are entitled. But do not feed the calf whole milk, with butter fat worth $600 a ton.

You can sell all the mother cow's milk or butter and make your calf pay you 200% profit on its feed, by raising it on

RAISE YOUR CALVES WITH BLATCHFORD'S CALF MEAL

Blatchford's Calf Meal

The Recognized Milk Equal

You get 100 gallons of rich milk feed from 100 pounds of Blatchford's Calf Meal, and it costs you only one-fourth as much. It will make your calf grow faster.

Blatchford's Calf Meal is composed of all the elements the young calf needs in the most trying period of its life; is thoroughly steam cooked—prevents bowel troubles and other ills due to improper feeding.

Blatchford's Pig Meal insures rapid, sturdy growth of young pigs at weaning time. Prevents setback.

Write us for our Free Book on "How to Raise Calves Cheaply and Successfully Without Milk."

Blatchford Calf Meal Factory
13 Madison St., Waukegan, Ill.

L. C. Beard, Hagerstown, Md., writes: "I can say Blatchford's Calf Meal will pay anyone 100 Pct. that has calves to raise." 2

WINTER CARE OF EWES

The winter care of the flock is just as important as the careful cultivation of the corn crop. This is the growing season of the lamb crop to be harvested in the spring.

The Food: The condition or the amount of flesh the ewes are carrying must guide the feeder. Ewes in good condition need not be fed grain until about a month before lambing, when they should gradually be accustomed to it. Ewes in thin or poor condition should receive from one-fourth to one-half a pound of grain. Straight corn is not the best grain ration. The grain feed should contain some of the blood and muscle building material. A ration of 6 parts corn; 3 parts wheat bran; 1 part linseed oil cake, by weight, has proven very satisfactory at the Missouri Agricultural Experiment Station. A ration of corn, oats and bran, equal parts by weight, can also be recommended.

The sheep should receive as much clover or alfalfa hay as they will eat. The amount of hay eaten can be cut down by use of corn silage or corn stover. Two pounds of clean, sweet corn silage can be used to replace about one pound of hay. Well cured corn stover is also relished by the ewes. Ordinarily there is little danger of the sheep eating too much of it if hay is fed once a day. The greatest danger of corn stover comes from making it the exclusive feed. Under this condition, compaction with other attendant troubles will often result.

Clean salt and water should be kept before the flock.

Sheep should always have a dry, well-bedded floor to lie on.

The flock should have sufficient hay rack and grain trough room so that all can eat at a time without excessive crowding. A complete report of the work done by the Missouri Experiment Station with breeding ewes is found in Bulletin No. 120.

Howard Hackedorn.

TUBERCULOSIS IN CATTLE

From a very comprehensive report by the State Veterinarian, Dr. D. F. Lucky, to the State Board of Agriculture, covering the work for the last year. We print the following on the work of controlling tuberculosis in cattle.

During the first three months of the year, Drs. Tuck and Brown devoted their time to testing cattle for tuberculosis and superintending the tests about Kansas City and St. Joseph, which were made by private veterinarians under the requirements of the city ordinances of those cities. Some sixty-five competent graduate veterinarians in the territory surrounding Kansas City and St. Joseph were supplied with our official tags, blanks, and tuberculin. All this testing was done under the supervision of Drs. Tuck and Brown. The veterinarians who took part in this work were called together and given instructions in regard to the administration of the intradermal test, the insertion of tags and making of reports. It was positively understood with each of them that whenever a reacting animal was found in any herd, the matter should be immediately reported to Dr. Brown or Dr. Tuck. Forthwith, all reacting animals were quarantined, the premises disinfected and provision made for the disposition of diseased animals. In due course of time an official retest of the herd was made without further expense to the owner.

During the year, we have tested officially or supervised the testing of 1601 lots containing 19,334 head of cattle. We have found one or more tuberculous animals in 113 herds. A total of 393 head were condemned. Of this number, 343 head have been slaughtered and 50 head remain in quarntine for breeding purposes. Of the 343 head which have been slaughtered, 318 showed lesions of tuberculosis. We believe that all herds in which the disease was found have been left clean with the exception of those herds which have not received the usual retest. Considering the number of cattle tested, the number of head showing no lesions, and the number of diseased cattle which we probably failed to pick out, we feel safe in saying that we have not made more than two errors to the thousand head of cattle tested.

NOTES ON FARMERS' EXCHANGE

Our files are filled with a superior grade of farm seeds which we can furnish from numerous points over the state direct to you. Whether you are a member or not you should write us for a list of our members who have something to sell. It pays to buy seed close to home for many reasons. Our plan furnishes you seed near you and acclimated. We can furnish you **Seed Corn, Seed Oats, Cow Peas, Soy Beans, Clover, Timothy, Alfalfa, etc.**

We also have a good list of breeding stock. If you desire to purchase a **Stallion** or a **Jack** or work stock, we can suit your needs.

Farmers Needing Efficient Labor.

We can furnish men to do the most practical sort of farm work. Many of these men are trained here in the Short Course in Agriculture as well as on their home farms. These men are capable of taking charge of your work when you are away. Some of these men are ordinary men wanting ordinary positions, but many of them are competent to take up work with men who realize the value of really efficient labor. Write us now and we can put you in touch with a man who will suit you and be on the job March 1 or later if desired.

We will send information or answer questions about any of the above articles our members have, if you will express your desires.

Missouri Farmers' Exchange.
Columbia, Mo.

Preparing a Good Seed Bed

Thoughtful farmers are beginning to realize more and more that a good seed bed is absolutely essential to the production of a good crop—and in the preparation of such a seed bed, good plows are highly necessary. If you are now using old worn out plows we would suggest that you drop a postal card to the Rock Island Plow Co. at Rock Island, Illinois, or the Janesville Machine Co. at Janesville, Wis., and ask them to send you their literature. You will find it full of useful information.

The Flexible Movement of the Spade in Plowing

When you drive a spade into hard ground, you sort of "wiggle" it around between each push. It seems to go down easier—you remove the resistance of clinging soil.

It is this principle that we have succeeded in getting into Janesville Plows. Our object was to lessen the pull on your team and turn a neater furrow. The S. & S. auger twist mouldboard glides through the soil with a flexible movement. This flexibility is possible only in a single bail plow like the Janesville. The plow bottoms have just enough movement in the frame to ease the *pinch* at the point of the share and its cutting edge. This takes the hard work out of plowing. The furrows shave off clean—the finished field shows a skilful job.

JANESVILLE PLOWS

Manufacturers of Farm Implements

With S. & S. Auger Twist Mouldboards

were used by the winners in the plowing matches at Big Rock, Wheatland and Grant Park, Ill., in 1914. In every contest the winner had to show the best work. Our plow was thoroughly tested — 12 good farmer judges pronounced it superior to 21 entries of other plows made by 5 companies.

Janesville plows left the depth and width of the furrows uniform—buried all trash and stubble, broke up the ground thoroughly—left the surface smooth and clean.

Why not do your spring and fall plowing this year with the Janesville flexible S. & S. bottom? Save your team—why pull a plow bottom set solid in the frame? Get the spade movement into your plowing and sidestep hard work.

Write for Literature

and let us tell you more about this construction. Let us send you our book of photographs of good plowing that has taken prizes. Write today for literature on Janesville Plows, Harrows, Disk Cultivators and Corn Planters.

Sale of Percherons and Jacks

A. S. Mercer, Rayville, Mo., will hold a public auction at his farm at Knoxville, Ray county, Thursday, February 25. Included in the sale will be Percheron stallions; four extra good acks, and five jennets. Particulars may be had by addressing him at Rayville, Mo.

Swine Breeders Endorse Legislation

A letter to The Missouri Farmer from R. L. Hill, secretary of the Missouri Duroc Breeders' Association contains copies of resolutions which endorse the following bills before the General Assembly of Missouri.

The Duroc breeders are all progressive Missouri farmers and they no doubt express the sentiments of a majority of the farmers of the state.

They favor the enactment of a law to prevent the sale of adulterated seeds.

They favor an appropriation of $85,268 to meet the Federal appropriation for Agricultural Extension Work among farmers.

They favor the passage of a law requiring the registration of stallions used for service in Missouri.

They favor a law providing for the inspection of commercial feed stuffs. All these laws to be placed under the supervision of the College of Agriculture.

They favor a law that will protect the sheep owners from the ravages of dogs.

Percheron Stallion at Public Sale

Attention of our readers is directed to the advertisement of the Salisbury Percheron Horse Co., Salisbury, Mo., announcing that on Saturday, February 20, they will sell at public auction their good stallion, Albert 48238.

Here is an opportunity to buy a good stallion at your own price.

Adenhill Durocs

R. L. Hill is advertising a choice lot of Duroc fall pigs,—either sex, sired by the prize winning boar, Col. Wonder II. This is a thrifty lot of pigs and are being sold very reasonable. Write Mr. Hill for prices.

Sheley and Clatterbuck's Bred Gilt Sale

Wednesday, February 24, Sheley & Clatterbuck will sell fifty head of high class Durocs, consisting entirely of fall yearlings and spring gilts. This is the second sale made this year by this well known firm, and this particular sale is an event of more than ordinary interest.

In former issues we have given considerable information concerning this herd, but for the benefit of those who are not familiar with the above firm we will say that this herd represents one of the choicest collections of Durocs to be found anywhere.

It was founded on the right principles and has always been kept up to the high standard. Breeding stock from this farm will be found in practically every good herd in the country, and whenever Messrs. Sheley and Clatterbuck have entered the show ring they have been consistent winners.

At the head of the herd are the four boars, Beauty's Model Top, Instructor, S. & C's Valley Chief and Col. Prim. The first two boars are grand champions, Beauty's Model Top holding the honor of winning the grand championship at Sedalia two years in succession, and Instructor was grand champion at the Illinois State Fair in 1912. S. & C's Valley Chief was the first prize aged boar at Sedalia last year, and was the choice of many for champion. Col. Prim has never been shown, but has proven his ability as a sire. We know of no herd containing four as good boars as the ones named above. The brood sows, the dams of the offering, represent the very best of breedin gand individuality.

The entire lot to be sold are sired by one or the other of the four boars mentioned, and are bred to them. Included in the sale are a number of Missouri State Fair prize winners, and all are bred practically the same as the successful show herds exhibited by this firm.

It is hardly worth while to go into detail about the many attractions cataloged. Breeders and farmers will have no difficulty in finding what they want. However, we will mention a September yearling, Carnation, by S. & C's Valley Chief. This good young thing is a litter mate to the boar, Sensation Chief that was shown last year, and she has a show record herself. Carnation is out of a Beauty's Model Top dam, and therefore represents the very best cross ever made in this herd. This gilt is easily one of the best things that will be sold this year. She has plenty of size and bone, and quality to please the crankiest crank. Anyone looking for something extra good will not go wrong on this lady. There are a number of other very choice things listed—just the kind you would expect to find in a Sheley & Clatterbuck sale and we take pleasure in recommending this sale to our readers.

This sale will follow Chas. L. Taylor's Col. Wonder sale at Olean on Tuesday, February 23,, and on Thursday, the 25th, C. C. Boyd will disperse his herd of

A.V. Rowe Pres.

TRY This HOG OILER 30 Days At My Risk FREE

SEND NO MONEY

If you will write and tell me how many hogs you have I will send you at once, all freight charges paid, as many of my New Idea Hog Oilers as you want to try and one gallon of Medicated Oil free with each Oiler. You can put them up in your own hog yard and let your hogs rub against them 30 days at my risk. If you don't say my Oilers are the simplest, safest, most durable and most economical Hog Oilers on the market, and the best investment you can make for your hogs I will pay the return freight charges and not ask you to pay me a single penny either for the use of the Oiler or for the Oil consumed.

ROWE'S NEW IDEA HOG OILERS

have no valves—nothing to get out of order. Stock can't break them. Dirt can't clog them. Oil can't be wasted. Rain can't wash out oil. Every drop is applied as needed **right on the itch** when the hog rubs. Pigs of all sizes and ages can rub on these Oilers and keep themselves vermin-free, mange-free and healthy. Three rubbing bars on each Oiler. One Oiler accommodates 30 to 50 hogs. Uses either crude or Medicated Oil. **Helps prevent hog cholera.** Keeps animals comfortable, contented—and they put on flesh faster—make you more money.

I'll Furnish the Oilers—I'll Furnish Oil—I'll Pay the Freight

Prove these claims at my risk on your own farm before you pay. Just write and tell me how many Oilers you want to try. Send no money. Order direct from this advertisement or if you prefer write for big illustrated folder today.

Alvin V. Rowe, Pres., ROWE MFG. CO., 101 Liberty St., Galesburg, Ill.
Also Makers of Famous CAN'T-SAG Gates

Save $2 to $12 on Each Oiler at these Cut Prices, Pay if Pleased

1 Oiler	$ 7.75
2 Oilers	15.00
3 Oilers	21.75
4 Oilers	28.00

1 Gal. Medicated Oil Free with each oiler. If you wish to send check with order deduct 25c for each Oiler ordered. Money back if not satisfied

Caldwell's Annual Duroc Sow Sale

Saturday, February 27th., Milan, Mo.

FORTY BRED SOWS AND GILTS

My sale this year will include the best lot of sows and gilts that I have ever offered the buying public. The offering represents the blood of such noted boars as **KING OF COLS. II, PRINCE OF COLS., BIG BUDDY CLIMAX** and others. Send for catalog.

T. E. DEEM, Auctioneer.

C. D. CALDWELL - - - - Milan, Mo

Percheron Stallion
This horse is pure bred, five years old, coal black, will weigh a ton, and is a sure foal getter. No horse in the state can show a better lot of colts. Will sell cheap.

J.H. Crosswhite, - Waverly, Mo.

Percheron Stallion for Sale. Good breeder and good style and action. Will sell at bargain. C. W. Garhart, Salisbury, Mo.

Percheron Stallion for Sale.—Percheron Stallion, sired by Grigsby's imported stallion; dam, a good Percheron mare. This is a high class grade stallion, good bone, sure foal getter, fine colts. He has the colts to show and will be sold worth the money. This ad. will appear but once. Inquire of William Hanecy, St. Joseph, Mo., 518 Francis St. 2151

BARRED ROCK COCKERELS
I have a few choice birds and will make very low prices on two or more to one customer. Also anything you want in Jersey cattle.

J. B. SMITH, Platte City, Mo.

PUBLIC SALE

We will sell at public auction on Saturday afternoon, February 20, 1915, our dark bay Percheron stallion ALBERT 48238.

Salisbury Percheron Horse Co.
Salisbury, Mo.

Registered Percheron Stallion
Registered Percheron Stallion, five years old; black. Weighed 2020 pounds as a three-year-old. Good breeder; can show colts. Will sell at a bargain or trade for a high class jack. Must have large bone and foot, and measure 15.3 to 16 hands, standard, good head and ear. Also have three Denmark saddle stallions for sale. One four-year-old, two three-year-olds. Sired by Rex Donnell 2042 and out of mares I showed at World's Fair. Plenty of size, style, and finish. Priced to sell. Thirty-five years a breeder.

DR. W. E. CHEATHAM
EXCELSIOR SPRINGS, MO.

Durocs. These three sales are all close together, railroad connections are good and buyers can arrange to attend all three sales.

The advertisement will not appear again and this is the only opportunity we will have to call your attention to this sale, so we would suggest that you write at once for the catalog. R. P. Royce will represent this paper. Kindly tell them where you saw their ad.

Last Call for Taylor's Col. Wonder Sale.

For the last time we call your attention to the Duroc bred sow sale to be held by Chas. L. Taylor, at Olean, Mo., on Tuesday, February 23.

In former issues we have referred to this sale as one of the best sales to be held anywhere, and we again repeat that breeders and farmers in search of high class Durocs can not afford to overlook this offering. This is Mr. Taylor's first sale and he has selected nothing but top sows and gilts. It is strictly a Col. Wonder offering inasmuch as every one cataloged is either sired by Col. Wonder or is bred to him or to one of his sons.

No boar owned in Missouri has made a greater record than Col. Wonder. He was first prize junior yearling at Sedalia, and the American Royal in 1912; was first prize aged boar, and grand champion at Sedalia in 1913. His sire, grand sire and great grand sire were grand champions. His dam was the first prize junior yearling at Sedalia in 1911, and first prize aged sow at the same place in 1912. Her sire B. & C's Col. was a grand champion and her dam was a prize winner. Col. Wonder sired the grand champion sow at Sedalia last year, and unless some one brings out something mighty good it looks as though he would be the sire of another grand champion for this year. The offering will contain as much grand champion blood as will be found in any sale.

Mr. Taylor has put in a large number of real attractions to which we have referred in former issues. If you want blood that has proven its value, attend this sale.

Sheley and Clatterbuck will sell the following day and C. C. Boyd will sell the next. Attend all three sales. You are sure to find just what you want. Write for the catalog and mention this paper. R. P. Royce will represent this paper.

Boyd's Dispersion Sale of Durocs

Elsewhere in this paper will be found the advertisement of C. C. Boyd, Centralia, Mo., in which he announces that on Thursday, February 25, he will disperse his entire herd of Durocs.

The Duroc interests of this state will regret to learn that Mr. Boyd has decided to quit the business, but owing to other business Mr. Boyd finds that he can not devote as much time to his herd as it deserves, hence his decision to retire from the Duroc ranks.

Several years ago when Mr. Boyd began buying the foundation for his herd he secured choice stock from the leading breeders of the Corn Belt, and everything he offers carries as good blood as will be found. The brood sows and gilts will not be up in as high flesh as one would like to see but they are bred right. The real attraction of the sale will be the four herd boars, Select Col. 2nd, C. C's Col., Boyd's Cherry Chief, and C. C's Top Col.

Select Col. 2nd is absolutely one of the very best boars the writer knows of and any breeder can afford to journey a long way to buy him. He is by Select Col., and out of Belle Crimson by Crimson Wonder Again. Select Col. 2nd was shown at the Missouri State Fair in 1913 and stood second to Chas. L. Taylor's great boar, that was made grand champion, Col. Wonder. Select Col. 2nd, has everything a great boar should have; he is bred right; has extra size, and bone; a remarkably good head and ear; wide, high arched back; deep smooth sides; heavy hams; is excellent on his feet, and one of the nicest cherry reds one could ask. Buy him and you will make no mistake. He has proven himself a high class breeder.

C. C's Col, by Chief of Cols. was the first prize senior yearling at the Missouri State Fair in 1913, and this young boar will make some one a good herd boar.

In addition to the above Mr. Boyd will sell a registered Percheron stallion, and two good jacks, also about twenty head of grade calves—steers and heifers—and a number of high grade Holstein cows.

Send at once for the catalog. This sale will follow Chas. L. Taylor's and Sheley and Clatterbuck's. Buyers can therefore attend all three sales at practically the cost of one. Kindly mention where you saw the ad.

Caldwell's Annual Bred Sow Sale

Kindly notice the advertisement of C. D. Caldwell, who will sell about forty head of good big useful Duroc bred sows and gilts at Milan, Mo., on Saturday, February 27.

Mr. Caldwell is one of the leading breeders of his section of the state and for several years he has been assembling a nice herd of Durocs. His offering this year is quite the best he has put through a sale. The offering will include a number of tried sows, fall yearling and spring gilts. For the most part they are sired by Big Buddy Climax, by Climax Paul, and Leavell's Wonder by Handsome Wonder. The dams of the offering carry the blood of each sires as King of Cols., Whitehall Col. Top Inventor, and other well known boars.

Mr. Caldwell is not attempting to specialize on any one family but rather has selected his breeding stock with the sole view of producing the large, easy feeding kind that the farmer wants.

This sale will afford an excellent opportunity to buy bred sows and gilts that you can take home with every assurance that they will make good for you.

The sale will be held in town in a comfortable building and visitors will be entertained at the Stanley Hotel. Col. T. E. Deem will have charge of the sale and any bids you may care to send will be taken care of by him. Write at once for the catalog and mention this paper.

Percherons and Saddle Horses

On another page will be found the advertisement of Dr. W. E. Cheatham, Excelsior Springs, Mo., in which he offers for sale or trade a registered five-year-old Percheron stallion. The Doctor advises us that this horse weighed 2020 pounds as a three-year-old. He is also pricing three young saddle stallions, sired by the good horse Rex Donnell 2042 and out of mares that were shown at the St. Louis World's Fair.

If interested, Dr. Cheatham will be glad to quote you prices. Mention this paper.

Thompson's Spotted Polands

Jas. A. Thompson, Holt, Mo., is offering a nice lot of summer boars and gilts of the popular old fashioned Spotted kind. The sire of this young stuff is Spotted Boy by Spotted Giant, J. D. Gates' great boar that many count as the greatest Spotted boar in this state. The dams of the lot offered for sale are for the most part by the great boar Spotted Jumbo, the boar at the head of Jas. M. Andrews' herd. Here is a chance to buy as good blood as is obtainable, and at a price that is extremely reasonable. Write Mr. Thompson for particulars and mention this paper .

Lockridge's Sale Report.

On Tuesday, February 3, Will G. Lockridge held his first public sale of bred sows and gilts, at Fayette, Mo. This was one of the most successful sales held this year and resulted in the very satisfactory average of $50.65 on thirty-three head from his herd. The twelve head consigned by J. M. Pemberton averaged $37.75.

The weather was not at all favorable and consequently a great many buyers from a distance were kept away, but the way the local support got up behind the sale was a source of great satisfaction to Mr. Lockridge.

The top of the sale was $100, at which price A. O. Lowe, Fallon, Nevada, secured the very toppy fall yearling by Long King's Model out of a Success sow.

Mr. Lockridge is to be congratulated upon the way he handled the sale, and on the nice condition of his offering.

Col. R. L. Harriman conducted the sale in his very finished manner. He was assisted by Cols. A. W. Hammond and Geo. C. Crigler.

The Pemberton consignment lacked a little in size, but was a very uniform lot.

Porterfield's Sale Report

The annual Duroc bred sow sale held by J. A. Porterfield, at Jamesport, Mo., Monday, February 8th, did not result as satisfactorily as had been predicted.

The lot sold was by far the best Mr. Porterfield has offered the public and deserved decidedly better prices than the average shows. Few sales to be held in this state this year will have a nicer lot of bred sows and gilts than those offered in this sale and an average of only $33.75 does not represent their value. Mr. Porterfield was game, though, and never complained about the way they were selling. The top price was $72.50 paid by Robt. Cooper, Spickard, Mo., for a Top Inventor sow; by the way, this boar, Top Inventor, is proving to be a very prepotent sire and is transmitting his good qualities in a way that enables one to tell a gilt sired by him the minute she enters the ring.

Col. Deem officiated on the block and although he and his assistants, Cols. Nelson, Deem, Buckingham and Hamilton did all in their power to make the crowd see its mistake, they were unable to get them to appreciate the kind of stuff Mr. Porterfield was offering. A complete report of the sale follows:

SHELEY & CLATTERBUCK'S

Great Duroc Gilt Sale

Wednesday, February 24th,

New Bloomfield, Missouri.

Fifty Fall Yearlings and Spring Gilts sired by and bred to

Champions, Beauty's Model Top and Instructor, S. &. C's Valley Chief, and Col Prim.

On the above date we will sell fifty fall yearlings and spring gilts. The tops of our herd. They are by our great show and breeding boars. Included in the offering are a number of State Fair prize winners. We are selling the sensational September yearling, **Carnation,** by **S. & C's Valley Chief,** and out of a **Beauty's Model Top** dam. This gilt is a litter mate to our great young boar, **Sensation Chief.**

The entire offering is high class in every respect and we will be glad to send our catalog to all who request it. **This advertisement will not appear again.** Write at once, mentioning this paper.

P. M. Gross, Auctioneer.

R. P. Royce will represent The Missouri Farmer.

Sheley & Clatterbuck

NEW BLOOMFIELD, MO.

Chas. L. Taylor sells the 23d at Olean, Mo., and C. C. Boyd sells the 25th at Centralia, Mo.

Dispersion Sale of

Boyd's Durocs

TO BE HELD

Thursday, February 25th, Centralia, Mo.

I have decided to disperse my herd of Durocs and on the above date I will offer:

40 Sows and Gilts: 4 Herd Boars

Included in the lot is my great boar **SELECT COL. 2d**—pronounced by all to be one of the very best boars in the state. **C. C.'s COL.** is another prize winner. **Boyd's Cherry Chief** is listed.

The entire offering carries the best blood of the breed. Everything immune.

No sale will offer a greater attraction than SELECT COL. 2nd.

Write for catalog.

P. M. Gross and W. O. Smith, Auctioneers.

R. P. Royce, Fieldman.

C. C. BOYD - - - - Centralia, Mo.

C. L. Taylor sells Feb. 23, at Olean, and Sheley & Clatterbuck, sell Feb. 24 at New Bloomfield.

LAST CALL FOR

TAYLOR'S DUROC SALE

Breeders and farmers will find it to their interest to bear in mind that on **TUESDAY, FEBRUARY 23, at Olean, Mo.,** I will offer fifty head of very high class Duroc bred sows and gilts. This is strictly a **Col. Wonder** offering, as everything is either sired by him, or bred to him or one of his sons. Write for catalog.

CHAS. L. TAYLOR, Olean, Mo.

Sheley & Clatterbuck sell at New Bloomfield, Mo., the day following, and C. C. Boyd sells at Centralia the next day.

THE CHINCH BUG AND THE FARMER

Last year there was a business proposition up between the chinch bug and the farmers of Missouri. It resembled a peculiar form of tenantry and from the farmer's point of view proved most disastrous. The farmer furnished the ground,, the seed, the implements and all of the labor. The tenant assisted only with the work of gathering the crops before or after maturing. In some cases the tenant received half the crop in other cases the entire crop. The amount they received depended upon the number of tenants, the activity of the farmer and the activity of his neighbors. Often the tenants were so abundant on one farm that after all of the crops there had been gathered in they moved on to help with the gathering of crops on adjoining farms.

The tenant's (chinch bug) share of last year's wheat and corn crops alone was, at least, five million dollars. That is a terrible amount and especially with so short a crop and when there is such a human demand for food in this and foreign countries and yet the total would have been many times as great had not the farmers detected a flaw in the contract early in the season before the wheat crop was ripe. The tenants disclosed their greedy disposition early in the season and in many sections, at least, the farmers, with the aid and advice of practical and scientific experts, who had had previous dealings with the same tenants, succeeded in so reducing the ranks of the tenants that they were unable to incorporate so much of the later crops. In some cases they were completely annihiliated, though unfortunately too often nothing was done.

Such a system of tenantry between man and man would be intolerable, then why should it be tolerated when between man and the chinch bug or any other destructive insect pest for that matter? There is no real reason why such conditions should exist. It is entirely within the power of the farmers of any community or of the state as a whole to prevent such losses. And yet as this is being written the business relation between the Missouri farmer and the chinch bug is exactly the same as it was a year ago with the possible exception that there are at this time more bugs in hiding than a year ago. The question then is, do you, Missouri farmers, propose to produce this year's crops and let the chinch bugs come in for their unearned share? What have you already done to get rid of the harboring bugs on your farm? What have you done to assist or induce your neighbors to get rid of theirs, and lastly, what do you and your neighbors propose to do between now and the first warm days of spring, when the buds begin to swell and the air is teeming with the millions of nature's creatures searching for feeding and breeding places?

There are yet a few weeks during which telling work can be done to prevent the chinch bug injuries. The most practical and effective means of reaching the pest in its harboring places is to select favorable times and burn over such places. Most of the bugs will be found harboring in dry, protected places deep down in grass clumps, in meadows, pastures and waste lands, though many are harboring under leaves, along hedges, fence rows and in dozens of other places. Not anything like all of the bugs can be reached but a large portion can be destroyed and each bug destroyed means hundreds of hungry bug stomachs less next summer. Where burning is not feasible, perhaps plowing would be possible. Anything which will destroy the harboring and helpless bugs outright or expose them to rain, snow and frost will put the detested tenants so completely out of commission that they will be able to do little damage.

Is the proposition worth considering? It only means a few days' work at most and if it saves only ten bushels of wheat, worth fifteen dollars, the time would be well spent. But if the work is done carefully and seriously it will mean a gain of thousands and even millions of dollars to the farmers of the state.

The above map shows the wide spread distribution of chinch bugs during 1914 as reported to The Missouri Experiment Station

Talk it over with the boys and with your neighbors from a business point of view alone and if it seems to be worth while, lose no time putting it into operation for favorable days for the work will now be few. Keep in mind that once the pest leaves its winter quarters the work is off, so far as remedies are concerned, until the bugs again lay themselves liable during the summer migration at wheat cutting time.

If the writer can offer any further suggestions of value at this critical phase of the game or can assist in any other way, feel free to call on him.

L. Haseman,
Department of Entomology.

Unusual Interest in Poultry.

The great lot of letters we have been receiving about poultry matters shows that there is greater interest in this profitable industry this year than ever before—and it shows also that the average farmer proposes to make everything count in 1915. The first essential is a good incubator and if you have not yet provided yourself with a reliable one we suggest that you drop a postal card at once to the manufacturers whose advertisements appear in our Poultry Department and ask them to send you their literature. There is no reason why the hens shouldn't pay for a new bed room suit, kitchen cabinet, power washing machine—or why they shouldn't provide all the necessary living expenses.

Send us a check or a dollar bill and let us renew your subscription for three years before you get busy with your spring work. Do it today.

POTASH

is food for thought as well as for crops this year.

When shipments were interrupted by the war, it was estimated that there was enough Potash on hand in the United States to provide two and three per cent. Potash in mixed fertilizers for this spring's trade. Some manufacturers had more than enough for these percentages.

Since then minor sources of Potash have been fully utilized, and additional shipments from the usual source are still being received.

The supply is below normal, but this need not prevent farmers securing some Potash, nor should it lead farmers to decide not to use fertilizers.

There is no reason to return to the out-of-date goods without Potash, although some authorities may try to "wish" them on us.

We have not used enough Potash in the past. The largest annual import of Potash was only one-seventieth of the Potash *taken from the soil* by our *1914 corn crop* and only one-fifteenth of the Potash lost every year in drainage water.

Spring crops use from two to ten times as much Potash as Phosphoric Acid. Get as much Potash in the fertilizer as possible. A few firms are offering to furnish from four to ten per cent.

There is no substitute for Potash. It may be harder to get just now, but

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Hap-Hazard Methods

When one travels about over Missouri and looks out of a train window upon the farms on either side of the right of way, he is impressed with the fact that what we need in this great state at this time is not a lot of new Agricultural information so much as that we need to intelligently apply the information we already have—and this is one of the discouraging things which stares a farm paper in the face hat is really serious in its fight for better farming methods.

Upon every hand one sees self-binders, plows, cultivators, corn planters and other farming implements standing out in the fields where they were last used—the victims of the elements which vie with a mixture of rain, snow and sunshine to destroy their usefulness. What is the use of discussing the problem of why the average farmer doesn't make more money with men who thus deliberately destroy the implements with which they must carry on their work?

So, too, you see hundreds of barnyards where the manure piles are left to deteriorate until their fertilizing value is almost entirely destroyed—as well as being permitted to become an unsanitary nuisance. And this despite the fact that there never was a time when better soil fertility was more of a vital issue than it is at the present time. There are long periods during the year when farmers have plenty of time to attend to this kind of work—and yet, while some of their more progressive neighbors haul in manure from the nearest town, these shiftless ones do not even utilize that which accumulates upon their own premises.

Again, hundreds of fields which, because of their inclination to wash should never feel the touch of a plow are planted in corn or some other crop, season after season, until the dashing rains have sent whatever fertility the soil possessed on its way to the Gulf of Mexico. There are very few farmers who are not aware of this fact—and yet they continue year after year to practice these destructive methods.

In a few weeks from now, when the spring work begins, one will be able to see nightly bon-fires in every direction—farmers raking their corn stalks together and burning them up in order that they may not impede the work of the different farm tools, etc.—and yet, when they do this, they are not only wasting the fertility value of the stalks but deliberately destroying about 40% of the feeding value of their corn crop. If the corn stalks had been made into silage last fall, both their fertilizing and feeding value could have been utilized to the fullest.

Again, while some farmers, by proper pruning and spraying methods are compelling their orchards not only to generously supply their own needs but to yield a substantial profit besides, there are hundreds of others who have abandoned their fruit trees to the relentless onslaught of insects which ply their work of destruction without molestation—and thus the average orchard is a nuisance and an eye sore rather than a source of profit.

These are only a few of the unpardonable neglects of which many farmers are guilty—not through a lack of knowledge but simply because they seem unable to pull themselves out of the old rut of hap-hazard methods. As we have emphasized time and again, present land values and the present cost of farm production mean that the careless farmer is on the road to certain failure and bankruptcy. Years ago, when the soil was permeated with its virgin fertility and when land was cheap, economic methods were not as vitally important as they are today. True, shiftlessness and waste are unpardonable under any circumstances—but this is more true now than ever before. With nearly one hundred million souls who are struggling for a livelihood within our borders it means that we must make every acre give the best possible account of itself from this time forward. Let's acquire all the new and helpful ideas we can get hold of—but in the meantime, let's make good use of the common sense information which we already possess and which is almost as old as the farm game itself. If you have been guilty of any of these things in the past, why not turn a new leaf in 1915?

SMALL FARMERS MUST ORGANIZE

In discussing some of the handicaps of small farmers in comparison with the very large farms, T. N. Carver of the United States Department of Agriculture points out that immigration of cheap labor gives the large farmer a big advantage over the man who does his own work, but as it is now the small farmer has the advantage, and the bonanza farmer will continue to give way to the one-family farm.

"Another thing which threatens the prosperity and even the existence of the small farmer is the handicap under which he finds himself in buying and selling. The big farmer who can buy and sell in large quantities, and also employ expert talent in buying and selling, and in securing credit, has an advantage over the small farmer who must buy and sell in small quantities and give his time and attention mainly to the growing of crops rather than to selling them. Much of the supposed economy of large-scale poduction, even in merchandising and manufacturing, is found, upon examination, to consist wholly in an advantage in bargaining; that is, in buying and selling. When it comes to the work of growing farm crops, as distinct from selling them and buying raw materials, the one-family farm is the most efficient unit that has yet been found. But the big farmer can beat the individual small farmer in buying and selling. It would seem desirable, from the standpoint of national efficiency, to preserve the small farm as the productive unit, but to organize a number of small farms into larger units for buying and selling. Thus we should have the most efficient units both in poducing and in buying and selling.

"If this is not done, the only farmers who can enter successfully into the production of agricultural specialties, where the problem of marketing is greater than the problem of producing, will be the big, capitalistic farmers. The small farmer may hold his own in the growing of staple crops, in which field the problem of efficient production is perhaps greater than that of successful marketing. The reason for this is that there is a well-organized market for staple crops and the problem of marketing is therefore somewhat less difficult than in the case of agricultural specialties. But even in the growing of staple crops the small farmer will have a hard time of it if he is forced to compete with the big farm when it is cultivated by gangs of cheap laborers. The two worst enemies of the small farmer are the opponents of co-operative buying and selling on the one hand and the advocates of enlarged immigration to the rural districts on the other. The latter would help the big farmer in the buying of labor for his farm, and reduce the price of the small farmer's own labor when he undertook to sell it in the form of produce."

Hayes Four Wheels—Bigger Yields

GOOD seed and good soil is only the *starting point* in raising a big corn crop. You can no more afford to plant with an old, worn out corn planter or a complicated new one full of fads and fandangles than you can to plant *poor seed.*

You can't afford to waste your time and labor or *risk your entire crop* with a planter that covers unevenly, misses hills or does not check accurately.

Uneven depth of planting means a bigger loss than many realize. It's *especially bad* in cold, backward seasons; often amounts to several times the cost of a planter in a single year. Avoid planting part of the corn so deep that no matter how good the seed or how rich the soil *many of the hills never come up*—or leaving other hills uncovered so that the sun and wind *destroy or stunt their growth.*

Hayes Four-Wheels regulate depth of planting to the *fraction of an inch.* Corn all comes up at the same time, allows earlier cultivation, an earlier harvest, a *better quality* and *bigger quantity.*

28 Years the Leader

Hayes Four-Wheels guarantee *surer germination and quicker growth.* Wheels pack the dirt from the sides to hold moisture and leave a ridge on top so that the corn sprouts quickly and comes up several days sooner. The ridge gives greater surface for the sun's heat and prevents washouts in hilly fields. This method *assists the budding sprout,* protects its vitality and makes stronger and healthier stalks.

Hayes Four-Wheels *cover where all ordinary open wheels fail*—even in wet and sticky ground. Guaranteed not to clog. Short coupled, light draft and turns in shortest space. *Checks with absolute accuracy,* regardless of team's speed. Cross rows straighter than the way you drive.

The **Hayes** Drop *never misses a hill.* Simple, reliable and most efficient. Fewer parts, less breakage and delays. Has no clutch to miss and give trouble. *Never cracks or grinds the seed.* Will drop accurately any size or shape kernel. *No bare spots* in **Hayes** planted fields. No replanting necessary. Increased yields soon pay for it.

Thousands in use for years with practically no repair expense and every one giving *time-saving, money-making* service. No complicated parts to get out of fix. Strong construction, *practically exempt from breakage.* No expensive and aggravating delays in the busy planting season. Easy and simple to operate and can be trusted to unskilled help.

Think these things over and start investigating NOW. Learn the overwhelming advantages in **Hayes** Four-Wheel construction. *Ask any* **Hayes** *user.*

Learn the experience of farmers who *have* increased their yields by big margins with the use of the **Hayes**—who *have* finished planting earlier—who *have* begun cultivation earlier. Every **Hayes** user will tell you the work is easier—faster—better; the results more satisfactory—more profitable. So much depends on the work of the planter that a farmer cannot afford to get anything less than the *best service.*

Can be furnished with perfect working Fertilizer or Cow Pea Attachments, Stub Runners or Disks.

WRITE! This planter is *guaranteed.* It *must* be all we claim and all you expect. Send for Free Book "AP" of Valuable Planting Facts. Write today, then you won't forget.

HAYES PUMP & PLANTER COMPANY, GALVA, ILL.

If a horse could talk—or a sheep

"Thank you boss, I feel fine after that hair cut"

"I've just had more wool off me than ever before"

Clip Before the Spring Work Begins

Horses and Mules will be healthier and render better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better, get more good from their feed and are better in every way. If you want to sell them they will bring a higher price. The best and most generally used clipper is

The Stewart Ball Bearing Clipping Machine

It turns easier, clips faster and closer and stays sharp longer than any other. Gears are all cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade. **Get one from your dealer** or send $2.00 and we will ship C.O.D. for balance. Money and shipping charges back if not satisfied.

PRICE $7.50

and a longer, better grade that will bring the highest price. You can easily net from **15 to 20 percent more on every sheep** you shear with a

Stewart No. 9 Shearing Machine

It is the most perfect hand operated shearing machine every devised. Has ball bearings in every part where friction or wear occurs. Has a ball bearing shearing head of the latest improved Stewart pattern. Complete, including four combs and four cutters of the celebrated Stewart quality **$11.50.** Get one from your dealer, or send $2 and we will ship C. O. D. for balance. Satisfaction Guaranteed or Money Refunded.

Price $11.50

Easier to Put Up Fits the Ground

THE "swinging joint" lets line wires swing freely with the ground. Fits hilly ground as smoothly as level stretches. This gives you a better looking fence—a longer lasting fence—and a more easily erected fence. Stays are doubly strong at every joint—strains and shocks are evenly distributed—fence keeps its shape. Write for the "APEX WAY"—learn how you can save work and money fencing your farm with Apex Fence and

APEX Steel Drive Posts

Made of elastic carbon angle steel. Here is the ideal fence post for the up-to-date farm. It is strong—light in weight. Costs less than wood posts set in place—lasts for generations. No post holes needed—you save cost of digging and tamping posts—save big share of hauling and handling. Steel posts ground the lightning and protect stock—you can burn fence rows clean.

Apex Posts can be driven through any soil, gravel or soft shale without injury. Replace decayed posts in old fences with Apex Posts and save the ugly job of digging holes next to standing fence.

Write for the "APEX WAY"

JANESVILLE BARB WIRE CO.

INSECT PESTS DESTROYED BY SHEEP

That many insect pests are protected during the winter by useless vegetation along country roadsides, and that the insects may be destroyed and the undergrowth may be turned into valuable mutton and wool, are facts not generally realized by farmers. The department's specialist in charge of cereal and forage-insect investigations recommends the pasturing of a flock of sheep in these places during the winter months as a most valuable measure for destroying great numbers of insects that might later in the spring spread to and breed in adjoining fields of grain. Where weeds are outside of a fence, or where no crop is growing in the field, pasturing sheep in summer will, of course, keep down the fall crop of insect-harboring vegetation.

The amount of land covered by useless matted vegetation growing along ditch banks, fences, and roads is of no small extent in America. This land, as a rule, can not be burned over because of the danger to fences. Besides, much of the common blue grass thriving in such localities is always too green to be burned and serves to protect the thick mulch of dead grass that accumulates beneath from year to year and forms an ideal refuge for all manner of pests. A small flock of sheep, given the range of fields and roads at this season of the year and where there are no growing crops, will dispose of nearly all useless vegetation. Only a little grain need be added to fatten them. If the farmer does not wish to keep the sheep permanently, he may often purchase "feeders" in carload lots at the large stockyards when they are just in condition to be fattened and later dispose of them.

Over the prairie country sheep will eat off grass and shoots of larger brush and plants, leaving the ground so bare of protection that insects either will not congregate there or gain protection there after the pasturing is done. In the East, where trees, brushes, and brambles enter into consideration, if this brush is cleared off in spring the sheep will in late fall dispose of the young growth that may push up through the summer. By herding the sheep along the roadsides and properly shifting them about according to condition in the fields, all of this waste ground can be made to yield a return to the owner, and incidentally add to the value of the farm.

On account of their light weight, sheep can be pastured in fields when the ground would be too wet for heavier animals. Their small feet, entomologists find, are also more effectual in destroying insects on the surface of the ground than the hoofs of larger animals.

Method Should Lessen Depredations of Many Pests.

The list of dangerous pests that winter along neglected roadside margins is long and formidable. The chinch bug, the spring grain aphis, or "green bug," and the clover and alfalfa seed chalcis fly have all been found by investigators wintering in great numbers in such undergrowth. Under certain favorable conditions in the fall the Hessian fly also breeds freely in quack grass, and in Canada one specialist has traced the western grass-stem sawfly directly from this grass to the wheat fields. This sawfly does considerable damage to wheat in the Dakotas. Young stalk borers (Papapiema nitela) were noticed in very young oats as early as 1884 by the department's specialist under conditions indicating that the parent moths had spent the winter in the matted grass along the border of the fields.

The department's investigator has successfully put the winter sheep-grazing plan into practice with some 3 miles of roadside and even more of fence margins. Many successful farmers have also tried it with profit, but they have not always realized that in addition to the destruction of the useless vegetation they were destroying insect pests that would have become positively dangerous later on. —Weekly News Letter.

The Missouri Farmer

VOLUME VII MARCH 1, 1915 NUMBER 5

Farmers Need Organization, Now

By Geo. B. Ellis, Managing Editor

The man who has been feeding hogs or cattle corn that cost him 70 or 80 cents a bushel and has been forced to sell his finished product at recent market prices surely has a grievance. The greater his effort to help feed the world and to make a living for himself the greater his loss has been. And equally with the cattle and hog feeder is the man who was selling wheat at 65 or 70 cents a bushel last July and August when he knew it would take a dollar a bushel to give him a reasonable profit. When the great markets force the price of dressed meats higher and the price of fat hogs and cattle lower on the same day, the farmer has good grounds to assert that there is some influence other than supply and demand in control of the markets. When the farmer goes to the merchant to buy a farm implement he is told the price set is as low as is consistent with the first cost and a reasonable profit addded and the buyer pays the price knowing that if the profit was fixed on a reasonable basis he has the worth of his money. But when the same farmer drives his hogs and cattle to market the rule is changed and he is told that profits are not considered but it is just what the other fellow is willing to pay. When the farmer has a little surplus money on hand he takes it to his friend, the banker, and is told two per cent is all the money is worth and all the bank can possibly pay and they take only as an accommodation. When he gets in a tight place and wants to borrow some money his friend the banker says money is scarce and worth eight per cent, and they are not anxious to loan any more but just to accommodate a friend and old customer they will let him have it for ninety days. When you borrow money from the bank thirty days make a month, always, and if you renew your note a few times you find the year is five days short, whereas, if you happen to let them have your money it's funny, but the year comes out even to a dot.

The Farmer Pockets the Loss

When some state official, or may be it is a college professor, finds that he must live the simple life to keep within his income, or that he must cut out that Euorpean trip he feels so much in need of or he must do without a bigger and finer automobile that he needs so much to keep up with millionaire Jones, he is not a bit modest but proceeds to raise a howl about the high cost of living and inadequate salaries that can be heard across the continent. But the farmer is supposed to go right along in the even tenor of his way and sell cattle at $8.50 a hundred that cost him $10 a hundred to produce and live in hope that times may change and by another year he may be able to get back at least a part of his loss. Drouth and flood, windstorm and frost, insects and live stock diseases are sometimes inflicted on the farmer so frequently and so long that his profits of many years of frugal living are wiped out, but no lobby assembles at Jefferson City to put up a pitiful wail about the crisis of the farmer as it is now doing for the great railroads of the country. We might go on and fill these columns with similar comparisons, but what is the use? We all know these things exist so why not try to find out what is the remedy? Our remedy lies in better organization and closer co-operation among farmers.

Two years ago when the Legislature of Missouri passed laws unsatisfactory to the great insurance companies operating in the state what did they do? Did they submit without protest or action like we farmers would have done? Not a bit of it. Standing together as one man they defied the state, they dictated terms to our state officers, laws enacted by our Legislature were trampled under foot and they proceeded in their own way to do business. This they were able to do by the power of organization and co-operation.

Organized Effort Changed President

A general depression of business, the European war, short crops and higher wages were some of the excuses put forth by the railroads of the country for asking an increase in rates. The Interstate Commerce Commission after hearing their plea denied the necessity of it and refused the request of the railroads. What happened? The superb organization of the railroads, East, West, North and South, with its inter-related industries everywhere brought such powerful pressure to bear upon the president of the United States and upon the members of the Interstate Commerce Commission that they were compelled to reverse their decision of a few weeks before and to grant the request of the railroads. This the result of organized co-operative effort. I have not given these illustations to show what ought to have been done in these particular instances, but merely to show the power of organized effort. No one insurance company could have defied the State of Missouri. The largest company could have quit the state and had the others continued the insurance business would have suffered little inconvenience, but when all the companies stood together the state's laws were nullified. One or two of the largest railroads of the country acting alone could not have compelled the most powerful governmental agency in this country to reverse its decision because the transportation of our products could be carried on without much interruption if they had suspended operation. But when the combined power of all of them is used the business of the whole country is threatened and their object is accomplished.

I would not spend my time and effort to arouse farmers to get together and co-operate for their own interests if I did not believe there was a great necessity for it. Of all classes of men in this great country of ours we do not believe there is any other class so poorly paid as farmers, and I am not a pessimist either. The only reason farmers have prospered at all in the last decade is because they live a more frugal and simple life than that of city people. If farmers are to pay for good roads; if the children of the country are to be given equal high school privileges with the children of the cities; if the farm home is to have the same modern labor-saving, health saving conveniences that the city home has; if the farmer is to travel some with his family and learn what is going on in the world, then the farmer must have a better profit. Whether that profit is to come through greater efficiency or higher prices will depend on conditions from year to year but it will be the business of the farmer to demand a better profit and he can get it though organized co-operation.

Farmers' Income Too Low

To prove the profit of farmers is too low we have in addition to our own experience and observation the results of a recent careful survey of farm conditions in a representative county of Missouri, and it may be said this county is fairly representative of the grain and live stock section of the United States. The Missouri State University, through its department of farm management, has gathered complete data covering the operations of 669 farms situated in four townships in Johnson County and comprising about two-fifths the area of this large county. These 669 farms include 272 farms operated by the men who owned them; 218 who owned some land and rented some; 179 who were renting all the land cultivated. These 669 farmers were handling on the average 137.8 acres of land which was worth including his machinery and live stock, $11,531. With this investment and for one man's labor a yearly gross return of $1841 was made. Hardly enough to pay the salary of an assistant professor in the State University. Only about enough to pay the salaries of two stenographers in a business office but mind you this represents the farmer's gross income for a year's labor and interest on his capital of more than eleven thousand dollars. After deducting expenses and interest on capital, the average farmer, land owner and tenant, had the magnificent (?) sum of $442. If these figures are correct, and we think they are, then something is wrong somewhere with the farmers' income, and it is our duty to try to find out what it is.

As I write these lines I realize they will be read in fifty thousand farm homes, some of which have a much larger income than the above average, but we take it for granted the income given is fairly representative. There are certain things the individual must do for himself to increase his income, such as introducing better business methods, better farming methods and so on but these are not the things we want to call attention to in this article. In this article we want to suggest some of the things the farmers of a school district or a township can do to better their conditions both financially and socially, and to show how great that help might be if the organization extended to the whole state.

A Plan of Organization

One of the ablest authorities in this country on farm organization is T. N. Carver, a man who is, we believe, in thorough sympathy with the betterment of conditions surrounding farm life. Mr. Carver divides the needs of rural communities into: 1, Business Needs. 2, Social Needs. For organizing any community, it is recommended that each of these be divided into special lines and a committee appointed to make special study of each line. The lines suggested under Business Needs are: Better farm production; better marketing facilities; better buying facilities; better credit facilities; better means of communication. The Social Needs are: Better educational facilities; better sanitation; better opportunities for recreation; beautification of the country side; better home economics.

As soon as a local organization is formed it will be well to appoint a committee of three or more to make a special study of each of these lines of work and suggest a plan of procedure. There should be separate committees for each subject under consideration but it will not be necessary to undertake work along all these divisions at any one time.

Take the first of the committees, that on better production. It should be the first duty of the members of this committee to make a study of all the leading crops produced in the community. It will be an easy matter for this committee to secure the best literature from the state and the national departments and from other state departments and to appoint special meetings for the study of the subject. We are not going into detail here but it will be apparent to any reader that where a whole neighborhood takes up the study of a subject in concert that about all that is worth knowing will soon be commonplace knowledge in that community.

In our next article we will take up the discussion of the committees' work in Better Marketing Facilities and Better Buying Facilities, and will aim during the next few months to completely cover the whole plan of organization outlined above.

WHAT SHALL WE TEACH OUR BOYS AND GIRLS?

One cannot legislate into people the desire for knowledge. When the desire for knowledge exists the people will get it, legislation or no legislation. This has been abundantly proved in Johnson County.

The boys and girls of this county want to know about things of the farm and home and they are pestering their

C. M. Long, County Farm Agent, Johnson County

fathers and mothers half to death to find out about them. How did such a condition come about? It was brought about by team work on the part of the County Superintendent and the teachers and the farm agent.

The County Superintendent was raised on the farm, has been a school teacher and has a head on him, although devoid of hair, that is full of good common sense. He calls me his Assistant School Superintendent, and I call him my Assistant Farm Agent. That makes both of our offices bigger as we each have an assistant.

Interesting the People

Last July and August, we conducted a School Board and Patrons' Day in twelve townships. We loaded up the Ford with a tent that would hold about 350 people and we went right out into the center of these townships and set up the tent where a local committee had arranged seats and water and the women of the neighborhood had provided basket dinner. The districts were generally well represented, sometimes the crowd running up into hundreds and one time exceeding a thousand persons. We talked over the problems with the school patrons and told them that we were going to take them at their word on the teaching of agriculture and home economics. You know if you mention to many farmers, the teaching of these subjects in the schools they will say, "Oh, I guess I know more about farming than the teacher does." The mother will say the same thing about the home work. Both are often right, and we proposed to put them at the job. At these meetings an outline was presented as to what we wanted them to teach the children when school began and it was proposed to have an exhibit of the work four or five weeks after school opened. The parents agreed to help in this instruction. When the fall teachers' meeting was held, the plan was explained to them and their support solicited. As soon as the schools opened, the Ford was again in action and the Superintendent and I set out together to visit the schools and explain the plan to the children. A schedule was made so that the parents could come in if they wished. This they did when the weather permitted and more basket dinners with fried chicken, etc., followed.

At this time the school exhibit was planned and we urged the children to go to their parents for instructions in how to select or prepare their part. We also urged that when the instructions had been received that they select or prepare their exhibit alone. We are glad to say that this plan was nearly always followed. After the exhibit had been held at the school house they were to be brought together for the township exhibit. The best school at the township exhibit would represent the township at the county exhibit. Only ribbons were offered at the school exhibits except on two entries. These were for the boy having the best corn and the girl having the best loaf of bread. The prize was to be a trip to the County Round-up with the expenses paid by the school. At the township exhibit prizes were to be offered and each district was urged to raise five dollars and all the special prizes possible. Aside from the right to represent the township, the winning district was to get a pennant like the illustration herewith. At the county exhibit more prizes were offered to the children and a banner to the winning school and a gold watch to the teacher.

Did the Plan Work?

Ask the parents themselves. One lady said, "I have two girls and a boy and they almost tormented me to to death. One girl wanted me to show her how to sew on buttons and the other wanted me to let her bake the biscuits and make the bread, while the boy did not let his dad rest until he showed him how to select seed corn." Another lady said, "My little girl went at her tasks one at a time and learned how to do them. When it came to baking the light bread I tried to dissuade her, thinking it would only mean a waste of flour, but she insisted until I gave her a lesson and now she can beat me." Another mother said she had to make her girl quit her tasks each night to go to bed. One father said he could not get his boy to do anything but hunt corn. I asked him if he had any trouble getting this boy to go to school. "Why, no," said he, "I could not keep him away." Now that is what we want. We must make our school so interesting that we can't keep the children away. Someone has said, "A dog will run just as fast with a can tied to his tail as he will run after a cat, but he will not get half as much fun out of it." Likewise, we can make children go to school but they will learn twice as fast if they like to go. If you chuck Johnnie down and say, "now I am going to teach you to select seed corn," he will know no more at night than he did at the beginning.

Locust Grove School Exhibit, Chilhowee Township. Farm and Home Products. Miss Flora Crutchfield, Teacher.

If he comes to you and says, "Dad, show me how to pick out seed corn," or if the little girl comes and says, "Mother, show me how to make button holes," that is your opportunity. You can teach them more in fifteen minutes, when they are in this attitude than you can by the other method in a whole day. All over our county you can hear stories of how the children have taken greater interest in both the things of the home and the farm.

Superintendent Boston says that more agriculture and home economics have been taught in the county this fall than have been taught all put together before.

Other Results of this Kind of Education

The parents have been induced to come to the school and find out its methods and co-operate with the teacher. The people in the districts are thinking about their school and comparing it with the others.

It has aroused keener interest on the part of the children for this kind of teaching. The mother shows the girl how to work button-holes and make bread. The girl's products failed to get the blue ribbon at the contest. The mother begins to wonder if there is anything wrong with her methods of doing these things. Sometimes the child herself asks that question. The same applies with regard to corn and seeds on the part of the father and son.

The summer meetings, the meetings with the parents at the school, the coming together of the patrons at the school exhibit and the township exhibits promotes sociability and co-operation. Especially does the township exhibit do this. In order to hold the township exhibit a local committee must be appointed to manage the affairs and raise the premium list.

Aside from the five dollars from each district mentioned above, pigs, chickens, eggs, pure bred seeds and any other farm products were offered for premiums. The merchants were not asked to contribute much. This teaches us to pay for our own pleasure and entertainment. These prizes also enforce the lesson taught by the exhibit much more than gew-gaws and trinkets from stores. To add life to the occasion, team hitching contests and corn stringing contests were held. These tend to create a pride and efficiency in farm work.

The whole plan not only instructs the child in the things by which 90 per cent of them will make their living but it teaches them that the calling they are about to enter has something to it and they will have greater respect for it.

Summary of the Work in Johnson

Summer school-board and patrons meetings held, 10; attendance upon these meetings about 4500. Schools visited by Superintendent and County Agent, 55; patrons and pupils present at these schools, 1500; school exhibits at the school houses about 90; township exhibits held, 10; number of things exhibited, 7750; pigs as premiums in township exhibits, 20; total value of other premiums between six and seven hundred dollars; total number of ribbons awarded to children in the county, 5000; one county exhibit held; townships represented, 10; value of prizes offered $100.

In closing we will say that we feel that by this kind of work we can get more agriculture and home economics taught than by putting on our statute books the best laws in the United States regulating our teaching.

C. M. Long,
County Agent, Johnson County.

HOG CHOLERA ERADICATION
(Continued)

J. W. Connaway, Veterinarian Missouri Experiment Station

In the previous articles I showed the failure of efforts to get rid of hog cholera by the methods that have been followed by many veterinarians—in private practice and in official work. Official veterinarians have been misled by the fact that the "simultaneous method" is better for **immunizing** purposes than "serum alone," a fact that everyone admits. But efforts to permanently immunize all the hogs in a neighborhood, (much less in a county or a state), is an expensive procedure in dollars and cents to the farmers, merely for the vaccinating, and when the farmers discover that the simultaneous immunizing process perpetuates the disease and requires the vaccination of every crop of pigs—and in some cases the revaccination of the breeding herd, they want something better; they want eradication and freedom from the disease, so that they may be able to raise hogs, and avoid cholera, and avoid the vaccination tax. This is what the plans which were worked out by the Veterinary and Farm Management Departments of the University will give them. The plans have been tested and have been found satisfactory to the great majority of the farmers where the plans have been put into operation. I refer with confidence to the farmers of Johnson, Dade, Cape Girardeau, Cass and Bates counties who have joined the "anti-hog-cholea movement" in an organized way.

The Kansas City Serum Producers' Club, which has recently been so active politically, in the matter of fighting an alleged bill in the Legislature to prohibit the use of "Virus," has not only credited me with being the instigator of the mythical bill, but that I am also alone in the stand I take against the use of the simultaneous method as a measure for controlling hog cholera.

I am glad to say that I have good company among the veterinarians engaged in official work. Some think as I do. And it is gratifying to know that the anti-virus group is growing larger every year. For the logic of results is teaching the men in official work that "immunization," and the saving of large numbers of hogs, by the simultaneous method, is not controlling and eradicating the disease.

At a recent meeting of the U. S. Live Stock Sanitary Association held at Chicago I had an opportunity to talk with men in official work from various states, and I know that the inclination is now strong to abandon or greatly restrict the use of the simultaneous method, and to emphasize the sanitary and educational phases of the work, namely to organize the farmers into "anti-hog-cholera clubs" and teach them how to apply sanitary measues, and to use as little serum as possible and no virus.

It will be of interest to the Missouri farmers to know what the officials of other states are doing and thinking about these matters:

The State Veterinarian of Pennsylvania opposes the use of virus in that state. Both the State Veterinarian and the Veterinarian of the Agricultural College of Michigan do not favor its use for "eradicating hog cholera." The Commissioner of Agriculture of Virginia supplies serum to the farmers but places a ban on the use of virus. The State Veterinarian of North Dakota, who is also the Agricultural College Veterinarian, does not favor the use of "virus." The State Veterinarian and Colleges of Agriculture of Colorado and Nevada are opposed to the use of virus, and have regulations against its intoduction into those states. The veterinary authorities of Maine use serum but not virus. The veterinary authorities of South Carolina "taboo" virus, but use serum alone.

The State Veterinarian of Georgia says: "I have always been more or less opposed to the use of "virulent blood," and am in no mood or position to change my opinion. The more I think it over the more I am convinced that the use of virulent blood is to say the least of it a risky transaction. Your teachings of greater sanitary precautions are strictly in accordance with my ideas on the subject."

Minnesota takes a "wee drap" of "virus" but is tapering off rapidly so far as the College department is concerned. This department has always insisted on a large place for sanitation in hog cholera control work. Dr. Reynolds writes me as follows: "We are studying the question of developing a state wide campaign on the subject of sanitation and sense in connection with hog cholera. For some time I have been telling people they have no right to be scattering hog cholera with both hands and two feet and clamoring for serum at the same time. This is one point where we certainly agree."

In Kansas both methods are being used in official work and a combination of the two. In regard to the simultaneous method—Dr. Schoenleber summarizes as follows the conditions unfavorable for the use of the serum-virus method: "Do not use virus on pigs under 50 pounds weight—as immunity may not last; do not use it on pregnant sows (they are liable to abort); do not use it on suckling pigs; do not use it on hogs suffering from any disease (the addition of the virus to an already sick hog may prove fatal); do not use virus if the hog has a high temperature from any cause; do not use virus on hogs infested with parasites (the lowered vitality may cause them to develop an acute and fatal attack of cholera); do not use virus if the surroundings are not sanitary." "Serum alone," he says, "should be used under these conditions until such time as the conditions are right."—That is the ideal conditions would be a perfectly healthy herd on a perfectly clean farm. My contention is that when a farmer has such conditions as these he is very foolish to run the risk of putting hog cholera on his farm for Dr. Schoenleber says in the same article: "While it is possible in many instances to use the serum and virus successfully without loss our experience has shown that at times great losses are incurred." In fact so many conditions are mentioned where virus should not be used, because of danger to the individual herd and so few valid reasons exist for the use of virus, I am convinced that the Kansas authorities will abandon the use of virus in field work as a measure for the eradication of hog cholera.

The maintenance of the resistance of the herds of any considerable territory, as a county, by continued serum-virus immunization—is too expensive and too uncertain—the simpler method of neighborhood sanitation, by the farmers themselves under the direction of a competent sanitarian, and the use of serum alone when vaccination is needed will give more permanent freedom from hog cholera.

In Nebraska both methods have been used by the State Veterinary official, and College Veterinarian. That the use of the serum-virus is not pleasing to all Nebraskans is evident from a letter I received from Mr. Meyer Brandwig, of Spencer, Boyd County, Nebraska, who sent me an article he wrote for the Nebraska Farmer more than a year ago (Dec. 17, 1913), in which he gives his sad experience from use of the simultaneous method. A few quotations from the article and from his letter are pertinent. "I had a herd of 92 hogs comprised of sows, and spring, summer and fall pigs. They had run on ten acres of alfalfa and had been fed about equal parts of a mixture of corn, oats and wheat. By treatment I believe I had eliminated the worms. As a sanitary measure I had been using disinfectant sprays in the beds and troughs and sprinkling lime about the yards. My hogs were in perfect health and had a ravenous appetite; while those of my neighborhood in three directions were dying from cholera." (This farmer was doing most of the things we advocate and which the members of our "anti-cholera club" are practicing. He continues: "I became somwhat nervous and wrote to the State Experiment Station for advice and serum. I was advised to use the 'simultaneous method,' and was assured that the losses by this method averaged only 2 to 3 percent." (It will be observed that the conditions of the herd and the hog lots in this case were the ideal conditions that would give best results according to those who advocate the serum-virus treatment.—J. W. C.) "On October 13 I had all my hogs vaccinated according to the directions. At the end of the succeeding week I lost two pigs, the remainder of the herd was well, apparently and continued to be so for about six more days, or twelve days after vaccination. Within three days from this time they began to die and others were sick. I sold twenty-one head and left the others (70 head) for experimental purposes. I have lost more than thirty head of those including old sows, and am still losing." (His recent letter gives the total loss at 43, leaving him only 27 head out of the 70 head). "This is not by any means an isolated case. A neighbor who was possibly influenced by my example vaccinated ninety-one head a few days after my hogs were vaccinated. His animals were all well at the time. He now reports that more than fifty have died. He reports similar experiences in other herds and says, "there are only three men in this community that have vaccinated well herds and had satisfactory results." He says "I am led to believe that the

Few Farmers Realize How Much More Power They Need

There are only a few days when the conditions are just right to plow. With a Tractor you can do all your plowing at just the right time. A Tractor also gives you more power for plowing deeper, for doing more disking and harrowing, for harvesting your grain quick. Other men who own Avery Tractors have proved that Tractor Power means bigger crops, less expense and less hard work.

Learn All the Facts about Tractor Farming with Avery "Light-Weight" Tractors and "Self-Lift" Plows

The five sizes of Avery Tractors, pulling from 2 to 10 plows, make Tractor Farming successful on any sized farm—large, medium or small. All 5 sizes built alike. All light-weight for their power. Built so strong there's almost no wear-out to them. Simplest tractors of any. Proven out by every test known. Strongly guaranteed.

The Big Avery Tractor and Plow Book will tell you why Tractor Farming means *Bigger Crops, Less Expense* and *Less Hard Work*. It will tell you about all kinds of Tractor designs. It gives suggestions on choosing a Tractor. And finally, it tells about Avery Design and Construction, Avery Tests, Avery Guarantees, Avery Prices and The Company behind Avery Tractors. Write now for 1915 Avery Tractor and Plow Catalog and *get all the facts*.

CLOVER AND SOIL FERTILITY

Clover is the most important legume crop used for building up land, and the ease with which the crop can be grown is taken as an indicator of the fertility of the soil. It is an almost universal practice, and is taught by all Agricultural Experiment Stations, to include clover in every rotation and thus improve or maintain the crop producing power of the soil. It is generally assumed by farmers that land that will not grow clover or that grows it sparingly, is in a bad condition or of inferior quality. Long years of experience has taught that those soils most deficient in organic matter, or humus, offer the greatest difficulties in getting a stand. Deficiency of organic matter means bad physical condition, poor water-holding capacity and probably shortage of available plant food—all conditions very unfavorable to young clover.

Less Than One Acre a Farm

According to the last census there was in Missouri 262,622 acres of clover, an average of less than one acre for the 277,244 farms in the state, or 2.2 per cent of the total area in cereals and timothy. The total acreage of clover, and clover and timothy mixed was 1,766,677, which represents approximately 7 per cent of the total improved land in the state, or about 15.4 per cent as great an area as of corn, wheat, oats and timothy together.

In considering the 1,504,055 acres reported in clover and timothy mixed, it must be remembered that one-half or less than one-half of this area is occupied by clover. If the clover were grown alone it would represent an area of 752,027 acres, which would approximately be 2.7 acres for each farm. This is a liberal allowance. Anyone familiar with mixed timothy and clover meadows, knows that the timothy is invariably the predominating crop, and that the clover usually occurs only as occasional isolated plants, Considering the total clover acreage alone, it would approximate 3.6 acres for every farm in the state.

This surprisingly wide discrepancy between the acreage of clover that ought to be grown to maintain soil fertility and the acreage actually reported may be attributed to a lack of appreciation of the value of and need for legumes, and inability to grow clover successfully with any degree of certainty.

Clover Increases Corn Yield

The Missouri Agricultural Experiment Station found that where corn has been grown on the same land for 17 years continuously without manure, the yield has been reduced to 11.8 bushels per acre. Where the land has been simply rotated to corn, wheat, clover, the yield stands at 50.7 bushels per acre. The Illinois station reports similar results. Where corn was grown continuously for 28 years the yield was 22 bushels per acre. When oats was rotated with corn the yield was 36 bushels, but in a rotation of corn, oats, clover, the yield was 59 bushels per acre. These figures show in a most striking manner the beneficial effect of clover on land.

A rotation including a legume every third to fifth year means that at least from 20 to 30 per cent of the tillable land must be occupied by a leguminous crop every year, except in those sections of the country where leguminous catch crops, such as cowpeas, soybeans, can be grown between the regular crops without the loss of a full season. Even the most casual observer knows that there are few, if any, places where clover occupies anything like 20 per cent of the tillable land, and yet clover is by all odds the most important legume crop grown in the state.

The writer has traveled over Missouri quite extensively during the past four years, and on the basis of the observations made the conclusion is reached that probably less than 25 per cent of the area seeded to clover produces a really good crop. In seasons of abundant rainfall the percentage of successful crops is higher, while in seasons of extreme drouth the percentage of failures is greatly increased.

More Clover, Less Corn Acreage

The last three years have been most unfavorable for the growing of clover. Thousands of acres were seeded each year, but the young plants were destroyed by the dry weather of the late summers. Although this has been both discouraging and costly, the Missouri farmer should not fail to sow as large an acreage of clover as his rotations and funds will permit. In the light of the results obtained by the Agricultural Experiment Station and by many farmers, an increase in the acerage of clover accompanied by a corresponding decrease in the acerage of corn, would not result in a decreased production of the latter. In addition, a large amount of hay would be produced and the fertility of the land improved.

During the dry years very little organic matter has been added to the soil and the already low supply has been depleted to a still greater degree. The lower the content of organic matter the greater the difficulty of getting a stand of clover. In reality clover is a crop for maintenance of fertility rather than for soil improvement; that is, it is much better suited to grow on fairly fertile soils to keep them so, than for the improvement of really poor soils. It can be grown on poor soils only with the greatest difficulty, and remedial measures to enrich the soil generally have to be taken before any real success is attained. In ordinary soils only about two-thirds of the nitrogen supply of a clover plant comes from the air, the other third coming from the soil, so that when the tops are removed as hay, one is removing just about the proportion of nitrogen that came from the air, leaving in the root and stubble just about the amount that was taken from the soil. In taking off a clover crop, therefore, one is not building up the soil to any extent in nitrogen but about maintaining it. In order to increase the nitrogen in the soil it is necessary to feed the crop back on the land, pasture it off, or occasionally turn under a crop.

With the present high prices of grain there is a tendency to devote every available acre to the production of corn and wheat at the cost of clover and other legumes. The decrease in the number of live stock results in a decreased production of manure. The resultant of such conditions is that the organic matter in our soils will be reduced to such an extent that grain crops no longer will be profitble, and the growing of clover will become exceedingly difficult. To build up the land will require special care, the use of commercial fertilizers and costly treatment. The thoughtful farmer will therefore not be tempted for temporary gain, to exclude clover as a prominent part in his rotation, but will increase the acreage of this important legume in proportion to the returns he expects to obtain in the years to come.

Creating a New Art

At the Centennial Exhibition at Philadelphia, the exhibit of the Bell System consisted of two telephones capable of talking from one part of the room to another.

Faint as the transmission of speech then was, it became at once the marvel of all the world, causing scientists, as well as laymen, to exclaim with wonder.

Starting with only these feeble instruments, the Bell Company, by persistent study, incessant experimentation and the expenditure of immense sums of money, has created a new art, inventing, developing and perfecting; making improvements great and small in telephones, transmitter, lines, cables, switchboards and every other piece of apparatus and plant required for the transmission of speech.

As the culmination of all this, the Bell exhibit at the Panama-Pacific Exposition marks the completion of a Trans-continental Telephone line three thousand four hundred miles long, joining the Atlantic and the Pacific and carrying the human voice instantly and distinctly between New York and San Francisco.

This telephone line is part of the Bell System of twenty-one million miles of wire connecting nine million telephone stations located everywhere throughout the United States.

Composing this System, are the American Telephone and Telegraph Company and Associated Companies, and connecting companies, giving to one hundred million people Universal Service unparalleled among the nations of the earth.

FARM FACTS

Cheap money will solve many of the farmer's problems.

There is not enough of the community spirit among our rural districts.

Success in farming depends largely upon proper marketing methods, cheap money and co-operation.

Something is wrong in our marketing system when a small crop brings more money than a bountiful one.

Co-operation between practical farmers and proficient business men will eliminate ignorance and prejudice.

The highest duty of state and Federal Governments is to place agricultural education within the reach of all.

The farmer cannot be helped until he organizes, and the Government can best help the farmer through organization.

By co-operating with his neighbor the farmer can learn new methods of culture and the interchange of ideas will benefit both.

The Nation's menu must be made up from the fields, pastures, orchards and gardens, and to farm intelligently the farmer must know what is needed.—Peter Radford, Lecturer National Farmers' Union.

Except on the flat prairies and possibly some river bottom land there is not a neighborhood in the state of Missouri but what ought to have a surplus of clover seed to sell. Remember this: Clover seed is more profitable to sell at $12 a bushel than to buy fertilizer at $30 a ton. These are hard facts—take your choice.

PROFITABLE USE OF CORN SILAGE FOR FATTENING CATTLE

The feeding of corn silage to fattening cattle is increasing to such a large degree and the popularity of this feed is so great that it is no exaggeration to say that to these facts more than to any other, can be accorded the honor of placing the beef fattening industry of the corn belt on a basis where it will not be replaced entirely by other forms of live stock husbandry as has been the case in some of the regions outside the great corn producing sections. Silos are being erected by the thousands each year. When a silo is erected, the owner usually stays in the cattle business.

Corn silage has been fed to several hundred cattle fed experimentally at the experiment stations of the corn belt with exceptionally satisfactory results. In eight trials at Purdue Experiment Station rations containing corn silage properly fed have without exception been more economical and returned greater profit on the investment than any other rations fed.

The most marked effect has been in the saving on the cost of gains. The rate of gain was not greatly decreased. The addition of corn silage once daily to a ration of shelled corn, clover hay and cottonseed meal decreased the cost of gain $1.09 per hundred pounds; feeding silage twice daily effected a saving of $1.80 on each hundred pounds of gain. This saving in cost has been secured without sacrifice of finish on the cattle. The average of all trials at Purdue show practically the same selling price for the cattle fed silage and those receiving only dry roughage. In the winter of 1911-12 a drove of cattle were fed a ration of shelled corn, cottonseed meal and corn silage for a period of 160 days. The cattle weighed 969 pounds per head when started on feed. They were of choice quality but did not carry enough flesh to make them cost within 50 cents per cwt. of the top of the feeding cattle market. Nevertheless, at the end of 160 days' feeding, they were sufficiently well finished to sell at the top of the Chicago market for fat cattle ($9.00 per cwt.) which was the highest price paid for cattle during the year until that time.

Corn silage has limitations. It is more deficient in protein than corn. In order to secure satisfactory results it is necessary to give the cattle a concentrated feed rich in protein. The feeding of corn silage without supplementing it with a feed rich in protein gives no better results than when silage is not fed. Trials at Purdue Experiment Station and Missouri Experiment Station have clearly shown that a ration of corn, clover hay and corn silage is not any more efficient than one of corn and clover hay. In fact, the rate of gain made by the cattle was less when silage was fed than when the ration consisted of corn and clover hay and were it not for the relatively low price of silage the profits would have actually been reduced by the addition of silage.

The value of adding a feed rich in protein to a ration containing corn silage is shown by trials at Purdue. The addition of cottonseed meal to a ration of corn, clover hay and corn silage showed on an average of two trials an increase of 24 pounds monthly per steer with a reduction in cost of gain of $1.56 per hundred pounds. Since the conclusion of these trials, corn silage has not been fed at Purdue except in connection with a concentrated protein feed. Cottonseed meal is fed at the rate of 2.5 pounds daily per 1000 pounds of cattle because extensive trials have shown this to be the most economical quantity in which this supplement should be fed. The trials have shown that when cottonseed meal is fed in smaller quantities than 2½ pounds per 1000 pounds of cattle, the steers do not gain or finish as well as when the larger quantity of meal is fed. Trials also have shown that larger quantities than 2½ pounds produce approximately the same results as the amount recommend but at greater cost thus reducing the profit from the feeding operation.

When a ration of corn, cottonseed meal, clover hay and corn silage is fed to fattening cattle, the quantity of clover hay consumed is so small that any beneficial results derived from its use can be better explained by saying that the good comes from meeting the demand of the cattle for some form of dry roughage in connection with silage than to the actual nutrients furnished by the hay. This has been proven by three trials in which oat straw replaced clover hay in the above mentioned ration. In every case, as good results were secured by use of oat straw as from clover hay. Moreover the ration containing oat straw was cheaper. Of all the rations tested at Purdue, the most efficient, when rate and economy of gain, finish of cattle and profit per head are considered, has consisted of corn, oat straw and corn silage in such quantities as the cattle would eat twice daily and cottonseed meal at the rate of 2½ pounds daily per 1000 pounds live weight of cattle.

F. G. King,
Indiana Experiment Station.

This lot of cattle were fed corn silage and oat straw for 70 days, then corn in addition for 110 days. Daily gain per head was 2.2 pounds. Final weight per head 1350.5 pounds. Cost of 100-pounds gain was $7.92. Purdue, Indiana, Experiment Station.

GOOD ROADS NOTES

No other citizen realizes the value of good roads as does the farmer.

A community can safely be judged by the kind of highways it maintains.

The greatest chasm between the producer and the consumer is the mud hole.

Production must cease when the transportation costs eat up the profits.

There is something radically wrong with the farmer who is opposed to good roads.

Without good roads, there can be no development that will be permanent and enduring.

Bad roads keep children away from school and impair the efficiency of church work in a community.

The elementary principles involved in improved highways are social and domestic happiness and business economics.—Homer D. Wade, Chairman Good Roads Committee, National Farmers' Union.

Studebaker
WAGONS BUGGIES HARNESS

FORTY-THREE YEARS OF SERVICE CUTS DOWN WAGON'S COST

My Studebaker was bought 43 years ago from Delbart Lowe of Webberville, Mich., by Daniel Herrick, a pioneer in this vicinity, now 80 years old.

In 1887, S. E. Dean bought the wagon from A. B. Herrick, Daniel's son.

Eight years ago L. C. Dean, son of S. E. Dean, bought the wagon from his father and still uses the wagon on his farm.

The wagon has stood out of doors for 26 years; a yard and a quarter of gravel can be drawn in it now.

Levi C. Dean,
R.F.D., Webberville, Mich.

A Studebaker that has served three generations—

FORTY-THREE years ago Daniel Herrick bought a Studebaker wagon. Mr. Herrick's son sold the wagon to S. E. Dean and Mr. Dean's son is using the same wagon on his farm today.

Think of the money that sturdy Studebaker wagon has made for every one of its four owners.

But that's the way with Studebaker wagons—they are a fine investment for they always pay dividends on the original cost.

Not the Cheapest but the Best

It is true a Studebaker wagon may cost you a few dollars more than a cheaply made wagon but when you consider the years of service you get from the Studebaker isn't it much the cheaper wagon in the end?

In fact, it is a safe proposition to judge your wagon by what it *costs you per year*.

Records prove that you can expect at least thirty-five years of service from a Studebaker. Figuring that way it is the cheapest wagon in the world.

Studebaker also makes Buggies and Harness warranted to give satisfaction.

Studebakers last a lifetime

DO you know there is only one plow guaranteed to leave no crop-killing air spaces? Only one plow that, with its peculiar auger-like shape, can go into stubble, tame sod, trashy corn ground, pasture, etc., without changing bottoms? This plow *increases your crop 2 to 10 bushels per acre*. Figure this at the tremendous prices for your grain this season.

There is only one plow for which these strong claims can be made and backed to your entire satisfaction—the

ROCK ISLAND "CTX" Universal Plow

Learn all about the Famous "CTX." Saves buying extra bottoms. Pulverizes better and saves at least one harrowing. Turns slice *clear over* and *buries all trash*. Work saver and money saver. Write today for handsomely illustrated, Free "CTX" Book; see what this plow saves, what it costs, and *what it is doing for other farmers*. Postal brings book.

Vol. VII March 1, 1915 No. 5

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim nad we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always enclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

With good prices promised for most all our crops this year we should make strenuous effort to raise big crops while the prices are good.

—o—

The greatest single loss among live stock men is that caused by hog cholera. If this can be saved by a little care and common sense, would it not be to our great advantage to do it?

—o—

When you see the water from the spring rains carrying tons of your best soil down toward the Gulf of Mexico during the next few weeks, better pass a resolution to seed down some of your hill-sides in grass and get a few good cattle to turn the grass into money.

—o—

Last fall we saw hundreds of bushels of apples offered at 40 to 50 cents a bushel and they were high at the price —they were full of worms. Sprayed apples at the same time were bringing a dollar a bushel and were worth the money. The man who offers wormy apples for sale these days when we know how to prevent them ought not to make any claim of "knowing how to farm."

—o—

The man who has a good herd of dairy cows and has been buying mill feed and alfalfa hay to get them through the winter, may feel like there is not much money in dairying, but when he gets that fine lot of rich fertilizer spread over the corn ground and watches with pleasure the rank, dark growth of the corn next summer he will then feel like the money he spent for feed has just begun to draw interest at a good rate. The time has come when we must consider the fertilizing value of the feed we buy for our extra live stock.

—o—

It is time right now to begin to get ready to sow a field of alfalfa. Hundreds of farmers have bought feed this year who could have saved that expense had they had a good field of alfalfa last year. In some instances it is safe to sow alfalfa in the spring just as we do clover, on wheat or oats. A great many farmers have reported good results this way. But a safer plan is to get the ground ready in the early summer and sow the seed in August. Sow the field in oats and mow the crop off early for hay and then it is in good shape to prepare for alfalfa. Possibly a better way is to wait until the weather is warm and sow the ground to an early maturing variety of cowpeas or soybeans which will leave the field in the very best condition to follow with alfalfa. We can not afford to pay $20 to $30 a ton for mill feeds when we can grow three or four tons to the acre of alfalfa that will take the place of the expensive feeds. Let us resolve now to sow a field of alfalfa in 1915.

—o—

WHAT HAVE YOU DONE?

In recent issues of The Missouri Farmer we have discussed the need of a better system of rural credits and a plan to put the system into operation in Missouri. We have a chance to take the lead in this matter and we think the plan now before the Legislature, which we outlined in our last issue, will be a splendid encouragement to the agricultural interests of the state if it can be enacted into law. But what have you done, dear reader, to help this thing along? If each one of the fifty thousand farmers who regularly read this paper would write their members in the House and Senate of the State Legislature and urge the passage of this bill it would be done before adjournment and no mistake about it.

It matters not whether you are a land owner free of debt, a mortgaged-land owner, a tenant or a hired farm hand, you ought to be vitally interested in anything that will encourage and help farmers to own the land they occupy. We have no prejudices against the man who now owns land and is holding it as a good safe investment—there will probably always be a reasonable number of such holdings—but we think it is a universally accepted economic principle that the country having a wide and general distribution of land ownership is on a sounder and better basis than the one under a system of landlordism. The man who owns a farm debt-free may not feel a personal need for lower rates of interest on farm mortgages but he surely can see that others of his neighbors or possibly his own boys who will soon branch out for themselves will be benefited when this plan is put into operation.

For the man who is struggling under a debt that takes about all his surplus to pay the present rate of interest it would be a great encouragement and put new life into his work if he could take up his old mortgage with one bearing no greater rate of interest that would gradually liquidate the debt in a few years. Year by year as he saw his debt reduced and a debt-free home in sight he would feel like taking a greater interest in better roads, better schools, better churches and all other things necessary for the welfare of an intelligent and thrifty people.

If you want this bill passed which will give land owners long time loans at a low rate of interest and without a cent of cost to the state, better write your representative and senator at once. The measure now before the Legislature is the one outlined briefly in The Missouri Farmer February 15, and is generally referred to as the Gardner Bill because first suggested by Col. F. D. Gardner of St. Louis. This bill was introduced in the Senate by Senator Craig of Nodaway County, and in the House of Representatives by Hon. Noah W. Simpson of Lewis County and has been endorsed by C. O. Raine, master, Missouri State Grange.

This is decidedly the best plan we have seen suggested so far and we know it will prove a great help to agriculture if it is put into operation.

—o—

FARM ORGANIZATION

The older our country and the better organized all lines of business become established, the greater the need for some strong central organization for farmers. Farmers can not afford to grope along in an independent way when every other industry is so thoroughly organized in their own special interests. Take organized labor, for instance. What labor demands may indirectly concern the farmer. The farmer being classed as a laboring man is naturally in sympathy with anything looking to the betterment of laboring people, but when the demands of labor become unreasonable the farmer in his own defense must take some action and the only way to do it is through some official body. One matter in point is that of the demands of railroad engineers and firemen for an increase in pay which is now before a board of arbitration in Chicago. The fact is that these men are already much better paid for their labor than farmers, and if we allow them to go on and demand unreasonable salaries and make unreasonable rules that will cost the railroads millions of dollars unnecessarily, then as a matter of course passenger and freight rates must be increased to meet expenses and here is where it concerns the farmer.

There are two old established orders that deserve the confidence of the farmers, the Grange and Farmers' Union and we would like to see both these splendid organizations encouraged and supported by the farmers of Missouri.

—o—

CRITICISING THE LEGISLATURE

There has been a great deal of discussion in the newspapers lately about the attitude of the present Legislature toward the University at Columbia and a number of the writers go so far as to charge that the members of the Legislature are hostile to the University and that they want to cripple this great educational institution in its work. We do not take any stock in these charges for we know the average man who goes to the Legislature is as honest and as loyal to his state as the average man who is on the outside. The fact is that there is only about eleven or twelve million dollars available for all purposes for the next two years. Missouri has a large number of institutions, eleemosinary, penal and educational and they must all be taken care of. As the state develops every one of these institutions must try to keep pace, but if the revenues of the state fall a little short of the needs it may be necessary for all the institutions to curtail their sphere a little rather than to cripple any one institution. Those in charge of our state institutions should remember that this is a time when thousands of indiviuuals are economizing to the last cent and it is the duty of the Legislature to economize in public expenditures. In times like these state institutions may consider themselves fortunate if they are able to maintain their work on the basis of the last two years.

Another thing, the members of the Legislature can well afford to consider of first importance those things that give the people direct results and ready returns. Take for instance state aid to rural schools and high schools. Every dollar expended in this line gets to the people who need it most and who need it at once. Then in work like the control of live stock diseases and insects which we discussed in a recent issue the results are apparent every day and this kind of work can not wait without great loss to individuals as well as to the state. There is entirely too much scolding and fault finding with the Legislature and we think this is a time that all should show a spirit of co-operation rather than criticism.

Farmers lost millions of dollars last year from hog cholera, army worm, chinch bugs, Hessian fly and other pests that might have been greatly reduced under a state-wide campaign by the State University or the state board of agriculture. These are things the Legislature could well afford to care for if it were necessary to cut down many other appropriations which are made annually which are of little or no economic importance. Certain state officials are neglecting their duties and taking up their time lobbying with the members of the Legislature for increased salaries, more help and enlarged appropriations for things of doubtful value and then if they fail to get what they want they try to discredit the members with the people. Let these people who are finding fault with the Legislature tell us how to get more revenue and how to care for the hundred and one things that are of vital interest to the general public.

—o—

GET RID OF HOG CHOLERA

There are few hog raisers in the state who have not at some time in their experience with hogs sustained loss from hog cholera. We lose millions of dollars annually from this one cause and yet in the light of what we now know this loss ought to be saved and can be saved if the farmers will follow the methods of sanitation and co-operation recommended by Dr. Connaway of the Experiment Station. Every farmer in his own behalf must keep his own premises clean, but this is not enough—his neighbors must do the same thing. Any farmer may take every precaution and if a careless neighbor allows the carcasses of dead hogs to lie around for dogs, buzzards and crows to carry about, the man with clean premises is in constant danger of an outbreak in his herd.

During the past five years The Missouri Farmer has constantly kept this matter before our readers and warned them against the dangers of the simultaneous treatment and the poor sanitary measures usually practiced in the state. We have given figures to show what has been done in Dade, Johnson and other counties, and if the plan of organization in these counties were put into effect in the entire state there is no question but what we would soon be practically rid of this great loss.

NOTICE TO SUBSCRIBERS

The great number of renewals we have received during the last few weeks has made it impossible for us to give credit on our subscription list with the usual promptness. If, therefore, your subscription hasn't been marked up in the issue after you made your remittance, don't worry. The credit will be give as speedily as we can reach it. Through the employment of some new and inexperienced office help, the second letter on renewal of subscriptions was recently mailed to a number of readers who had already remitted. We regret this unfortunate mistake and promise our subscribers that it will not happen again. In conclusion, we hope that those of our readers who have not yet renewed their subscriptions will do so promptly before they get busy with their spring work.

THE MISSOURI FARMER.

EIGHT YEARS SILO EXPERIENCE

We built our silo in the summer of 1907 and have filled it eight times; it is 16x30, made from two piece cypress staves 24 feet in all, set on six foot concrete basement; top of foundation is six inches above level of barn floor, walls 12 inches thick, concrete floor. The staves show no sign of decay.

In filling we use a cutter which has knives and blower on fly wheel; cut one-fourth inch in length as it packs much better in short lengths. Have had from one to three men in silo and find it pays to use three. In the field have used corn binder, sled cutter and knives. We find the binder much the best. Have always had to use a steam engine for power, paying from $5 per day the first years to $9 later. We have used more or less water on silage every year but have at times put in some without water and have found

Silo on Lewelling Farm

that small mouldy spots often occur when silage was not wet enough.

We have always tried to cut the corn about a week before it would do to shock, when most of the grains are well dented and the shucks and the lower blades are yellow and have always had good sweet silage. We have tried Kafir corn and cowpeas which made good silage, but prefer corn with plenty of ears on it.

On my father's farm of 180 acres we keep 35 to 40 Jerseys, 6 to 8 horses and mules, 20 to 40 sheep, 10 to 20 hogs and a flock of chickens. We feed silage to everything except hogs and poultry.

During the first few years it cost from $65 to $70 to fill the silo but during the last two years, several of the neighbors have erected silos and by exchanging work (a sample of co-operation) the actual cash outlay has been greatly lessened.

The first year we put all of our corn in the silo and then did not have it quite full. That fall we bought a manure spreader and since then have filled it from a smaller number of acres, although we would rather put all the crop in the silo than fail to fill it. With the small cutter which we have, it takes two and a half days for filling. This allows more time for settling and we can put more material in the silo. In 1914 we filled our silo from 18 acres.

W. W. Lewelling,
High Hill, Mo.

SILOS ARE FEED SAVERS

I have two one-hundred ton silos. One is a two-piece fir, the other is a one-piece fir creosoted. I have used one three seasons and the other one season. I think they are feed savers. I have fed a bunch of heifers every year since I put up my first silo and they have made me money. I also feed silage to my milk cows, brood mares and all other horse stock. I have never had any experience with a concrete silo. I think all farmers should put up a silo.

L. M. Swarner,
Cooper County.

Every up to date farmer needs a good manure spreader—and especially this year when you should utilize every pound of available fertility on the place. In this issue of The Missouri Farmer you will find several reliable spreaders advertised and we suggest that you write the manufacturers and ask them to send you their literature. It will tell you a lot of things on soil fertility you have never thought about.

Send us a check or a dollar bill and let us renew your subscription for three years before you get busy with your spring work. Do it today.

It's just another of the ways that Studebaker MAKES SURE. You see, steels are so important in the building of a car that Studebaker takes no chances. When designing the car, before it ever gets as far as the shops, Studebaker metallurgists study the duties of *each* of the parts, and decide just what kind of steel is BEST to use.

Then the steels are made just as they specify. And they come to the plant and are tested—time after time. And THEN, when the drop forgings are completed, they go thro' not one, but a whole series of HEAT-TREATING operations, like the one pictured here, that give them that tough, tensile, LONG-lasting quality that Studebaker Cars are famous for.

It's expensive, to be sure, but it gets into this FOUR quality that gives the car extra safety and makes replacements rarely necessary. It makes the car BETTER. And you know, as your fathers knew, how eager Studebaker is to go to any expense that will make Studebaker products BETTER.

So when you come to see this FOUR at your local Studebaker dealer's please STUDY its whole construction, and see how Studebaker, with its close knowledge of what the farmer needs, has built this car to give day-by-day SERVICE and convenience on *country* roads.

Study its balance, its alignment that makes the car EASIER riding and so EASY to drive that it answers to the touch of *two fingers* on the wheel. Study that long-stroke, high-speed motor with its over-abundance of POWER.

Get the dealer to tell you of the National Service organization that Studebaker has built up, so that wherever you drive you can always get Studebaker Service. Study every little detail—and be CRITICAL.

Consider how much you get for $985—and then, decide if this isn't the car *you* want

—because it's a

FOR A BIGGER CORN YIELD

It is well known that seed corn from apparently good ears and ideal stalks often proves of inferior yielding quality; differences in such selected seed running as high as ten bushels per acre. This means that the same labor, the same soil, and the same or nearly the same amount of plant food results in the maximum yield in one case and in the minimum yield in the other. If the cause or causes of the minimum yields were known, it might result in a uniformly maximum yield seed. In other words, a poor crop is not wholly due to weather, soil or cultural conditions; but is often due wholly to poor seed and nearly always at least partly due to poor seed.

Figure 1—The Seed Ear. It's silk was pollenated from a barren stalk

The testing of seed corn for strength of germinating power enables the farmer to distinguish and throw out seed ears found defective in this regard; but there still remains the puzzling circumstances that an ear may have good germinating or "starting" character and still produce poor ears and an undue proportion of barren stalks.

It Takes More Than Seed Selection

With the view of securing good seed the plan was devised of testing the individual ears by using part of the ear one year in a test row, thus finding out the productive ears, and raising seed from such ears thereafter.

This rather painstaking procedure resulted in markedly better yields. It did not, however, result in corn which in after years maintained the maximum yield. Something happened to it which, in a greater or lesser degree, brought the yields from those obtained from this original, tested ear back to the lower and average yield.

Manifestly the thing that happened was connected with the "breeding" of the corn in the field in the subsequent years. Something weakened its virility.

"Well bred seed corn, by inattention in selection may deteriorate within a few years." (East.)

"The smallest ear sometimes yields the greatest amount of grain in the next generation, because from a strain possessing to a remarkable degree the power of transmiting good yielding qualities. Although small, possibly from its particular environment, it nevertheless had these qualities."

"Effects of inbreeding tend to accumulate from year to year."

"The hereditary effect of probable inbreeding upon the yield in a breeding plot was determined (ascertained) and it was found that the crossed rows yielded in the second and third years an average of about ten bushels per acre more than the tasselled rows."—And, in a footnote, "Barrenness probably not transmittable, but we should always act on the safe side on disputed questions."—Ill. Ex. Sta. Bulletin.

Why Barren Stalks?

Since the percentage of barren stalks varies from year to year with the varying growth-conditions, it is manifestly true that at least some of them are barren because of growth-conditions.

And inasmuch as certain stalks are found to be barren although growth-conditions are particularly favorable, it would also seem to be true that those stalks were barren because of an inherited tendency to barrenness.

It is, moreover, possible that heredity has something to do with the barrenness of the first-mentioned sort as well as the last-mentioned. Both may have a "blood taint" inherited from one or both parent plants or their more remote ancestry. One is a barrenness arising from unafovarble growth-conditions and coupled, possibly in some cases, with inherited taint; the other is one arising from an inherited taint. One taint, if present at all, is so slight that ear production occurs when favorable growth-conditions exist; but the other is so strong that ear-production does not take place under growth-conditions howsoever favorable.

It is conceded that weakness in the corn plant is caused by inbreeding as with the other things; that it is caused by crowding and consequent starving; that it is caused by all unfavorable growth-conditions; but does barrenness in corn tend to perpetuate itself?

Is barrenness an inherited character?

Figure 2—Crop from Seed Ear shown in Figure 1. 25% of stalks were barren

Does the barren stalk itself tend to reproduce its kind?

With a view to obtaining the answer to this question the writer has made some experiments. They are inadequate in number and should be carried on much further; but they are sufficiently significant and suggestive to be taken into account, since they answer the question, despite their inadequacy, in pretty strong terms.

Figure No. 1 is an ear of corn which in 1913 was covered over with cloth before its silk appeared. Thereafter, when the silk was ready it was pollenated from a nearby barren-stalk tassel. Therefore the rows of corn grown from this seed a year later (shown in Fig. No. 2) was fathered (pollenated) by the barren stalk before mentioned. The plat is one-sixtieth of an acre. One-fourth of the stalks were barren.

The growth-conditions during the summer of this year were unfavorable; and the average number of barren stalks in the fields planted with seed grown the year before and having the natural field pollenation was ascertained to be fifteen per cent. Counts were made in neighboring fields having poorer soil, as well as distant fields, and in fields planted with seed gathered from the same field and of the same variety as that in the plot in question, (Fig. 2). The average was fifteen per cent, as stated.

Barrenness Can Be Bred Out

The ears of corn, nubbins, etc., gathered from the plat Fig. 2 and grown from the barren stalk pollenated ear, Fig. 1, are shown in Fig. 3. There are twenty-four pounds of shelled corn. The plat is one-sixtieth of an acre so that the yield is at the rate of 25 40-56 bushels of shelled corn per acre.

A similar number of ears were selected from a field having poorer soil, taking ears, nubbins, etc., consecutively, as they came in the row. They are shown in Fig. 4. They are the product of field pollenated seed; and gave twenty-eight pounds of shelled corn, which is at the rate of 30 bushels per acre, if from the same area of ground. That is, the same number of ears as shown in Fig. 3 weighed four pounds more, picked as they came in the row. Barren stalk pollenation resulted in seed that produced 25% barren stalks, 75% ear stalks; and 25 40-56 bushels per acre; whereas field pollenation resulted in seed that produced 15% barren, 85% ear stalks and 30 bushels per acre. The average weight per ear in shelled corn (not weighing the cob) is 4 31-100 ounces for corn with the barren stalk parentage and 5 4-100 ounces for the other corn.

If there had been no barren stalks, no barren stalk direct parentage so far as known, and two ears per hill, the yield would then be 35 16-56 bushels of shelled corn per acre.

Based upon the foregoing, if seed corn is gathered from this year's fields, with their 5.04 ounce ears and 15% of the stalks barren; then unless next year's growth conditions are better than they were this year, that 15% of barren stalk pollen has transmitted its characters to this year's seed to the extent of reducing next year's yield one-half bushel per acre.

How much more corn could the ear stalks in this year's acre have grown with the plant food taken by the barren stalks?

It produced the stalks required for 30 bushels of shelled corn per acre and also raised enough barren stalks to have supplied nitrogen-free extract and fat for six additional bushels of shelled corn and their cobs, and enough protein for three and four-fifths bushels.

Barren Stalks Are Drones

So that if it was a matter of plant-food, the barren stalks used up enough to have made the yield closely approximate 35 bushels, poor rainfall and all.

Since writing the foregoing I have been given access to and the use of "A Study of the Phenomena of Barrenness in Corn," a manuscript thesis by Professor Frank H. Demaree, now the County Farm Agent of Grundy County, Illinois. His thesis was based upon his experiments while at the Missouri State Agricultural College in hand pollenation from barren stalks; experiments much more elaborate and more to be relied on than those herein noted. He makes the barren stalk an even worse malefactor than I do;—perhaps because he found out more about it. Moreover, much light is thrown on the difficult art of detecting it in the field.

Some Missouri Experiments

Certain conclusions to the treatise are both instructive and useful. They are as follows:

"There are two forms of barronness exhibited by the corn family. Certain stalks may be found which are absolutely barren and yet are growing under very favorable conditions. Barrenness may be induced by crowding, by lack of plant food on a poor soil and by weakening the vitality of the seed as in the case of inbreeding. The first form is hereditary but there is no reason to suppose that the latter can be inherited.

"Fertilization of good ears from pollen of the first type of barren stalks produces seed which under all conditions throws a much higher percent of barrenness than does seed with no known barren tendency.

"Increasing the stand under similar conditions increases the number of barren stalks produced in direct proportion to the increase in stand. This is evidently due to the effect of crowding, bringing out any weakness which may exist in the individual stalks.

"Inbreeding according to work done here seems to decrease the vitality and vigor of corn, causing a greater percent of barren stalks to appear.

"Poor soil in which available plant food is badly lacking is one of the most fertile causes of barrenness.

"A typical barren stalk is round, tapers from the base to the tassel, the leaves and sheathes are thick and fleshy and the stalk is full of sugar upon ripening. There is generally a good deal of red color exhibited in all parts of the plant at maturity. Seemingly on account of the fleshy leaves and sheathes the leaves assume a peculiar upstanding posture which is quite characteristic of the stalk.

"There is a wide range in the percent of barrenness produced in the different varieties of corn which is probably one of the most fertile causes of the inability of those varieties to yield larger amounts of grain.

"Individual ears of any variety show a wide range in the number of barren stalks produced. This is another evidence that some of the kernels on those ears were fertilized by a barren

Figure 3—Ears from crop shown in Figure 2. Twenty-four pounds when shelled. 25 40-56 bushels per acre

stalk and the tendency to barrenness was transmitted to the progeny.

"Chemical anlysis of barren and good stalks shows that barren ones contain more protein, fat and nitrogen free extract than the productive. The difference is not great enough, however, to say that the food which would normally have gone into the ear is lodged in the stalk."

Figure 4—Ears from like number of consecutive stalks grown from field pollenated seed. 15% of stalks were barren. Twenty-eight pounds shelled corn. 30 bu. per acre

The barren stalk takes up the room and soil-fertility needed for ear-stalks.

It pollenates ear-stalks and when such ears are used for seed the progeny tend to reproduce barren stalks in greater proportion than the proportion of barren stalks brought about through environment and other conditions.

Its weakening influence on the ears pollenated by them reduces the size and weight of the progeny of such ears.

Preventing inbreeding of seed corn by detasseling the seed ears is but a half-way procedure so long as these ears may be pollenated by barren stalks.

The doing away of barren stalks and of inbred seed promises a greater increase in the corn crop than any similar amount of effort and expense otherwise expended.

Not only should there be no barren stalks in the field and no inbreeding pollen on the seed rows on a few farms; but there should be none on any adjacent farms, since one such tassel contains enough pollen grains (30,250,000) to supply and damage 30,000 ears of seed corn, and these grains may be borne through the atmosphere to neighboring fields.

Geo. K. Andrews.

PRODUCTION AND CARE OF FARM MANURE

The composition of barnyard manure is subject to such wide degree of variation that it is impossible to assign to it any fixed value that will apply in all cases. This will readily be understood when we consider that different kinds of animals, kind and quality of food, and the quantity and quality of bedding all have a direct influence on the composition of the manure produced. For instance, manure from horses and swine is somewhat richer in nitrogen than is that from cattle; while sheep manure contains a higher percentage of both potash and nitrogen than do either of the others. As a general thing animals, which are being fattened, return in their excrements a larger percentage of fertilizing materials contained in the food than do young stock making a rapid growth, or dairy cows in full flow of milk. A rapidly growing animal requires a large amount of mineral matter and protein compounds for building up the bones, muscles and tendons of the body, and consequently a considerable part of the fertilizing elements in the food are retained for this purpose.

Probably not over 50 per cent. of the phosphorus, potash and nitrogen in the food would be recovered in the manure from a vigorous young animal. Milk cows and fattening animals, however, will probably return in their excrements from 65 to 80 per cent of these materials.

Since such a large proportion of the fertilizing ingredients in the food is recovered in the fresh manure, it naturally follows that foods having a high content of these elements of fertility will produce manure correspondingly rich in these same materials. For example, an animal fed on clover or alfalfa hay, oil meal, cotton seed meal, bran, etc., will produce manure of relatively high fertilizing value; while such materials as straw, root crops, and the like, would give a product of rather inferior quality.

A Concrete Floor Profitable

After the manure has been produced, the next step is to care for it properly. The first essential in taking care of the manure crop is to provide a durable, water tight floor in the stable. For this purpose there is probably nothing better than concrete. Such a floor, properly constructed, will be impervious to water, and, by the liberal use of litter to absorb the manure liquids, the loss—which is bound to occur on an earth floor—would be practically eliminated. About the economy and practicability of such a stable floor and also the concrete floors in feeding lots, there is no question. Experimental evidence proves that a concrete floor is not only a paying investment but that the actual cost of putting it down will, in a few years, be returned many times over by the saving of fertility in the manure.

Although there is this loss of fertilizing ingredients where animals are kept on an earth floor, the most serious losses are likely to occur after the manure has been removed from the stable. This is largely due to the very common practice of storing manure in open yards. When manure is stored loosely in large piles, fermentation begins very quickly and much of the nitrogen that it contains passes off into the air in the form of ammonia gas and is lost. A large part of the soluble protein of the manure will also be carried away by the leaching effect of the winter rains and melting snow, so that by the time spring arrives the manure will probably not contain over 50 per cent. of its value at the time it was removed from the stable.

Haul Manure Directly From Stable

A much more satisfactory practice, and one which will give greater financial return, with a less expenditure of labor, is to draw the manure directly from the stable to the field, whenever it is possible to do so, and apply with a manure spreader. Experiments at the Ohio Station have shown that manure so handled is worth at least 70 cents per ton more than the same quantity of manure similarly applied after lying for three months exposed to the weather in an open yard.

Because of the fact that it is not always possible to get on to the fields with team and spreader at all times during the winter, due to weather or other conditions, a manure shed becomes a very valuable adjunct in caring for this important crop. Such a building may be constructed very cheaply and has many decided advantages over storing in an open yard. At times, when the ground is too soft to admit of hauling out the manure, it may be thrown into the shed, spread out evenly over the floor and allowed to remain there for a few days until it can be drawn to the field and spread. In this way the manure will be protected from rain and snow, and, if the shed is provided with concrete floors—and it should be—and plenty of litter used to absorb the liquids, the amount of loss will be comparatively slight.

Manure Pit and Manure Shed

The shallow concrete manure pit out of doors is a practical means of taking care of manure and is to be recommended.

Where a manure shed is used, it should be so arranged that stock may have free access thereto. In this way the manure will be kept well packed down by the animals tramping over it, and the danger of loss due to burning and excessive fermentation very materially decreased.

Barnyard manure, however, is not a balanced fertilizer for ordinary farm crops; it is relatively high in nitrogen and potash and correspondingly low in phosphorus. Experiments conducted by the Indiana Station show that most clay soils of the state are deficient in that same element, phosphorus. By adding some phosphatic material to the manure as it is produced, we are able, not only to supply the lacking element, phosphorus, but also to fix the nitrogen, to some extent, and thus prevent its escape in the form of ammonia gas. The following table, taken from the Ohio Experiment Station, (Circular No. 144), shows that this is a very profitable way to handle the manure.

Each ton of manure treated with	Total gain in value of crops per ton of manure		Net gain per ton of manure due to treatment	
	Yard	Stall	Yard	Stall
Acid phosphate 40 lbs., cost 28c...	$4.22	$4.89	$1.62	$1.58
Rock phosphate 40 lbs., cost 20c...	3.54	4.47	.94	1.16
Untreated	2.60	3.31		

In the experiment quoted above the stall manure was hauled directly to the field; the yard manure was first exposed to the weather for three months.

In applying manure to the soil it is neither necessary nor desirable to put on excessive amounts, as is so frequently done. Very heavy manuring is wasteful. If manure has been cared for properly, excessive applications are not necessary to supply sufficient food for plant growth. Ordinarily, it is much better to apply moderate quantities and cover more ground than to give

Cushman 4 H. P. Truck
For All Farm Work

This is the light-weight, quick-action Truck Outfit that has proved so handy for farm work. So light a boy can pull it around from job to job—yet it easily handles all work up to 4 or 4½ H. P. **Runs at any speed** desired, speed changed while running. Pump circulation to water tank prevents overheating even on all-day run. **Cushman Light-Weight Engines**—4-Cycle—4 to 20 H. P.—are the most useful for farm work, as they do everything heavy engines can do and so many things the big clumsy fellows can't do. Also require less fuel. 4 H. P. weighs only 190 lbs; 8 H. P. only 320 lbs. **Throttle Governor** gives steady power. Friction Clutch Pulley On truck or skid. **Not a cheap engine,** but built to run without trouble. Engine Book free.

Why You Save Work and Money with the Shaft Drive

HERE you see a top view of the Janesville corn planter. Note the freedom from needless parts. The construction is simple—easy to handle—easy to take care of.

In using the shaft drive we reduce the number of operating parts generally needed on a corn planter. We discard the clutch—we free you from chains, sprockets, springs and possibilities for gumming up, breakages and needless repair bills. We assure you of having your planter in running shape all of the time. You are not held up waiting to replace broken parts.

Instead of giving your planter a kerosene bath at every round, you grease this shaft drive once a season. Any part showing a flaw in material will be replaced free of charge during life of machine.

Why not save work and worry this year and for many years to come by getting a

JANESVILLE CORN PLANTER
Manufacturers of Farm Implements
The Only One With The Shaft Drive

Here is another feature that you will like on this planter. It has a sight feed. You can see every hill as it drops. You can change the feed without stopping the team—drop two, three or four kernels to the hill as the soil will stand. Here's the best construction for handling silage corn.

You can provide for any quantity of seed corn per acre. Commercial fertilizer attachment, as well as cow pea attachment also, can be furnished.

80 rods of wire, a reel, a disc marker, a full set of edge drop as well as flat drop plates for checking or drilling, furnished with each machine. Made in following models: checking and drilling, drilling only and lister planter.

J. F. Gregory, Dept. 74 St. Louis, Mo

one field a very heavy application and allow another to go without any. Furthermore, where heavy manuring is practiced, the growing crop is unable to make use of all the plant food provided and part of it is therefore carried, by percolating water, down into the soil below the range of plant roots, or is lost in the drainage waters. As a rule it is not necessary to apply more than 8 to 10 tons and 6 tons per acre is usually more economical.

For spring grown crops especially, better results will usually be secured by applying manure during the previous fall and winter months. In this way the soluble plant food will be washed out of the manure and into the soil.—Purdue Agriculturalist.

HOW TO RAISE PROFITABLE CORN

Today, January 22nd, wheat closed at $1.43½, corn at 79⅛ cents and oats at 56¼ cents. These are among the highest prices recorded on the Chicago Board of Trade. At this writing, Europe is taking millions of bushels of all kinds of grain, and the prospect is for a greater demand and higher prices by the coming fall. Judging from present conditions, the American farmer has never had a greater opportunity to realize more from his corn crop.

There are five cardinal principles that lead to big yields of quality corn. They are, good seed, well fitted soil, proper planting, sufficient and the right kind of cultivation and an abundant suply of well balanced plantfood.

There is an old law in plant and animal breeding that like produces like. When you plant poor seed corn, you get a poor crop. Select a variety that always matures before frost in your locality. Test out your seed corn, and do it early enough to obtain strong seed corn from another source should the vitality of your stock be weak. To plant a single ear that will not grow, means a loss to you of from $4 to $6.

Most land of the Middle West will grow a good corn crop, provided it is well drained, has sufficient organic matter, is warm and contains an abundance of suitable plantfood.

Drainage is vitally important. Undrained land is cold, soggy, slow and often sour. The use of lime will make it sweet but will not take the place of good drainage.

Soil is not dead. There are millions of tiny forms of life in it. Some are beneficial and some harmful. These tiny forms of life, bacteria, liberate ammonia which supplies nitrogen for your corn crop. To turn under leaf mold, sod, stubble, straw and manure, provides the organic matter which is the home and food of desirable soil bacteria. The organic matter binds together loose sandy soil and loosens heavy soils. In decaying, it gives off carbonic acid gas which,when dissolved with the water in the soil, forms a weak acid which dissolves out unavailable plantfood and makes it available. Organic matter is most important.

If you do not plow your corn ground in the fall, plow it as early in the spring as possible and prepare a fine seedbed before planting. This helps to conserve soil moisture and as a single bushel of ear corn requires over 500 gallons of water, the importance of moisture conservation can readily be seen.

It is just as important that two to three kernels are placed in every hill or a kernel placed every 12, 14 or 16 inches in the row, as it is for the kernels to be tested. Test out your corn planter to see whether it works properly before planting. Test the fertilizer drop at the same time. Do not plant corn too deep.

Cultivate often but shallow. Corn roots come close to the surface and deep cultivation cuts off these roots. Do not hill up your corn, as this practice exposes a much larger percent of soil surface to drying winds and sunshine than does level cultivation.

To mature any crop of corn, requires a definite amount of ammonia, available phosphoric acid and potash. There is a definite quantity of these compounds in our soils, as are revealed by chemical analysis, but the form of this plantfood is constantly changing from available to unavailable forms. It is impossible to say from any type of test, except the growing crops just what shortage or an essential plantfood there is at any given time.

Ammonia, available phosphoric acid and potash in turn cause rapid stock growth, ripening and filling of ears, and growth of strong stalks. The nonperformance of any of these duties, indicates a lack of a particular compound. Good soil preparation must go hand in hand with proper supply and balance of plantfood if best results are to be obtained.

Conserve your manure supply and use all the manure that you can secure. Manure not only supplies plantfood ingredients, but it also improves soil conditions. Plowing under green crops or adding organic matter in any other form performs the same functions but when you add up all the materials supplied in the above forms, you will find that it does not supply plantfood in amounts sufficient to provide for the needs of maximum crops and to maintain soil fertility. The above cannot be accomplished without some supplement to manure in the form of a fertilizer containing available plantfood in proper proportions to make up for the deficiencies of the soil and to meet the needs of growing plants.

The tiny corn plant must have easily digested food. Throughout its growth it must have the important plantfood elements in an available form, for it cannot use them until they are dissolved by soil, water and plantroot juices. Fertilizers supply these elements in soluble form.

Very early in spring, soil nitrogen is largely in an organic form which is not available to the plant until nitrogen-forming bacteria have acted upon it and these bacteria do little work until the soil has reached a temperature of 50 degrees and they do not do their best work until the soil has reached a temperature of 80 to 90 degrees. By adding suitable fertilizer you supply available nitrogen to the tiny corn plant and give it a much quicker start than if it had to depend upon organic nitrogen.

The season of ear filling is short and from 60 to 75% of the phosphoric acid contained in the corn is in the ear, hence a large amount of available phosphoric acid should be used on the corn crop. Available phosphoric acid also helps to hasten the maturity and increases the weight of the ears, thus increasing yield. Potash strengthens the stalk, helps to make well filled kernels and increases the yield. It is just as important that your corn be supplied with a well-balanced ration of digested plantfood, as it is for the cattle in your feed lot to have a well-balanced ration of digestible food.

It is not difficult to find machinery that will distribute fertilizer properly. When you make medium to heavy applications it is a general rule to apply two-thirds of the fertilizer with a fertilizer attachment of the grain drill just before planting and the other one-third of the fertilizer in the row through the fertilizer attachment of the planter. If you decide to use only 125 pounds or less per acre, put all of it in the row through the planter. If you have to apply the fertilizer broadcast, be sure to work it thoroughly into the soil before planting and use 50 to 100% more than if you were applying it through the drill.

On corn, 200 to 500 pounds of a high-grade fertilizer should be used. Generally speaking, on sandy soil it should analyze from three to four per cent ammonia, eight to ten per cent phosphoric acid and four to five per cent potash; on loam soils, one to two per cent ammonia, ten to twelve per cent phosphoric acid and three to four per cent potash; on clay soils, two to three per cent ammonia, eight to twelve per cent phosphoric acid and two to three per cent potash. In this connection, however, it is difficult to prescribe fertilizer applications at long range. Previous cropping, previous applications of manure, the amount of organic matter in the soil, the rotation and the appearance of the previous crops together with their final yelds and quality must all be taken into consideration.

IMPORTANCE OF THE ANGORA AND MOHAIR INDUSTRY TO THE UNITED STATES.

The importance of this industry is not realized by the average citizen, and the direct bearing it has on the development of the country is overlooked by farmers in general and live stock raisers in particular. It is not necessary to go into detail in showing when the first Angora goats came here or why they are here. Suffice to say, they are here, and we can safely say they have come to stay.

Briefly, however, the first Angoras were imported into this country in 1849. The then Sultan of Turkey desiring to pay a compliment to the work done by Mr. Davis, an American who had been sent to Turkey to educate the Turks in the raising of cotton, presented Dr. Davis with nine of the choicest Angoras in his domain. This action marks the beginning of the Angora industry in the United States. Their value as brush cleaners and weed destroyers was at once recognized, and for some time they were used only for this purpose. Later it developed that their fleece had a market value owing to the fact the peculiar texture of their fleece was essential for certain fabrics, and then it was that Angora stockmen began to grow them for their mohair.

The word "Mohair" is the technical name for the fleece of the Angora goat. According to George Fayette Thompson, M. S. author of the work entitled "Angora Goat Raising and Milch Goats," the word comes to us through the old French word 'Mohere' from the Arabic 'Mukhayyar' meaning Mohair cloth. It differs from the wool of the sheep in that it does not have the felting properties of the latter. The felting properties of the wool is due to the presence of scales or epithelium which cover the fibre in much the same manner that scales cover fish. It is the felting property of wool which distinguishes it principally from other animal fibres. Mohair is a hair proper, being devoid of scales, and so it is not successfully used alone in felt goods.

"The fleece upon the goat is pure white, it is exceedingly lustrous, and grows to an average length of 10 inches annually. It hangs in beautiful wavy curls or ringlets, from all parts of the body if the animal is of the best breeding. The average animal production per head of mohair is about three pounds." It will be noted that Mr. Thompson states "The average annual production per head of mohair is about 3 pounds." However, it is gratifying to learn that American intelligence has succeeded in increasing this average amount and it is safe to say now the average clip is three and one-half pounds, while there are hundreds of breeders of Angoras in the United States who have bands which will average five and six pounds or even seven pounds per head.

As a conservative estimate the average price of mohair is around 30 cents per pound, the average yearly clip per head should be from $1.00 to $1.50. There are hundreds of bands of Angoras in the United States which will double and triple this. However, I am speaking of the average.

Mohair is used for linings, ladies' dress goods, braids of all kinds, worsted goods, alpacas, silicians, imitation furs, portiers, rugs, carpets and novelties. Every traveler in the United States has enjoyed the comforts of a luxurious seat from mohair. The red and green plush in every railroad coach, so familiar to Americans, is made from mohair. Again the beautiful wigs, puffs and switches, displayed in the shop windows of our leading coiffeurs are products of the Angora. A later use for mohair has been found in the manufacture of automobile tops and cushions. There is one mill in the East which annually turns out mohair goods to the value of from 10 to 12 million dollars. This is only one, and there are some ten or twelve engaged almost exclusively in the manufacture of mohair goods. There is absolutely no possibility of a falling off in the demand for mohair products. On the other hand, the demand has increased, and is still increasing out of all proportion of the production of the raw material.

The question naturally arises why this condition exists? The answer is that the average American farmer and stock grower has not realized the advantage and profits to be gained by the raising of Angoras. Angora raising can be carried on by two classes of farmers and stock growers. The first is, the small farmer who has some brushy waste land on his farm which is an utter loss to him—places where grass does not grow—consequently, such lands are of no value for his cows and sheep, brush and weeds having taken possession. It is here that the Angora will prove his worth. His natural bent is to browse, while peculiar as it may seem, he prefers weeds to grass. Therefore, a small farmer can well afford to keep a few Angoras if for no other purpose than to clear up these waste places. Their value in this would be worth their keep, but in addition to this, they will yield a clip of mohair worth at least $1.00 per head, but more likely worth $1.50. The second class is the owner of large tracts of waste lands, who can utilize Angoras, by putting them on the foot hills and mountainous country found in nearly every state in the Union. Their natural tendency to browse and their adaptability to mountainous or steep and rocky country opens an avenue for using these tracts for which heretofore no use has been found.

One of the facts to which the American farmer and stock raiser is awakening is the realization that the grass is gone and that brush and weeds have taken the place. This is not only true on the small farm but it is true all over the country. Where formerly thousands of sheep ranged the hills and mountains, few are found now. It is on such tracts the Angora is perfectly at home. The brush and weeds which cattle overlook are the Angora's principal article of food, consequently a remarkable change is apparent. The grass follows the Angora. This is because the Angora destroys the brush and weeds, giving an opportunity for grass to grow. Hence it follows that when the stock growers have realized handsome profits from the sale of their mohair, they have also improved their range. .

Alva L. McDonald.

Good Dairy Rations.

The best rations for the dairy cow according to the most recent investigations of the Nebraska College of Agriculture are as follows for a 1,200-pound dairy cow of the proper sort and producing 30 pounds of milk daily:

Ration No. 1. Twelve pounds of alfalfa, 35 pounds of corn silage, 4 pounds of ground corn, and 3 pounds of bran.

Ration No. 2, where silage is not available. Fifteen pounds of alfalfa, 6 pounds of ground corn, 8 pounds of corn stover, and 2 pounds of gluten meal.

Ration No. 3, where neither silage nor alfalfa is available. Twelve pounds of millet, 12 pounds of sorghum hay, 2 pounds of ground corn, and 3 pounds of oil meal.

The Missouri Farmer can be no greater than the support of its friends makes it. If you believe it is fulfilling an important and useful mission in this state, won't you help out by sending us the renewal of your subscription at once?

FROM HIRED MAN TO LAND OWNER

When I was a young man in the state of Ohio I wanted to be a machinist above everything else, but my parents being poor in this world's goods, and being the fourth of seven sons, and blessed with a strong body and willing mind, I started out to make my way in the world. Having been born on a farm I naturally turned to the farm business. My first season of three months at $12 per month and the next season of nine months at $11 per month. That was back east. I came to northern Illinois the spring of 1887, hired out for the season at $20 per month. When I came west I thought I knew how to farm, but had to try to forget what I knew and learn all over again. But it was my lot to always hire out to a man that had more money than knowledge of his business. So I did not learn the best methods of farming as I might have done had I worked for more intelligent farmers. After working for three seasons I became dissatisfied and thought I could do better by working for myself, as I thought I had money enough saved up to equip myself with team and tools. So I rented a farm of one of the men I had worked for. In the meantime I had been paying my respects to a little "school ma'am" of the good old down-east Yankee stock that came to Illinois in the pioneer days. We were married in the spring of 1890. We did not take a wedding trip but went right to housekeeping. And strange to say after all the figuring I did to be sure I had money enough to set out in business I found I was in the "red" to the tune of $300. So we went to work as two ambitious young people can, we put out 60 acres of corn, 35 of oats and my wife was very successful in raising poultry and a good butter-maker. We raised a fairly good crop and were able to pay off all indebtedness, and buy more tools that we needed.

We rented two years and had the chance to buy a farm of 130 acres at $65 per acre. The farm was pretty badly rundown, the buildings were old but quite serviceable so we concluded to buy, and it was made possible by the aunt that took the part of a mother to my wife, lending us enough to put with the money my wife had saved teaching school so that we could borrow the rest from a farmer that owned land adjoining us. So when we were settled in our new home we were nicely located two miles from town with a debt of $7500 and paying 6% interest for most of the money. Those were trying times. From 25 to 30 cents a bushel of 75 to 80 pounds was considered a good price for corn. And two years I sold corn as low as 15 and 16 cents a bushel of 75 to 80 pounds. We thought we would be satisfied if we could pay for our farm in twenty years, but after eleven years we had paid less than a thousand dollars. In the eleven years we had all kinds of experiences, good and bad seasons, lost our first two children, doctor's bills to pay and all that goes to make life both interesting and burdensome. In August, 1902 I came to Clarence, Shelby county, Missouri, and liked the country so well I bought 320 acres for $37 per acre. Went back home and sold my Illinois farm to one of my German neighbors for $100 per acre. Made a sale and sold off all the live stock and tools I didn't want to bring with me to Missouri and moved with my family to Clarence the spring of 1903. The question has been asked in The Missouri Farmer the past month or two why farmers don't make more money? I don't think that question can be answered satisfactorily by any one individual. A young man started out in life by his parents on an 80 or 160 acres of land can't appreciate the advantage he has over the one that has had to make his way alone. It can be seen by my figures that if it were not for the advance in the price of land, making money on the farm would be a very slow process. One of the main reasons I have not made money was the lack of working capital caused by unfavorable seasons. In Illinois it was the wet seasons, until I tiled out the land. And here in Missouri the dry seasons. Yet I feel that I have been a success. Some of the old wise farmers shook their heads and said I would never make it as I paid too much for my land, both here and in Illinois. Land has more than doubled in price here in the past twelve years. And if it had not been for the three dry seasons the past three years I would have made a good showing besides the advance in land. When we came to Clarence there wasn't a street lamp in town, and such a thing as mowing the weeds from the road-side along your farm was unheard of. The hedge fences had not been trimmed for several years. Now Clarence is lighted by electricity, the roads are all well graded and the farmers keep the hedges well trimmed and weeds mowed in the road along their farms. They have taken on new life in their methods of farming and stock raising. Several from this community have attended Farmers' Week at Columbia the last few years.

I believe a young man has as good a chance to make his way in the world as ever if he is willing to try to walk instead of trying to fly or is willing to begin at the lower round of the ladder and keep climbing one round at a time instead of trying to start from where his father has reached after a life of hard toil. The poet must have thought the same when he penned these lines:

'Tis grit that makes the man,
The want of it, a chump.
The men who win,
Lay hold, hang on, and hump.

T. L. Muhlman,
Clarence, Mo.

THE AUTO-OILED AERMOTOR WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. The gear case, in which the duplicate gears run, holds two or three times as much oil as is required by the mill for a year of constant running, days, nights and Sundays. From the gear case the oil flows through every bearing in a continual stream. It goes out through the thrust washers in the hub of the wheel and is automatically returned to be used over and over again. No oil is wasted. This mill needs oiling but once a year. **Two quarts of oil in the gear case of the 8-foot Auto-oiled Aermotor will keep the gears and every bearing flooded with oil for a year or more.**

The galvanized helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The old Aermotor was known the world over as "the windmill which runs when all others stand still." This new Aermotor with gears and bearings flooded with oil runs in much less wind than the old Aermotor.

The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The Auto-oiled Aermotor, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable.

Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof. There is no friction on any part of the furling device when the mill is running and very little when he wheel is furled. A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service. A band brake, of the automobile type, is used, and it always holds.

If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. The Auto-oiled Aermotor makes all this possible as it can run from one year's end to another with practically no wear and no cost. Water costs nothing. Use it. To let it stand is to abuse it.

If interested, write **Aermotor Co.,** 1146 So. Campbell Avenue, Chicago. Write right now.

ADVICE ON CATTLE FEEDING

I have a bunch of cattle weighing 1350 pounds. We have no market now I can sell and make anything. They are getting coarser all the time. I am feeding shock corn in the evening, shucked corn in the morning, with 5 lbs. of cotton rolled cake, some hay and straw. What will be the best way to feed from now on. They are in good flesh now. C. M. Sellers.

Answer by Professor H. O. Allison, cattle department Missouri Experiment Station.

It is difficult to change the tendency of a bunch of cattle which are growing coarse to that of merely laying on fat and at the same time continue to make economical gains. Such a change may be brought about by inducing an increased consumption of grain and a corresponding reduction in the roughage. To do this might involve shelling or grinding the corn. In case you can and decide to make such a change in the form of the corn fed, the change should be made gradually. If these cattle are taking their corn readily I doubt the advisability of increasing the expense by grinding. The feeds you are using should give good results and I would not advise your changing the quantity of cottonseed cake unless the price is such that it is cheaper pound for pound than corn. In such case it might be gradually increased to seven pounds per head daily. Where cottonseed cake is used in this quantity, however, there is some risk of the cattle not feeding well for longer than 90 days.

Sweet Clover Failed

To The Missouri Farmer:

In reply to your request in your issue of December 15, for experiences with sweet clover, will say that I tried it last summer and found it very unsatisfactory, having sown it under various conditions. What I sowed with wheat was a complete failure and what I sowed without any nurse crop on ground that was heavily manured was a complete failure also. This same ground that was heavily manured was sown to alfalfa in the fall and was a fine success. Also sowed an old fence row that was cleared up last winter without breaking and it make a fine growth on the hard ground.

I believe that as a pasture plant on hard soil it is a fine crop and I intend to sow some for pasture on hard soil, but as a hay crop on cultivated soil, it in no way compares with alfalfa.

Conclusions that I have arrived at in regard to boosting sweet clover, are simply that it is done by farmers that raise the seed to sell at a big price; and that it is not a safe crop for a farmer to spend too much money or time with until he thoroughly understands it by actual experiments. All the articles that I have read on the great value of sweet clover have been by farmers that have the seed to sell at a big price.

PRACTICAL FARM PAPERS—NO. 6

A Missouri friend writes to ask me if I do not find that it injures horses feet to stand on manure in box stalls that are only cleaned three or four times a year.

I can only answer from experience with two horses, which owing to breachy habits were kept in such stalls all the time.

The first of these horses, Barney, a gray horse of 1250 pounds, from 1873 to 1896; the second, Nig, a Morgan, black, 1125 pounds, from 1892 to 1913, and all smiths who shod these horses said that they had almost perfect feet. I think that Nig could carry a shoe longer than any other horse I ever saw..

The keeping of horses in box stalls involves the use of a great deal of bedding, and contrary to the ideas of those who have never seen it practiced, there is much less stable smell in such stables, than in those cleaned daily.

The droppings are packed solid so they cannot ferment, and the urine is at once absorbed by the litter in the stalls.

Governor Colman once told me, that the best arranged stable he had ever seen, was near Chicago, all box stalls cleaned at the owner's convenience, a small grain feed box in one corner, the rough forage fed right on the litter.

As to such stalls forming breeding places for flies during summer, P. E. Crabtree, once well known to Missouri farmers as an institute lecturer, claimed that they did not breed as many flies as ordinary tie stalls, and suggested that if the fowls of the farm were allowed access to the stalls for an hour each day, there would be very few flies found there.

I wonder how many farmers who read this will have as many potatoes as they will use this spring.

I have found by years of experience, that there are two ways to raise lots of potatoes for home use, one of these being to plant very early, the other to plant very late.

It is all very well to say that we will not be in too much hurry, and that we will wait until the ground works nice and loose, but we are liable to have as wet ground in early April as in middle March, so our early planting is put off until too late.

If there is a better early variety than early Ohio, I have not been able to find it, and if there is a better time for planting than March 15-25, I have not found it either.

In planting, early or late, we furrow rather deep, often going twice in the same place, and in early planting we cover deep, three or four inches, as protection against cold.

When we see the first plants breaking through, we take the harrow and go over the patch which makes later cultivation quite easy, with any regular horse implement.

We have been very successful in growing late potatoes, Sir Walter, Snowflake and White Star, planting about June 20, but this year broke the record by planting July 17.

It had been burning dry, and on July 16 a good shower came, the first since the first days of June.

Our seed potatoes had all rotted but about enough to plant ten rows, each sixty feet long, and in late October I dug from these ten rows nineteen bushels of large potatoes, or at the rate of more than 450 bushels per acre.

Of course I am not going to recommend planting that late every year, but as the potatoes are the best quality of any Sir Walter I ever grew, I think the late planting had something to do with this, and will plant this variety ten days later than I used to, or about July 1.

Where potatoes have a tendency to scab, it is well to soak the seed in a mixture made by adding formalin to water at the rate of a pint of formalin to fifty gallons of water. In a small way, an ounce of formalin to three gallons of water will give you about the proper strength, and the seed, after being prepared for planting soaked about four hours.

We have no rule as to how many eyes must be left on each piece of seed, but we have noticed that when seed was scarce and high, consequently cut pretty close we usually grow the largest yields, so I favor cutting to two or three eyes to the piece of seed.

Level cultivation is practiced, the patch being gone over with a hoe two or three times during the growing season, not to hoe potatoes but to cut out weeds missed by the cultivator. I have been keeping house thirty-five years and in all that time have failed but twice, in having plenty of potatoes for home use.

C. D. Lyon.

INOCULATE LEGUMES WITH NITROGEN-GATHERING BACTERIA.

Importance of Inoculating the Seed. In the Year book of the Department of Agriculture 1912, page 139, the Secretary of Agriculture states that: "Satisfactory methods for isolating and distributing nitrogen-fixing bacteria for improving leguminous crops by inoculating the seed or the soil were discovered. Tests in co-operation with thousands of farmers throughout the United States have shown that such crops as clover, alfalfa, vetch, peas and beans are often doubled and trebled in value by pure culture inoculation. During the past five years the efficiency of the cultures distributed to farmers has been approximately 75 per cent."

This is a most interesting as well as acceptable message to the agricultural world. It answers the questions asked years ago as to why certain legumes could not be grown successfully on certain soils or in certain localities. The trouble was not with the soil nor the legume itself. It was because the plants to be grown were dependent on certain forms of microscopic life or bacteria for health and growth, which were not found in the new environment. Therefore they could not succeed until the help came from some source. These bacteria draw from the air the free nitrogen and have it fixed in the soil of any field in which the legumes grow. Unless the bacteria are present the legumes will not develop very well, and sometimes fail utterly, but when they are present the host plants or legumes will grow vigorously and make large and sometimes phenomenal yields.

It was the year 1888 when the German investigator Hellriegel found by careful investigation that these bacteria locate themselves upon the roots of clovers, beans, peas, lupines and other legumes, forming a small tubercle there in which the nitrogen of the air is stored. The bacteria draw nourishment from the host plants, but in turn give to the plants nitrogen which is stored in these little tubercles. It seems that we have a fine illustration here of co-operation,—the plants helping the bacteria and the bacteria helping the higher plants to make a living. The plants need the nitrogen in order to maintain a perfect state of health, while the little bacteria need a home and carbon dioxide given to them by the plants on which they live.

But we have been calling one class of these beings bacteria and the other plants. They both are plants—the bacteria are one-celled plants and the host plants the higher form of plants —flowering plants. Just why all forms of plants are not able to use these little bacteria in the manufacture of nitrogen from the air no one can tell, but so far as we know at the present time, only leguminous plants are able to do this.

Bacteria in Soil. The soil is filled with all kinds of bacteria, some growing in one locality while others are growing in other soils. It is very easy to transfer these little useful organisms from one place to another, provided we plant host plants on which they can grow.. If we moved nitrogen-gathering bacteria from one locality to another, and did not plant legumes for them to develop on, they would soon starve. On the other hand, if we should happen to plant legumes in a soil that had no nitrogen-gathering bacteria, they would soon show very poor growth or develop suitable bacteria to aid in their life processes. In other words, the soil is filled with millions of bacteria suitable to the work in the locality where they are found naturally and if we change the face of nature we must provide some way to meet the new set of conditions.

Some Legumes Have Special Forms of Bacteria. Different species of legumes have special forms of bacteria. It has been found that certain clovers will not grow unless the seed are treated with water leached from the soil, in which the same kind of clovers have successfully grown before. Modern science has found that the seed can be inoculated successfully with the bacteria that have been especially prepared for that purpose, instead of leaching the soil as Hellriegel did. In order to supply these special bacteria for special legumes, we have only to find a legume on which they are successfully growing and carefully make cultures of these in the laboratory, and inoculate the seed of the same kind of legumes that are to be planted. In this way the bacteria can be transferred and transmitted from generation to generation. But it is rather strange that the same species of bacteria choose only one kind of legume on which to grow. There are a few exceptions to this, but very few.

Commercial Bacteria.. There are firms now manufacturing and selling bacteria for inoculating the soil. This is the natural consequence of Hellriegel's discovery. If the bacteria will help to increase the productivity of the soil, man should find some means of making use of the bacteria. He has found such means, and learned to put up cultures that will keep several months and then inoculate the soil and the seed with good effects. These cultures are sold under the various patented names of Nitragin, etc., etc., but all are made practically in the same way. They all come from the soil, and the host plants, and will succeed if restored to their native environment.

Effects of Using Bacteria in Planting Legumes. Hellriegel himself found that the vines of lupine untreated grew only about six inches in height, while the treated vines grew 24 to 30 inches. The first paragraph of this paper quotes from the Secretary of Agriculture that legumes are often doubled and trebled in yields by being treated. Wherever experiments have been made with fresh material, the results have been most satisfactory. Most of the Experiment Stations have tried inoculations with one or more legumes, and with the very best results.

Do All Soils Need Inoculation? This may be or may not be true. The inoculation is of such great importance that one cannot afford to run any risk. The soil is helped and the plants do better if inoculated even in soils that do not specially need the bacteria. Sometimes the introduction of bacteria by means of transferring soil from one area to another removes the necessity for inoculation, but such cases are very seldom, and cannot be relied on. It would be best to always inoculate legumes with the proper bacteria wherever they are being grown for the first time, or have been grown in a place without success. Usually they are not costly, and more than pay for themselves a hundred times, in course of a few years.

Methods of Inoculation. It is not necessary to give details of applying the bacteria to the seeds here. It will be well, however, to suggest that these useful organisms may be bought in convenient form well packed for keeping an indefinite length of time. In such cases directions for using same always accompany the package. Where a farmer has been growing a certain legume with great success, he will be able to transfer some of the soil from this field to some other place on the farm where he wishes to grow the same legume. This is a rather dangerous practice for the reason that weed and grass seed are often distributed in this way much to the sorrow of the farmer. The pure cultures are always best, if they are virile.

Time of Inoculation.. The seed should always be inoculated just as they are to be planted. This is an invariable rule, because the bacteria will enter the roots of the young plants just as they are getting a hold on the earth better than any other time. Some have asked if it would be possible to apply the bacteria after the young plants are already up. This may prove effective, but should not be done, unless in case of emergency, where the bacteria reached the planter too late to be used during planting. Methods for using the bacteria always accompany the packages in which they are shpiped.

Legumes the Hope of the Farmer. It is well known that the very best green manure that can be grown is leguminous crops, and unless these are a success, the crop amounts to but little as green manure. The crop should be heavy in order to do a great deal of good as a manure, and every possible means should be used to secure the heavy crop. The safest way is to inoculate the soil with the proper bacterium, and at the same time fertilize the crop with a high-grade 10-4 Acid and Potash fertilizer. The bacteria will take care of the nitrogen problem. The legumes are also the best food for animals as well as man. What we need is more legumes. A community is prosperous almost in proportion to the number of farms successfully growing leguminous crops.

R. J. H. DeLoach,
Director Georgia Experiment Station.

ENSILAGE THE CHEAPEST FEED

I notice in your issue of January 15 that you want testimonial letters regarding experience in feeding ensilage. We have been feeding it in Missouri for several years and consider it the very cheapest feed we have ever had for both roughing and fattening cattle, when it is mixed with cottonseed meal. When we want to fatten cattle we usually feed them the ensilage mixed with four or five pounds of cottonseed meal per head per day for 1000 pounds live weight cattle until the last thirty days of the feed when we add a liberal amount of corn to the ration and of course let up on the ensilage in proportion.

This year we have tried a new stunt, that is, using blackstrap molasses by simply pouring it over the ensilage and cottonseed meal. We dilute the molasses with about one and one-half parts water. This makes a very cheap molasses feed and so far we have been very well pleased with it this winter. We buy this molasses in Kansas City by the barrel. Of course the molasses is so thick we are obliged to heat it a little and then sprinkle it over the ensilage either in the trough or the wagon, but we know it makes the cheapest molasses feed we have ever fed and also one of the best.

We have used wooden silos in Missouri but have steel ones in Oklahoma. Both of them are quite satisfactory and it is our opinion that almost any kind of a silo properly erected will do the work and we do not see how we could possibly get along without our silos.

J. P. Maurer.
Nodaway County.

SUCCESS WITH THE HOT BED

I have had many years experience in growing sweet potato plants in this section which is about 100 miles south of Kansas City. About first week in April, owning to season, say about time apple trees begin to bloom is the best time to bed sweet potatoes.

On the north side of place where the bed is wanted put up a board two feet high and as long as the bed is wanted. Then on the south side about five and a half feet from the first board put up another one foot wide and then put up the ends. Dig out the soil from this box to a depth of 18 inches and bank this loose soil up around the boards. Horse manure with about one-half bedding is the best to fill in with. Put in about 20 inches deep of the manure wet enough to make it heat and then cover with about 10 inches of good soil. It is better if the soil is mixed with rotted manure or sand and better still is leaf mold from the woods. I do not tramp the manure because it heats too quick and does not last long enough. Place the potatoes about one inch apart and cover well with the soil. Sash with glass is better for cover than muslin and a 3x6 feet sash can be bought for $2.10 to $2.50 each. Take off sash on sunny days but put back on at night or when there is danger of frost.

The best time to water the bed is at evening and the bed should be watered before plants are pulled. Last year from a bed of five bushels I pulled from 1000 to 3000 plants a day for about six weeks. I sold the first plants at 35 cents a hundred and the last ones for only 10 cents. The best varieties for me are Yellow Jersey, Southern Queen and Red Bermuda.

Will answer questions if stamp is enclosed.

Jacob Faith,
Eldorado Springs, Mo.

THE PROBLEM OF RAISING CHICKS

[This article by H. L. Kempster, poultry department, State University, will save Missouri poultry raisers a million dollars this year if the suggestions are followed]

No problem is of greater importance to the poultryman than that of renewing his flock. The same problem presents itself to the farmer in the same degree. Each spring he is confronted with the task of raising a new flock to replace those that are to find their way to the table or are sent to the market. How to more successfully raise the chicks is the problem and the following is written with the hopes that the reader will gain a few suggestions that will make this season's work more efficient.

The breeding stock should be under observation at the present time. Livability in chicks is an inherited characteristic and it depends more upon the mother than the male. The farmer should not breed from the entire flock but should select out a few of the best birds for breeders and mate to them the most vigorous male that it is possible for him to obtain. The criticism to be made of the farmers' method of breeding is the use of inferior males, breeding from the whole flock, the selection of eggs for hatching from the general egg basket and the use of males that are generally own brothers to a greater portion of the flock. One cannot expect vigorous chicks by such methods. Brother and sister mating will result in poor progeny and there is no question but that this practice has caused the death of large numbers of chicks. The breeding stock should also be mature—fully developed. For this reason hens are generally considered better for breeding than pullets. They also lay larger eggs and there is no question but that the larger eggs produce the larger chick. Other points that should be taken into consideration in the selection of eggs are that they be fresh, well shaped, free from uneven surfaces, should have firm shells and should not be misshaped. The time of hatching is also important. The natural breeding season is the easiest time to raise chicks. About March 1 the fertility and hatchability is the greatest and the farmer should aim to hatch his chicks as early as possible. There are two reasons for this. The first is that it gives the chicks a fair start before the hot weather comes. The second, it gives the chicks time to fully develop before winter sets in . The reason pullets don't lay in the winter is quite often due to the fact that they haven't had time to fully mature. If the farmer expects to get eggs next winter from birds hatched this spring he should plan to have them hatched **not later than May 15.**

Need Better Equipment

Another problem that is quite often serious, especially is this true during bad weather is that the farmer is generally equipped to raise about one-quarter the chicks he (or she) attempts to raise. The fact that many people have insufficient equipment always results in enormous losses. It is poor economy to over-load the facilities. Not only is this true of houses, etc., but it is also true of the land used for brooding. One should always bear this in mind—purity must be maintained. If not by space it must be by care. The smaller the area set aside for the chicks the greater the amount of care necessary to keep them healthy. More chicks die from this cause than any other. The city-lot poultry keeper is the one most liable to violate this principle but the farmer is generally guilty of the same crime. Every year punishment in the way of heavy losses is meted out and yet the following year the same offense is committed. Great losses occur because the **back yard is unhealthy and is not the best place to raise chicks.** There exists the accumulation of decades of fifth and yet this year you are planning to use the same yard again.

For hen hatching a combination hatching and brood coop has been used at the college with success. This coop is three feet wide and six feet long. It is three feet high in front and two feet high in the rear. The back side has a door eight inches wide, the entire length so as to afford easy access to the hens. The front consists of four small doors through which the chicks may run. Above this running the entire length is a door a foot wide that can be raised for ventilation and light. This coop can be divided into four compartments for hatching purposes. The partitions may be made of burlap frames. The idea is to set four hens at the same time, one in each compartment and when hatching takes place to give the chicks from two hens to one for brooding. Later the middle partition can be taken out and roosts installed. If the cockerels are separated from the pullets the house will house the pullets until time for them to be transferred to the winter quarters. This has an advantage over the usual brood coop in that it can be used for hatching, for brooding and for housing. The ordinary brood coop is of little use except for brooding. Usually the farmer uses it the rest of the season with the result that the chicks take to the trees, etc., because of the crowded conditions. Ordinarily the coop can be placed on a knoll where it will not be effected by surface water. If, however, the place is annoyed by rats it can be made rat proof by using a board floor. The board floor will also make it much better for brooding purposes because it can be kept dry.

Keep Down the Lice

In setting a hen one should take provisions for the prevention of lice—the greatest objection to hen hatched chicks. The hen should be dusted with insect powder at the time she is put on the nest and the again ten days later. She should be examined again just before hatching and treated again for lice if necessary.

The nest should be at least fifteen inches square and should be made on the ground or with dirt or an overturned sod to supply moisture. The dirt should be covered with three or four inches of fine, clean hay or straw well hollowed to better contain the eggs, only as many as the hen can cover comfortably. During the hatching period feed should be kept where she can get it easily and a place should be provided to satisfy her desire to wallow.

Little chicks require fresh air, and should be kept dry and clean. A vital consideration is to keep their backs warm. An artificial brooder should be economical, convenient, should have a cool floor (i. e., the heat should come from above), a good system of ventilation and should be suitable for all kinds of weather. Their quarters and feed should be absolutely clean and provisions must be made for the chicks to run on dirt. Leg weakness is quite often due to failure to supply this last requirement. Chicks with hen should be confined to the coop until the grass becomes dry as wet chicks become chilled and chilling causes diarrhea.

During the first two days of a chick's life it should rest and be kept warm. It is better without food until it is forty-eight hours old. The absorbed yolk furnishes part of the chick's food for the first ten days. The first food should be some fine white grit. This stimulates the digestive apparatus and prepares it for food to come later. When the chicks are fifty hours old, give them a small amount of commercial chick food or the following mixture: Three parts finely cracked wheat, three parts finely cracked corn, one part steel cut oats. Keep this in a fine clean dry litter all the time so that the chicks will be encouraged to exercise. In addition to this sprinkle a handful of rolled oats in the litter. This is attractive, the chicks eat it readily and it is almost a perfect food. It is poor economy not to feed rolled oats to baby chicks.

Give Clean, Fresh Water

Chicks should have access to clean, fresh water in a fountain which should be so constructed that they cannot get themselves wet, and which can also be easily cleaned. It is also desirable to give them access to sour skim milk or buttermilk. In feeding milk best results are obtained if fed sour. The lactic acid acts as a germicide. Then, too, there is no danger but that the milk will always be sour.

Under farm conditions the following mixture may also be fed after a few days as a substitute for the rolled oats. Three parts bread crumbs, three parts corn bread, one part boiled egg. This mixture may be fed dry or moistened with sour milk. A very small amount of fine charcoal may also be fed. Feed the chick food and the rolled oats for the first ten days. Then substitute for the rolled oats this mixture: bran three parts, corn meal three parts, middlings three parts and one part of finely sifted beef scrap. If milk is fed this beef scrap may be ommitted, since the protein requirement is supplied by the milk. A handful of bonemeal should be added to every twelve quarts of this mixture. This is insurance against leg weakness which is caused by failure to supply bone-making material in the food. The cracked grain part of the ration can be gradually changed to the coarser feed. Keep fine grit before them. About the second week from hatching start feeding green foods such as onions, lettuce, beets, sprouted oats, clover or alfalfa. The green food should be made fine enough for the chicks to eat: cut it in a meat chopper or with a knife. When feeding sprouted oats do not include the roots as these and any other kind of dry material are likely to compact the crop of the chick. The ground food part of the ration may be fed in a trough covered with a half-inch wire screen to prevent wasting. This may be kept before the chicks all the time. One should be very careful in regard to the corn meal which is fed. It should be absolutely free from moulds.

Give Plenty of Range

It may be advisable to feed a wet mash once a day. This may comprise the same ingredients as the dry feed mash mentioned above. In feeding a wet mash it is not advisable to feed it until the chicks are five weeks old. It should be fed about four in the afternoon and only the amount that the chicks will clean up before going to roost. Wet mash sours very quickly and a sour mash will cause diarrhea. As soon as possible feed the ground feed in a hopper where the chicks may have access to it all the time. When they are eight weeks old arrangements should be made to remove them to some place such as the edge of a corn field, orchard, etc., where the ground is pure, the bugs and worms plentiful; where there is an abundance of shade and the birds may be grown economically and better than in the back door yard, and where the problem of raising them is so simplified as to reduce itself to keeping a supply of feed and water before them and to cleaning their house once a week. Also the droppings will be utilized and will add fertility to the soil. A crop of chickens and a crop of corn can be grown on the same ground and the farmer will be accomplishing the feat of making two crops grow where one grew before.

Cleanliness, Regularity, Good Judgment

Successful brooding requires close attention to detail. One should know at all times just where the chicks are and in what condition. Failure to shut them up at night may result in losses from rats or cats. Approaches to the coop should have no corners into which the chicks may crowd. Houses should be move from place to place gradually or the chicks will go to the place where they were housed the night before. However if the house is moved with the chicks in it far enough so that they forget their old surrounding they can be let out and then will return to their house at night. Above all the poultry man must remember that perfect cleanliness, regularity and good judgment are essential in all the varied operations of the business.

"It seems to me that every farmer in Missouri should be willing to pay 33⅓ cents a year for a paper like The Missouri Farmer." This is the sentiment which is expressed in hundreds of letters which reach us from all over the state. Don't you think so too?

148 Chicks From 150 Eggs

Osceola, Mo.

I surely praise the Sure Hatch incubators. I have a 150 egg size. The first setting I put in 152 eggs and broke two the first week which left only 150 at hatching time. I got 148 chicks and never tested the eggs. We surely have had fine luck with our machine the past two years. Would not sell it and be without it for any money. My neighbors have other incubators and I beat them all. NELLIE GARDNER

Frank Hammond
President

Women and children find it easy to succeed with the Sure Hatch Incubator

We can give you the names of tens of thousands who make a handsome, steady income with very little effort, and would not bother with hens or with any other incubator. The

Sure Hatch

Is Automatic in Operation

Our **Uncle Sam Poultry Book** will help you to succeed. It tells all about how to handle the business the best way. It is a compilation of official reports by U. S. Government experts. Tells what to do and what not to do. Many illustrations. Free with every **Sure Hatch.**

Any one can succeed with it, even if they have never seen an incubator before. It is a plain, simple, strong machine, so built that it can't go wrong. Will hatch in cold weather when others fail. We send with each machine complete instructions for operating that are very easily followed.

We guarantee it 10 years and send it to you freight paid, on 60 days trial. Satisfy yourself by actual test that it is a quality machine in every respect. Your money back promptly if it is not all we claim for it.

Poultry turns kitchen waste and other farm waste into ready money; and you can depend upon the Sure Hatch to bring you the chicks at the time of year you want to hatch them to get the best price for them.

Write for our Free Illustrated Catalog, giving full information on Sure Hatch Incubators and Brooders, with much valuable information about poultry.

FOR WINTER EGGS

The surest test of a hen's efficiency is her ability to lay winter eggs. The winter egg period embraces the months of December, January and February. Sometimes a hen that may have the winter laying characteristic does not lay enough eggs during these months to indicate that she can be classed as a winter producer even in her pullet year. One factor that controls winter egg production is the season that a bird is hatched. The early hatched stock will often be brought to maturity in the early part of the fall and moult during the months of December and January, so it is easily seen that the time of hatching has a big influence on egg production. Many of our birds this year have loafed on the job during the last month on account of moult. This has prevented them from giving as good account of themselves as they might have done. Many more were immature and lost time for this reason.

There is no question that is asked more times by the prospective keeper of poultry than "What breed shall I carry?" The answer we generally give him is that it depends whether he wants fowls for back yard or the farm,

A pleasure to market them

or wishes to go into the specialty business to produce eggs for the market. The next thing our inquirer wants to know is, "Which breed has the best layers?" We tell him that depends upon what the fowl has inherited, as good laying is not confined to any one breed. It is a scientific fact that you cannot develop that which an animal or fowl does not inherit. You cannot give enough feed to a hen that has not inherited the egg-laying characteristic to make her produce eggs. For example, there is one hen that has been in the National Contest for two years that has never produced an egg.

Some hens lay during the winter months, some do not. Some will put fat on their bodies, other put their feed into eggs. There is one pen at the Missouri Station selected on account of poor laying points, thick pelvic bones and narrow behind. These hens are given the same feed that a check pen is fed which is selected for layers, thin pelvic bones and lots of capacity. The hens of poor laying make-up are putting their feed into fat, the latter are using the feed to produce eggs. The ones selected for egg production from external appearances alone are far in advance of those selected in the same way as non-layers.

The dairy man gives an essential point of a good producing dairy cow that she must have a large capacity to consume a great amount of feed. It is natural to give this as an essential point of a good hen. She must have capacity to use her feed by converting it into eggs.

The records for the past year indicate that some hens have tendency to consume a great amount of feed but little capacity to convert it into eggs. Those hens which do not have this capacity in these days of high prices are a big drain upon the revenues of the keeper and it must inevitably turn the attention of every breeder of the country to the importance of breeding hens that have a feed-converting power.

The Wyandottes are giving further evidence this month that they have the winter laying capacity, and have led the contest on pen record. In fact, the dual purpose breeds have the lead over the Mediterranean breeds for the month of January.

In the southern country there are no better months in the year to hatch incubator chicks than the months of February and March. They can be matured in time to catch the early egg market and the males can be culled for the broiler market. It is more difficult to start the work in the northern portion of the United States at such an early date, but even if hatched later, the advantages in climate help to counterbalance the earliness of the early southern hatched chickens.

The big price of grain need not deter you from making big preparations to rear a good flock of layers for the next winter's work.

KEEPING EGGS FOR HATCHING

There are several foolish beliefs and superstitions about keeping eggs for hatching. Some of them are pointed out and explained away by F. C. Hare, poultry husbandman of Clemson College, who further advises the correct methods of keeping eggs over a period of several days before putting them under the hen or in the incubator.

The yolk of an egg, said Mr. Hare in giving some of the basic laws of poultry reproduction, grows from a small point to full size in a sack attached to the ovary of the hen. When the yolk is ripe or at normal size, the sack is ruptured and the yolk enters the oviduct, a tube about 18 or 20 inches long that secretes the albumen and two membranes (skin) inside the shell. Just after the yolk enters the oviduct, the germ (a small round spot with lighter center that can be seen on the yolk) is fertilized if the hen has been with a male.

When an egg is laid and has become cool, the growth of the germ or embryo almost ceases. The little chick remains in a dormant state until the egg is heated to a temperature of 80 degrees or more. Then the process of hatching continues and if the heat is maintained according to nature's laws, the chick will emerge from its house of shell at the end of about 20 days.

It is necessary to keep eggs that are being held for hatching in a cool room, at from 50 to 60 degrees, if best results are desired. Heating and cooling eggs alternately, or turning them daily, or placing them in the sunlight mitigates against a successful hatch.

The common belief that turning eggs improves their hatching is not borne out by results. Turning does no good and it frequently does harm by displacing the contents of the egg. A warm temperature reduces the density of the albumen and many chicks will die from becoming attached to the shell membrane. Keep the eggs in a basket covered by a cotton cloth, in a cool, dry room, advises Prof. Hare. In this way they will keep about 10 days, and hatch well, but it is evident that eggs will hatch better if incubation begins within two or three days after laying.

An experiment conducted by Mr. Hare at the United States Experimental Farm near Washington in the spring of 1913 showed that 70 per cent. of the weight of the egg when incubation began was the weight of the dry chick hatched from the egg. This illustrates the importance of always setting large eggs. Do not hatch a chick from a smalll egg, because only a small chick can result. The big chicks grow faster and usually make better layers and breeders. Besides, one will increase the average size of eggs laid by one's flock by always hatching chicks from big eggs.

The Danes, said Mr. Hare, have practiced this system for years and their standard weight for eggs is the heaviest in the world, being thirty ounces per dozen—two and a half ounces per egg. The American standard weight is twenty-four ounces per dozen.

HOME-MAKERS

This Department Edited by Miss Alice Kinney

We are pleased to note that our Poultry Contest is meeting with responses from interested women; it is yet time to enter for this is the season of the greatest activity among poultry raisers.

The following entry to the Contest is a source of great gratification, and we trust that this little leader in the Junior Poultry Department will stimulate many others to follow her efforts and enter the contest; you will be interested to learn that this little maid has to buy all her feed and keep her chickens in a run, because her home is in a town and her nearby neighbors would object to having her biddies visit their flower beds and garden. You who live where your chickens have a whole farm to run over and find their feed cannot understand how she is going to make any money, it will be of interest to watch her progress and perhaps she will tell us from time to time how she is getting along, so that we shall not have to wait a whole year to hear of her success.

"I am eleven years of age and very fond of chickens, so last year I decided I would try my hand at raising poultry.

"I purchased three sittings of Single Comb Rhode Island Red eggs; from this number I hatched thirty little baby chicks and raised twenty-four of the number.

"When they were ready for the table I sold eleven for $4.55 leaving thirten pullets for my start this year.

"These were hatched March 17, 1914, and began laying Dec. 5th. I have sold eleven dozen eggs at thirty cents per dozen.

"From now on I want to save my eggs to sit, so began my bank account this week with $7.85.

"This past year my father paid for my feed in order to give me a start, but now I am to bank all my money and pay my own poultry expenses by checks.

"In this way my parents hope that I will get a business education at the same time I am learning to raise poultry."

Mary Dey Faires,
New Franklin, Mo.

At our request the Editor is sending out a few complimentary issues of The Missouri Farmer, and we shall greatly appreciate a responsive card from each one who receives same, telling of their interest and approval of these pages, also what special feature you would like included; it will be most helpful to the department in their efforts to make it of value to every home-maker in the state.

The following are a few of the resolutions passed at the last Home Makers' Conference for which our women nobly stand:

Resolve that we, the members of the Missouri Home Makers' Conference, do all in our power to promote the cause of temperance, to secure the final prohibition of the legalized liquor traffic.

Resolve that we use our influence to promote sane and sensible dressing for women.

Resolve that we appeal to the State Board of Agriculture to make some effort to prevent the waste of canned fruits and vegetables exhibited at the State Fair, especially that which is desired for other exhibits.

Today, as we watered and admired our indoor small boxes of little tomato plants, our thoughts went out to the many hundred of women who were probably doing the same interesting work of caring for their future garden, first by keeping the boxes warm enough in some corner, until the seeds have sprouted, then hunting the brightest window where they can find the most sunshine; a little later, when they have four strong leaves, they will be transplanted to four-inch pots or old berry boxes and placed in a cold frame where they will continue to grow and make sturdy plants for the open garden when the weather is warm enough; frequently they will have blooms and fruit on them which they will retain if transplanted with care; to the aveage Home Maker; the cold frames seems the easier method if the plants have been started indoors; it makes the transplanting to larger spaces and much lighter task in any weather, unless the amount of seed planted is considerable then it would not be practicable; these early started plants well repay you for all the extra care and time by giving a much quicker return for either your own garden of for the early market at a time when it means a good profit; if you have not already started your seed come and join us at once.

In the next issue there will be given some directions regarding the making of cold frames.

TO THE MISSOURI FARM WIFE

It's rain or snow—
An' I don't know—
Just which to say it is,
It sticks to trees
In glassy freeze,
An' hurts my rheumatiz'.

The clouds are gray
An' not a ray
Of sunshine filters through;
So cold and wet
I like to set
Close by the fire with you.

For here inside
Where you preside,
It's not so dull and gray;
You've shorly stored
A good sized horde
Of sushine for today.

For it shines through
Our home from you,
And brigthens round about,
'Til we forget
The cold and wet—
But how's the "down and out?"

—Carrie Polk Johnston.

BUCKSHOT BY THE PROFESSOR

There are a pile of fellows who think they know how to run the government who ought to be running a manure spreader.

Every time I demonstrate that I can climb into and out of an upper Pullman car berth, the more faith I have in Darwin's monkey proposition.

Were you ever a boy and did you ever come mighty near losing your religion trying to pull on an old frozen pair of boots along about five o'clock on a cold winter morning?

The local barber had a fuss with old Josh Simpson the other day. Old Josh gets his hair cut once every year—and the barber tried to make him put up the price of a new pair of scizzors in advance.

From what I can learn in the newspapers it strikes me that we must have one of the best Legislatues we have had in years. They say it has fooled around so long that it won't have a chance to pass hardly any new bills at all.

There are a lot of politicians who are just naturally ignorant and then there are a lot of others who wouldn't tell the truth if they knew it. The demagogue is one of the things that's the matter with American business.

DEATH RATE IS TOO HIGH

"There is no law of mortality. The health and death rate of every community depends entirely upon sanitary conditions in that community. When a community has an excess of typhoid fever, or any other contagious disease, it is because the people are too niggardly to take measures of prevention."

This statement was made by Dr. M. P. Ravenel, professor of preventive medicine at the University of Missouri, at the opening convocation of the second semester at Columbia.

Doctor Ravenel said that there were 1,000,000 deaths in the United States every year, 400,000 of them being due to health negligence.

"Every day," he declared, "there are

(Continued on page 18)

KODAK on the Farm.

AT every turn, country life offers opportunity for the camera. In a business way there are records of stock and crops and buildings and trees and ditching to be kept. From the standpoint of the family album there are pictures of the children and the pets and the home—pictures that grow in interest with every passing year.

And the Kodak adds fun to every wholesome frolic. At the picnic, at every evening gathering, on the trip to the city, on the shooting and fishing trips it adds to the pleasure at the time and the resulting pictures are a pleasure for all time.

And the cost is less than you think.

International Harvester Cream Separators

PICTURE to yourself the difference in the amount of actual work done, between setting milk in any of the old-time ways and skimming it with an I H C cream separator. What a job it is to wash the pans or crocks. How many handlings they need. What a lot of time it takes to fill them and set them away, to protect them from dirt, to do the actual skimming, to dispose of the cold skim milk, to purify the crocks or pans.

Now note the difference. With an I H C separator the milk is skimmed while still warm from the cows, the separator is washed in a few minutes and everything is ready for the next milking.

You want the separator that will help you most. There are other things than the saving of work to be considered. There is saving of cream, value of the machine, service in case of accident, and many other things to be thought of before you buy a separator.

Take time enough to buy a cream separator. The more carefully you go about it, the more comparisons you make, the more clearly you will see that one of the International Harvester separators—a Dairymaid, Primrose, or Lily, will serve you best. See the I H C dealer. Get catalogues from him or write to us for them.

Barred Rock Cockerels, excellent quality, $1, $1.50. Eggs for setting, Bradley strain, $1.50 per 15. Farm flock, bred-to-lay strain, $1 for 15. Mrs. Marshall Gordon, Rt 1, Columbia, Mo. 311

The Missouri Farmers' Exchange

We now have listed a fine lot of cowpeas, soybeans, seed oats, seed corn, clover, timothy and alfalfa. One of our members writes, "In a recent purchase of three bushels of alfalfa seed through our exchange I saved $9.25 and was pleased with the seed." Write us about your wants. Address, Missouri Farmers' Exchange, Columbia, Mo.

Single Comb White Orpington Eggs for hatching, from my famous English strain. Best pens $2 for 15 eggs; utility stock, $1.50 for 15 eggs. Fertility guaranteed. Order from this add. E. L. Andrews, Maryville, Mo. tf.

White Wyandottes—Winter layers. Eggs $1.50 per 15; $2.50 for 30. Richard Bloom, Fulton, Mo. 314

S. C. Rhode Island Reds. Bred for eggs. Prompt service at reasonable prices is our motto. If you want eggs from the best utility stock. Write Mrs. Geo. Gerhart, Glensted, Mo.

1100 people sacrificed in this country through carelessness."

The speaker said that the state boards of health were inadequately supported and that they were overloaded with work that belonged to other officers. He pointed to the results achieved during the construction of the Panama Canal as an example of what could be done in the United States. Doctor Ravenel stated that the death rate at the Panama Canal at present was lower than the death rate of any city in this country.

"Much of the insanity and crime in this country," he said, "is due to diseased bodies or minds. We spend millions of dollars for the care of these people, yet do nothing to get at the root of the thing."

Doctor Ravenel said that the death rate in the German army, due to typhoid fever was but one man in every 300,000. He said that this was due to the fact that vaccination there was compulsory. Because of the adoption of compulsory vaccination laws in the United States Army, there were but four cases among the 90,000 men in 1913-14.

FIGHTING FOR PURE MILK

So many dramatic disclosures have been made in regard to the relation between dirty milk and the excessive death rate among infants that farmers are beginning to realize as never before the necessity of co-operation with the municipal authorities in their fight for pure milk.

Milk is certainly the most important article of food in the human dietary, and it is also the most contaminable. It is, therefore, up to the farmer to see that the milk from his dairy gets to city babies in as reasonable a state of cleanliness as possible. Not that this is an enclusively baby problem, for all sorts of diseases are carried through milk. Tuberculosis is an example of this class, and a number of epidemics of diphtheria and scarlet fever have been traced to the milk supply, but when we pause to consider that one-fifth of all the babies born in the United States die in their infancy from preventable diseases, and that sixty per cent of these are due to gastro-intestinal diseases, due to improper feeding or impure milk, we naturally begin to look into the cause.

I realize, of course, that not every farmer can have his milking done scientifically; but it is possible for him to produce safe milk for his own use and that of the public by very simple and inexpensive means.

He may not have an elaborate dairy outfit, but his cattle can be kept clean and in perfect health with the assistance of a veterinary. It will be to his financial interest in the long run. Tar paper, whitewash and homemade cement will insure a sanitary stable at small cost.

Then, there should be a covered milking pail in place of the old-fashioned wide-mouthed pail. This will keep nine-tenths of the dirt out during milking time. All milk utensils may be kept clean by the use of a brush and a solution of soda followed by a final rinsing in scalding water. If ice is not possible for one farmer, is it not feasible for several farmers to combine their interest, and secure a supply of ice at some central place at a reasonable cost?

I hope the readers of this paper are not superior to germs. If you are, send for some of the Government literture on the subject of the care of milk. A request of the Bureau of Agriculture will bring a number of bulletins to your door, much to your enlightenment.—M. M. Carrick, M. D.

THE HEALTH CROP

In my work in connection with the Department of Agriculture, I often go out among the farmers and look at their farms. I recently visited twenty-five farmers' springs, where they get their water for their families. Every single one of them had chickens running around it, or pigs, or sheep, or cattle grazing right around the spring. And I have not examined a single one of the springs but what I found it containing bad germs from animals' bodies.

You go into the farmers' cellars—they are seldom fumigated and cleansed, and often full of rats and vermin. If we had a Department of Health, every school would have an instructor, every village would have a lecturer, and every town would have a commission to look after these things.

I am paticularly concerned with a farmer who has two sweet little children. Their moral training is excellent; they are kind and unselfish, and eager to be of service. They have never taken any care of their teeth at all. So, as I was interested in the children, I bought each of them a toothbrush and said, "Now, every time you eat you must clean your teeth afterward; and when you get up in the morning, clean your teeth; and when you go to bed, clean your teeth." I was playing with one of them the other day and I thought her teeth did not look very clean, and I said, "Do you use the toothbrush I gave you?" And she said, "No, I haven't used it yet; I'm saving it."

What interest could these children be expected to take in good teeth, so essential to good health, when they do not know anything about the subject? And yet their father is intensely interested in getting good crops and in good fetilizers, and in fine cattle and in registered pigs. He constantly asks questions about how to increase the yield of corn, or how to select the seed. But he has never asked as to what his children should eat, in order—when they are mature—that they may have the greatest crop of health, mentally and physically. This farmer has not the least notion of what the first principle of good health is—in the way of ventilating his house, or having the children sleep in the fresh air, or selecting the most healthful food or the least injurious occupation for his children. Harvey W. Wiley, M. D.

SCREEN THE SMOKEHOUSE

The skippers commonly found in cheese and meats are the young of small flies. They sometimes become an intolerable nuisance in smokehouses, attacking ham, bacon and the like during the process of smoking or before they can be cased. Where a house is once thoroughly infested, the flies are found in swarms everywhere ready to attack the meats as soon as there is the least opportunity. Windows should be closely screened, the walls should be white-washed frequently so as to keep all crevices filled up; the floors should be kept clean and should be as solid and smooth as possible to prevent the development of maggots in crevices filled with greasy substances. The flies can be killed by fumigating with tobacco or pyrethrum. For this purpose the room should be closed tightly in the evening after the work is done or on a Sunday or other day when work ceases, and a sufficient quantity of either tobacco or pyrethrum should be burnt on live coals to fill all parts of the room. It should be left ightly closed for from eight to twenty-four hours. At the end of this time the flies will have been destroyed, but the maggots will not. It will be necessary to repeat this operation two or three times at intervals of a week, to destroy the flies as fast as they hatch, and before they have an opportunity to lay their eggs. In some cases bisulphide of carbon may be used to fumigate. This must be done when there is no fire on the premises and the house, which should be left closed twelve hours at least, should then be aired until no trace of the odor remains before fires are again introduced. Carbon bisulphide is as inflammable as gasoline and should be handled with equal care.

When the meat is already infested, the infested portions should be trimmed away and clean salt rubbed into the surface exposed by the trimming. To avoid making the meat too safety the extra salt should be rinsed off. The object of this treatment is to harden the surface which has been exposed by the trimming.—Bulletin Kansas Agriucltural College.

LIGHT, COOK, IRON, WITH GAS

Mrs. Housewife:

Sit down now and just drop us a little note asking that we send you FREE our profusely illustrated booklet telling all about "Gas" and how easily it can be installed in your home.

This booklet starts off by mentioning some of the inconveniences experienced in homes without gas. Then it tells the conveniences of having gas. How every room can be instantly and brightly lighted. How there is no trouble attached to it at all. How a gas range is used in the kitchen instead of a coal or wood range. How gas irons are used for ironing. And how gas contrivances of all kinds lessen labor and save time. After it has covered these subjects very interestingly and fully it says:

"And Why Don't You Mrs. Housewife Have Gas In Your Home"

You can now. There has been a machine invented and patented that enables you to make your own gas even cheaper than "City Folks" buy it. And the gas you make will do everything city gas will do. That machine is the

AERO-GAS MACHINE

Our booklet tells all about the Aero-Gas Machine. But this booklet says so much that we can't begin to outline it here. Why not send for it now. It won't cost you a penny and doesn't obligate you to anything.

Send for that FREE BOOKLET NOW. PLEASE. Address,

St. Louis Aero-Gas Machine Co.

517-519 North 2nd St., St. Louis, Mo.

MISINFORMATION

We very often hear some farmers say, "I am done with farm papers, for in the past few months I have read four or five articles, every one misleading and contrary to real farm practice.

A certain class of so called "farm papers," is responsible for this criticism, as such papers are published and edited by men who are absolutely ignorant in regard to what a real farm paper should contain, whose only object is a circulation that will draw advertising patronage, and whose contributors are frequently secured by the occasional offer of a few dollars for prize articles upon some phase of agriculture.

Before me is a paper of this class, containing a series of these prize articles on Poultry raising, and I call attention to some statements contained therein.

One writer, in calling attention to the merits of incubators as compared with natural methods of hatching chickens, says that it will take one pint of corn per day, each, or sixteen pints, for the sixteen hens necessary to cover the 200 eggs that could be placed in an incubator of that capacity.

In another article, the writer is calling attention to the profits to be made by caponizing all the young cockerels.

Now as most of the caponizing must be done by middle of July if good heavy capons are to be produced, and as the demand for capons begins in earnest about December 15, the grower will have approximately 150 days to feed his birds.

If it takes a pint of corn per day to feed a setting hen, it will certainly take as much to feed a rapidly growing capon, so each bird will have in 150 days, consumed 150 pints, or nearly 2⅓ bushels of corn worth at 75 cents per bushel very nearly $1.75.

Provided that the market is not too far distant, demand good and shipping cost not too great, a ten pound capon will bring 17½ cents per pound, just paying for the corn it ate.

As every poultry raiser knows, it does not take a pint of corn per day for a setting hen or for a capon either, yet a writer in a so called farm paper has made the statement, and the critical reader blames all real farm papers for it.

In another paper I find the astonishing statement, that one horse or cow, produces enough manure to keep up the fertility in six acres of land used for general farming. I wish it did, for with our fifteen head of stock I could manure ninety acres, instead of the eight or ten acres that we are able to cover per year and we think sometimes that we spread pretty thin.

Not long since, I read an article, advising the sowing of alfalfa seed on ground honey-combed with frost in March and at the rate of five or six pounds per acre, the writer vigorously attacking college and station men who advise thicker seeding.

I could go on and fill this paper with other instances of the kind. They by no means argue against the value of the real farm paper, such as The Missouri Farmer, but they do point out the fact that farmers should be careful to take and read only those papers edited by men who know brass from gold in a farm press article.

C. D. Lyon.

BRAINS ON THE FARM

The farmer who is a money maker studies his profession, is up-to-date and like the man from "Missouri," you have to "show" him.

For the successful farmer learned long ago that "two heads are better than one," and that a careful combination of his own "brain force" with that of others in his own line will do more for him than he can hope to achieve alone. In other words, he judges success by results attained.

If you have a theory on rotation of crops, fertilization, breeding of live stock or a method of soil peparation, you will be plied with questions and demand made that you prove your assertion by weight and measure.

If you claim a better variety of grain the farmer will not hazard a crop by planting his field until he has first put it to the test, and if the test is satisfactory, he will not be slow to adopt it.

The farmer may be from the country, but he no longer has "hay seed in his hair;" unless by test it has proven to be of a specially high grade and fertile variety.

If you claim a certain breed of hog will grow to a larger size, produce more bacon, grow larger hams and yield a larger profit to the breeder, you must first "show" him.

If you have a distinct type of horse with the necessary qualities that make it worth while to raise and which is certain to command a good price on the market, you can win the farmer by proving results and in no other way.

If you say a certain kind of cow will give more and richer milk, yield a larger percentage of butter fat and produce more profit on the same ratio of feed, it's up to you to produce results.

Why?

Because the farmer of today conducts his business with good hard-headed business judgment and not by guess work.

This is not selfishness, it's common sense applied to a theory which has "made good."—***.

DON'T DREAM

Don't dream of when your "Ship comes in." Wake up—row out and meet it. It's a peculiar thing, the resolutions that a man will make at night sitting in front of the fire. He'll look into the fire and plan a campaign of attack to make himself advance at least one step on the ladder of "Dame Fortune," but in the morning when he reaches the ladder he does not take the step. He always thinks that the step will be lower when his "Ship comes in," but thousands of ships have been becalmed only a few miles from shore. It would have taken only a little work to pull out to the ship, get it heading in the right direction to bring it home; and again many more row as far as the ship and then wait in the calm for a breeze to spring up with which to sail to shore, but the live, active man turns his row-boat around, gets a good organization of helpers and tows the boat ashore.—***

Plant Good Seeds.

About the most unprofitable thing a man can do on the farm is to plant seeds that will not grow. Next to that is to plant seeds that have not been intelligently selected and cured out so that they have heredity behind them to give them strong producing power. In our past experience on the farm we have found it very profitable to write each year to a number of seed houses, get their catalogues and study them during rainy hours or evenings. In this issue of The Missouri Farmer our readers will find a fine lot of seeds advertised and a dollar will go a long ways toward filling up the blank spaces in the garden and supplying the table with nice vegetables all next summer and winter.

Don't forget to put in an order for a few packets of flower seeds for the women folks while you are at it.

ALFALFA SEED Choice recleaned alfalfa seed of my own raising, grown without irrigation, $9 per bushel f. o. b. Piedmont. S. E. Morey, Piedmont, Okla. 2153

SWEET CLOVER SEED White and large biennial yellow. Prices and circular on request. Bokhara Seed Co., Box F., Falmouth, Ky.

SEED CORN

Boone County White, Iowa Silvermine, Reid's Yellow Dent (the large kind, pure and a blue ribbon winner, for yield and beauty), 90-Day White Cap.

Clover, timothy, alfalfa free from bad weed seed—all tests above 99 % purity. Don't take a chance on getting foul weed seeds with your grass seeds. Buy from some one who knows what he is selling, we make it our business to know. You can't buy seeds infested with noxious weed seed from us, we haven't got them, we don't buy them. We test every lot of seeds we buy before we buy them.

Write for prices and free interesting seed book to.

HOG CHOLERA ERADICATION

(Continued from page 5)

reported losses from vaccination of approximately 2 per cent is grossly inaccurate and must be based on incomplete or imperfect returns."

Mr. Brandwig in his recent letter says in regard to my work and teachings: "You have been entirely right on this serum and vaccination problem. In addition to the 43 head lost from vaccination I have since lost 60 head, from having the disease brought on my place. This little experience of mine cost me over $1000—which I charge to this system and the Experiment Station."

How much better it would have been to have sent a sanitarian to that neighborhood and organized the farmers into an "anti- hog-cholera club" and he had remained there long enough to kill out the virus on the infected farms instead of sending virus for use in a perfectly healthy herd on a clean farm. But these field experiments will teach the farmers and state officials what not to do, and will hasten the day when better methods will be adopted.

Some interest in what is being done in Missouri has also been manifested by the members of the Legislature of Nebraska, as shown by the following telegram from the Legislative Reference Bureau: "(1) Do you recommend the use of "virus" with serum? (2) In your opinon should the Missouri Legislature repeal the law prohibiting the use of virus? (3) We would like your opinion on the above at length." The essential part of my reply was as follows: "Missouri has never had any law prohibiting the use of virus in vaccinating against hog cholera, but sentiment against its use is growing rapidly among the swine raisers of Missouri. And when they are more fully instructed in regard to the simple and effective methods which our College Extension Department has now in operation in several counties of the State, where we have organized the farmers into "Anti-hog-cholera clubs," for instruction in better hog-cholera clubs," for instruction in better hog-farm-management, and for mutual help in Simultaneous Neighborhood Sanitation instead of "Simultaneous Vaccination," they will all abandon the use of "virus." The commercial and official exploitation of "virus" has been a great hindrance to the control of hog cholera in this State, and the swine raisers are rapidly finding it out. We teach, "sanitation" and "serum-alone" as the safest, surest, speediest and most economical way of getting rid of hog cholera, but proper organization and co-operation are also essential. Moreover, one good serum laboratory can supply all the serum that is needed for every legitimate purpose in the control of hog cholera in any state, if conjoined with a proper system of hog-farm-management and veterinary police regulation such as is advocated by the College of Agriculture."

In Iowa, the State Veterinary is strongly opposed to the use of virus; on the other hand, the College Extension Department is using it. The State Veterinary says that "virus" brought into the state in bottles was the cause of a great deal of the cholera in this state. The Iowa College, through its Extension Department, has been "immunizing hogs," but in my opinion have been "extending cholera" in all the neighbohoods where they have vaccinated any considerable number of herds by the "serum-virus" method. I cannot believe they have diminished the area of infected territory by the use of virus, however large the number of hogs they have saved. And next year they will have just as big a job on hand in the same territory as they have this year.

In Missouri conditions exist, the reverse of those in Iowa, so far as the teachings of the College Veterinary Department and the State Veterinary Department of the Board of Agriculture are concerned—the ex-state veterinarian, and the present officer and a considerable number of the state deputies are advocating the serum-virus "immunization" method; while the Agricultural College and Experiment Station Veterinary Depatment are teaching and demonstrating the use of "serum alone," and the value of active co-operation of the farmers of infected neighborhoods in the application of simple and effective measures of sanitation for the purpose of **eradicating** the **disease** on the infected farms. When the necessity arises for the application of police measures, the State Veterinarian or a deputy of that department is called on to exercise official powers of quarantine. Fortunately, drastic measures are rarely needed. And we are making progress in **getting rid of the disease,** wherever the methods I am advocating are being put into operation.

In Illinois, Indiana and Ohio the conditions, political and otherwise, seem to be such that they cannot take up systematic work in hog cholera "eradication" along the lines we advocate, and must be content to save as many hogs as they can by "immunization," yet keep the disease with them, and do it over again when the next pig crop is ready to vaccinate. Foot and Mouth disease is prevalent in these states and has hindered the work in hog cholera control. But the lessons that the farmers will learn in matters of sanitation, in the handling of foot and mouth disease it is hoped will be valuable later in the eradication of hog cholera. In New York the serum is made at the State College (Veterinary Department). No virus is sent out either to the farmers or to the veterinarians.

Canada uses neither serum nor virus, relies solely on sanitary measures—quarantine and disinfection—to control hog cholera.

I recently met Dr. F. Torrance, the Veterinary Director-General of Canada, at the sessions of the U. S. Live Stock Sanitary Association held at Chicago (February 16th to 18th), and he expressed his approval of the stand I have taken against the use of the "simultaneous" method of vaccination, as a means of controlling and eradicating hog cholera. He believes in killing out the infection by sanitary measures, instead of planting the disease on farms by "Serum-virus vaccination." By making proper efforts to keep cholera out of their country and by taking prompt and vigorous steps to eradicate such outbreak, Canada has not suffered any serious losses from hog cholera. It will be of interest to the farmers of Missouri to learn of the care that is exercised by the Canadian authorities in the importation of breeding swine, to prevent the introduction of hog cholera. I quote from the Contagious Disease Act of Canada:

Sec. 42.—**Importation of Swine from the United States into Canada.** "All swine must be accompanied by a certificate by a veterinarian of the U. S. Bureau of Animal Industry stating that neither swine plague nor hog cholera has existed within a radius of five miles of the premises in which they ahve been kept, for a period of six months immediately preceding the date of shipment, but such swine shall nevertheless be inspected and shall be subject to a quarantine of thirty days before being allowed to come in contact with Canadian animals."

GREAT WESTERN

GET THE WORLD'S BEST SILO NOW!

PAY NEXT SEPTEMBER!

The Most Remarkable Silo Proposition Ever Offered

This is our offer. The finest silo that human ingenuity can produce---sold at the lowest possible spot-cash price, with six months time to pay the bill and no interest. You want your silo ready for use when silo time comes. We're here to put it in your hands now, and you pay for it September 1st, 1915.

Why this special proposition? Here's the reason. We can better afford to give you the silo now, have you erect it ready for use when you have to have it, rather than stack the material up in our yards, waiting for you. Its worth our while, and it's worth your while.

Stockmen, Farmers and Dairymen Who Know Silos, who have a wide acquaintance in their neighborhoods and the respect of their neighbors are urged to write us for full information about the Dickey Silo, and for details of our plan by which they can act as representatives of the Dickey Glazed-Tile "Tight as a Jug" Silo in their localities. Only first class men can be our representatives.

DICKEY GLAZED TILE SILO

"TIGHT AS A JUG"

The Dickey Silo is made of glazed, vitrified hollow clay tile, reinforced by bands of steel laid in the mortar. The hollow glazed walls successfully protect against air and freezing and absorb no moisture, preserving the succulent greens in best condition through coldest winters and driest summers.

You build it once only. This silo cannot blow down, warp, twist, crack, crumble or decay. Never needs painting. Will never need repairs—except for doors and parts of roof, years hence. Guaranteed not to break from ensilage pressure—of the thousands in use not one has ever had to be replaced. Think over this matter of permanency—you'll quickly find it means true economy. It pays to build a Dickey silo.

Buy now, pay next fall: The Dickey Silo proposition to every farmer who wants to be rid forever of all silo troubles and annoyances and upkeep expense, is this—

Order a Dickey Silo now, and erect it now while you have the spare time, so that it will be ready for this fall's ensilage crop. Then next September, when you have harvested your small grain pay for your Dickey Silo. The time price today is the cash price of September, dollar for dollar.

State..... *R. F. D.*.....

"The importer will also be required to produce an affidavit to the effect that the swine he proposes to import have not been immunized to hog cholera by the simultaneous injection of hog cholera "virus" and "serum."

Sec. 88½.—"The use of hog cholera serum and virus being considered a source of danger the importation, manufactuer, sale or use of such serum or virus is prohibited."

It will thus be seen that our neighbors to the north know something about the losses that hog cholera imposes on the farmer of the United States; and they are taking precautions to prevent the disease from gaining a hold in their country. They are wide-awake as to the dangers of spreading the disease by the use of "hog cholera virus."

The farmers of Missouri and of other states can read a good lesson out of the above. Why should not they have as much protection for their herds when they buy breeding animals? Is it any more important for our Missouri swine breedes to have a clean farm, and a clean area of five miles radius around his farm in order that he may ship a registered sow or boar to Canada than it is to ship one to Illinois, Arkansas or even to the next county? I am sure that breeders who have made such shipments deem it fully as important, in one case as in the other, and they would be glad to have like protection when they buy an animal from another state or another county. Since no breeder can ship one of his sows or boars to Canada, if the animal has been injected with serum and "virus," why should he keep the disease on his farm and pander to a false trade-demand for serum-virus treated animals? These are questions which I as sure the swine breeders of Missouri are going to answer in the right way, by joining the "Anti-cholera "Club" movement that has been inaugurated by the College of Agriculture, and which has for its slogan "Simultaneous Sanitation and Serum alone for Cholera Eradication;" versus "Simultaneous Vaccination with its Cholera Perpetuation." The twelve hundred or more breeders of pure bred swine in this state can give an impulse to this movement which will carry it to an early success throughout the state if each will make his own farm a center of a clean-up area of five miles radius, so that his herd can meet the requirements equal to those imposed by Canada. It will be worth all it costs even if Missouri should never ship an animal to that country. And there are hundreds of farmers, who want to raise hogs and buy good boars of the breeders in their county, who will help the breeders clean up an area, not only of five miles radius, but the entire county. Just as now there are farmers banded together in the several counties mentioned to get rid of cholera. There are plenty of reasons why the breeders should not use the "serum virus" method and advertise immune breeding stock; and thus incidentally advertise the fact that they are keeping hog cholera infection on their farms. Such breeders cannot export their animals to Canada, no matter how good the breeding, and the time is surely coming when they cannot ship serum Virus treated animals to other states.

The work which the Agricultural College is doing through its Extension Department in co-operation with the farmers in this Anti-hog-cholera work, will not only put the breeders of the counties mentioned on the approved list of Canada, but on the approved list of many states; and certainly on the approved list of every hog raiser whose farm is free from cholera and wants to keep it free. Such farmers do not want to run the risk of introducing the disease on their farms. Moreover, they do not want to buy high priced breeding animals that are in any degree stunted by cholera or by the serum Virus treatment. And this is liable to happen to the best bred animals in the herd. Breeders who are practicing the simultaneous method know this, and their patrons are finding it out. The adoption by every county of the state of the plans of hog cholera eradication which I have advocated and which the Agricultural Extension Department of the University will aid in organizing will make it possible for farmers of the state to raise more hogs and better hogs at less cost, and to restore the swine raising business to its normal condition. There need be no fear on the part of the farmers that there will not be a profitable market.

Elsewhere in this issue will be found the advetisement of the Chicago Flexible Shaft Co., who put out a little machine for clipping horses and mules. Look it up and read it. It will put your work animals in much better shape for the spring work.

About time to be testing that seed corn—for upon the seed depends the stand and upon the stand depends the crop.

Raise Your Calves Without Milk

Let Blatchford's Calf Meal take the place of milk in raising your calves. Costs less than half as much and the calves are stronger, bigger-boned and healthier.

Help Feed the World

IF the war should stop at once Europe could not recover in time to grow more than a small part of her food crops in 1915-16. With grain at record prices, it will be more profitable than ever to use commercial plant foods liberally ***to hasten maturity, improve quality and increase the yield.***

The middle west is still the garden of the world, and her soil only needs *available* fertility in the shape of soluble commercial plantfoods to make it hum. Germany produces 88% of her food crops in the shape of potatoes, rye, oats, etc., with the help of commercial fertilizers. It pays her to make a fertile soil still more fertile. ***It will pay the Middle West. Fertilize your Spring crops and top dress your wheat This Spring.***

My Low Prices Will Save You Big Money On Any Size or Style of Engine

Three facts explain my low prices: I have a natural gas well giving free power, heat and light. I share this saving with my customers. I have most modern engine-making machinery, further reducing manufacturing costs to lowest point possible. My entire output sold direct from factory to users saves buyers all dealers' profits—an average of $6 to $20 per horse-power.

LIVE STOCK NOTES

By R. P. Royce, Fieldman

Smith's Jersey Offering

J. B. Smith, Platte City, Mo., announces that he will make special prices on about twenty young cows and heifers that have just calved or are due to freshen soon. Readers of this paper who may be interested are urged to write Mr. Smith at once. This is one of the best known herds in the Central West and has been a consistent winner at the various state fairs for a number of years past. Mr. Smith is offering a chance to secure some very high class cows at reasonable prices and it would seem that now is an opportune time to buy. Grass will soon be ready to turn on and the winter feed bill is paid. Mention this paper.

High Grade Holstein Cows

M. E. Moore & Co., Cameron, Mo., who advertise Holstein cattle in this paper write that they have about twenty high-grade young Holstein cows and heifers due to calve soon, that they are anxious to sell. They are pricing this stuff worth the money and will sell all or part. Any of our readers who are contemplating starting in the dairy business will do well to write this firm for their prices.

Thomson's Durocs

W. H. & Geo. E. Thomson, Columbia, Mo., are strenghtening their herd by purchasing a number of very high class sows. Their most recent purchase was the good sow Miss Crimson Co. I Am. This great sow was secured at Chas. L. Taylor's recent sale at the long price of $270. We regard Miss Crimson Col. I Am as one of the greatest sows sold this year. She is by B. & C's Col. II by B. & C's Col and out of Belle of Crimsons by Crimson Wonder Again. She is a litter mate to Crimson Col. I Am, junior champion at the American Royal in 1912. She is bred to Col. Wonder for a rather late litter and unless we miss our guess Thomson Bros. are going to be in a position to offer their trade some very high class spring pigs.

White Buys Select Col. 2nd

A. White, Jr., Palmyra, Mo., has added another great boar to his herd of Durocs. Last week Mr. White bought Select Col. 2nd at the Boyd dispersion sale. Select Col. 2nd is easily one of the best boars in the state and Mr. White is to be congratulated upon securing him. This boar was the second prize aged boar at the Missouri State Fair in 1913, being defeated at the time by Col. Wonder, Chas. L. Taylor's boar that was made grand champion at the same show.

Select Col. 2nd was sired by B. & C's Col. grand champion at Nebraska, Iowa and Illinois in 1911. In 1912 a litter mate to Select Col. 2nd, Col. I Am, was grand champion at Illinois.

Mr. White paid $315 for Select Col. 2nd.

Gildow's Dispersion Sale

The dispersion sale of Poland Chinas held by Dr. John Gildow & Sons, Jamesport, Mo., on Thursday, February, 11, was well attended by breeders and farmers and resulted in an average of $42.60 on forty-eight sows. No doubt under normal conditions the average would have been considerable more but with the quarantine on in the leading hog states Messrs. Gildow expressed themselves as fairly well pleased. A June gilt of Spotted Poland breeding topped the sale at $126. Lady Big Knox, No. 3 in the catalog, sold for $96. Several others sold above the $75 mark.

Col. P. M. Gross did the selling and was assisted in the ring by Cols. J. Zack Wells, Chas. Nelson, and L. R. Hamilton.

Bland's Big Type Polands

Halleck Bland, Centralia, Mo., is offering a number of tried sows and gilts bred for early farrow. These sows and gilts are of Mr. Bland's own raising and for the most part are sired by either King David, an excellent son of old Long King, or by Leader, a son of Grand Leader, one of the best boars that was ever owned in Central Missouri.

Shorthorn Bulls

W. C. Prewitt & Sons, Clarksville, Mo., are advertising fifteen young Shorthorn bulls for sale. Most of the offering are straight Scotch breeding and will range in age from eight to eighteen months old. Mr. Prewitt writes that they are all sired by the State Farm winner, Sultan's Heir 368468 and further states that they are the best lot of bulls they have ever raised. They have been grown out well, and are priced so that the man with only a few cows can afford to buy. Messrs. Prewitt are among the best known live stock men of Northeast Missouri and we take pleasure in referring our readers to their ad. An invitation is extended to any one interested to come and visit the herd. Kindly mention The Missouri Farmer when you write.

W. E. Williams' Sale

The sale of big type Poland Chinas held by W. E. Williams at Silex, Mo., Wednesday, February 17th, did not measure up to expectations. The offering Mr. Williams had prepared for sale represented one of the very best lots that will sell in the state this winter and merited the patronage of the best buyers. Forty-three head sold for an average of $45.19—about $20 under what they should have brought. Mr. Williams has devoted time and money to building up a herd that is a credit to himself and the breed, and we trust that in the future he will receive more substantial appreciation.

Col. W. H. Cooper, Hedrick, Ia., conducted the sale. A detailed report of the sale follows:

Bakers' Best Sale

On Friday, February 19, W. A. Baker & Son, Butler, Mo., held their most successful sale of big type Polands. In spite of bad weather, bad roads, and bad markets, Col. Bob Harriman sold fifty head of bred sows and gilts for an average of $50. Quite a representative crowd of breeders were present and gave liberal support to the offering, and there have been few sales held this year where the local buyers bid up as they did in this sale. Apparently every bidder wanted hogs, and the man who bought had to pay the price.

The top of the sale was $130, at which price Jas. Godman, Devon, Kan., secured No. 1 in the catalog.

Col. Harriman did the selling and was assisted in the ring by Cols. Clyde Robbins, and F. A. Taylor.

No. 1, Jas. Godman, Devon, Kan.	$130.00
No. 2, L. C. Radford, Spruce, Mo	44.00
No. 3, B. J. Ridgeway, Rockville, Mo.	45.00

MARSHALL, MO.

BAKER'S REAL BIG-TYPE POLANDS
Our winnings at the State Fair prove that we "have the goods." Spring boars and gilts of excellent breeding and individuality at very reasonable prices. Also a number of fall boars, big, stretchy fellows.
W. A. Baker & Sons, Butler, Mo.

Report of Faulkner's Sale

The seventeenth annual Spotted Poland China bred sow sale held by H. L. Faulkner, of Jamesport, Mo., on February 10, proved very successful in spite of the foot and mouth quarantine, cheap pork and high priced feed. While the general average was only about $64, somewhat lower than former sales, Mr. Faulkner expressed himself as quite well pleased in view of the abnormal conditions obtaining at the present time.

A large crowd of representative buyers from several states were at the ring side when Col. J. Zack Wells opened the sale by introducing Col. P. M. Gross, who did the selling. Col. Gross has been connected with the horse auction at the St. Louis stock yards for the past twelve years and this was the first pure bred hog sale he has conducted for a long time—but inasmuch as the Col. is a natural-born auctioneer, he experienced no difficulty in conducting the sale. He was assisted in the ring by Cols. Wells, Nelson, Buckingham, Deem, Shepard and Bell.

Barber & Sons, Skidmore, Mo., secured six head of the choicest lots. J. W. Everyman, Gallatin, Mo., bought the top sow, No. 3 in the catalog, for $160. Six head sold above the hundred dollar mark, and only one sold under $40. A complete list of buyers follows:

No. 1, Barber & Sons, Skidmore, Mo.	$108.00
No. 2, King & Stokes, Auxvasse, Mo.	87.00

Jerseys and Spotted Polands

The Ennis Farm, Horine Station, Mo., is making a special offering for March from their well known herds of Jerseys and Spotted Poland Chinas. Mr. Ennis advises us that he is offering young bulls and heifers at lower prices than he has ever sold them before. His is a high class herd and under existing conditions he will no doubt make some very attractive prices. Mr. Ennis also maintains a herd of Spotted Poland Chinas, and for a short time only, he will make special prices on about thirty-five October boars. Kindly mention this paper.

Andrews Spotted Polands

The Andrews Stock Farm, Lawson, is offering a nice lot of Spotted Poland Chinas summer boars and gilts for sale at very reasonable prices. This herd is recognized as one of the good herds of the state and any of our readers who may be in the market for Spotted Polands will do well to write this firm for prices.

JERSEY CATTLE

Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

Jerseys-Spotted Polands

March Special—Jerseys: I will offer for March only, six young bulls, ready for service, at lower prices than I have quoted for six years. Also bred heifers.
March Special—Spotted Polands: For March only I am offering 35 fall boars, mostly October farrow, at $20 each. Order now. Also sow pigs and bred gilts for sale. Free circular.

THE ENNIS FARM, HORINE STATION, Mo. (Just south of Saint Louis)

Jersey Cows

I want to sell 20 head of registered cows and heifers that are either fresh or soon will be. Also four young bulls.

J. B. SMITH Platte City, Mo.

HOLSTEINS

Young bulls and heifers from A. R. O. cows. Sired by Sir Korndyke Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.

M. E. Moore & Co., Cameron, Mo.

POLAND CHINA HERD HEADER

A big, handsome yearling, smooth as silk, good enough for any herd—$30 for quick sale. A few selected gilts, 200 pounds and up, bred for April farrow, $25 each. Pigs, 3 months and over, both sexes, $10 each, 3 for $25. All these are of choicest breeding and individuality and priced the lowest.

K. H. BROWN, - - Bolivar, Mo.

25 BIG POLAND CHINA GILTS

R. L. HILL - - - - - - - Adenhill Farm, Columbia, Missouri

"Last spring my sows were very wormy and out of 110 pigs, we saved only 53, and even these were in bad condition and would not put on weight until I fed them Sal Vet. After that they started to gain.

"This fall I fed Sal Vet to the sows and the pigs came stout and hearty. Out of 153 we saved 123 and they are all doing finely. I would not think of being without Sal Vet. H. F. Hodgins, R. F. D. 4, Lawrence, Kan.

"I have been feeding Sal Vet to my hogs, and want to say that it is O. K. Last week I sold forty-six nice, fat hogs, but my neighbor across the road has lost all kinds of hogs; he buried thirty-five in one day. I have not lost a single one yet. Have thirty-five still on hand, and they are all nice and healthy."

S. A. Wilkerson, Stanberry, Mo.

"I am glad I found Sal Vet. Our pigs to which we have been feeding it, weigh 100 pounds apiece at four months old, and an old mare to which we are feeding it, is looking much better, and is much better, after discharging an enoromus quantity of pin worms."

James W. Raw, Rt 2, Marceline, Mo.

"Enclosed is check for my Sal Vet. My hogs are now healthy, and are doing fine. There has been some hog sickness around here, but my hogs have escaped so far."

Alvin Day, Cornland, Ills.

"Your Sal Vet is certainly all to the good, and you may always count on me to be a booster. When the Sal Vet arrived, our hogs were either all sold, or dead with the cholera. There were five little runts alive, which were considered as good as dead, but, thanks to Sal Vet, they are the best looking hogs of their age in the neighborhood. My one regret is that we did not get Sal Vet sooner, as I feel that we could have saved the whole bunch." LeRoy A. Barrett. Oswego, Ills.

I Want You to Know The Value of SAL-VET

—I want you to feed it at my risk—I want to prove to you on your own farm that SAL-VET will rid your stock of worms, put them in healthy condition, easier to keep on no more feed—more profitable in every way—and less liable to disease. I don't want you to send me a penny in advance—just mail the coupon. I'll ship the SAL-VET just as agreed, let you feed it 60 days—and if it does not do what I claim, then I'll cancel the charge. Is not that a fair, open offer?

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Worm Destroyer — **The Great Live Stock Conditioner**

—is the medicated salt which contains no antimony, fed just as you would feed common salt. There is no dosing—no drenching—no trouble—all animals need it—take to it readily—and so doctor themselves. You will find animals that you do not suspect of having worms just full of them. Stock that have been run-down will take on new vigor, grow thrifty and profitable. Stock kept free from worms will be healthier; will do better, act better, and be in better condition to resist dangerous diseases. As proof of this read a few of the thousands of letters from stockmen who feed SAL-VET — who depend on SAL-VET to help them make greater profits — and to prevent loss.

READ!

"Before I started to feed SAL-VET my hogs were sick, and I had lost six of them, since feeding SAL-VET I have lost none, although some of them were pretty sick before they had access to SAL-VET and had lost their hair. However, they pulled through all right and now have good appetites and are thriving."

ERNEST TRIEBEL,
Route No, 2, Clearwater, Minn.

"After feeding SAL-VET to sheep, hogs, horses and cattle during the past winter, and found it a reliable conditioner and worm destroyer. My stock never looked so healthy and thoroughly conditioned as now."

U. H. SUMMER,
Brownville Jct., Maine.

"My hogs are doing finely; have kept SAL-VET before them for two months and while there has been lots of disease amongst hogs in this section, none of mine have been sick."

GEO. A. ELINE,
Route No. 20, St. Matthews, Ky.

"I have fed SAL-VET to all my stock; it has put them in fine condition, and improved them wonderfully. The cholera has been killing hogs all around my home, but I have not lost a single one. I have never used so effective a remedy."

SANFORD GERST,
South Boston, Va.

"I enclose check in payment of the SAL-VET sent recently. Four times this sum would not begin to pay for the benefit I derived from feeding SAL-VET."

W. H. WALLACE, Franktown, Va.

"I have great faith in SAL-VET. Since feeding it, I can certainly see a great improvement in my stock. I have fed a number of different stock foods and remedies, but have never found any as good as SAL-VET. I am recommending it to my neighbors and others who lost hogs with the cholera."

C. G. FIELD, Hiawatha, Kansas.

READ!

"I am feeding SAL-VET to 750 lambs and about 100 hogs. During this time there has been no sickness whatever among this stock. I consider SAL-VET cheap insurance."

THOS. J. LILLY, Wheeling, Mo.

"SAL-VET is certanly a great medicine. I have been feeding it all winter, so far and since I started, my stock are better than ever before."

ALBERT MEANS, Walthill, Nebr.

"Have been feeding SAL-VET to some of my horses which were very thin and in a run-down condition. They have now picked up in flesh and spirits in spite of the heavy work incident to this time of year."

ELI FURLAND, Artesian, S. D.

"I had a yearling colt which was not doing at all well. I had fed turpentine, tobacco and other worm remedies, but all failed. On the evening of the 19th of February, I gave this colt a dose of SAL-VET and the following day I had plenty of evidence of its value. It is doing the work, all right."

HARRY BRENNEMAN,
Rt. No. 5—Ottawa, Ohio.

"I am well pleased with SAL-VET. I never knew a horse could have so many worms and live. SAL-VET surely brings them—big and small. Horses to which SAL-VET is fed, act 100 per cent better, and what we formerly thought was colic and meanness, was nothing but worms and worms."

J. E. TERKEURST,
271 Dauphin St., Mobile, Ala.

"The more I use SAL-VET the better I find it. My sheep and hogs were never so thrifty and healthy as now. We butchered this week, and did not find a single worm, while our neighbors' hogs are wormy and dying. I have been recommending SAL-VET to them and they are now ready to use it too."

WESLEY CHAMBERS. Bussey, Ia.

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE
AND THE MISSOURI EXPERIMENTAL STATION

Some Questions

What kind of a home do you live in my friend? I don't mean whether it is bestrewn with costly rugs or filled with the carved trappings of wealth—but what kind of a place is the place you call home? Is it a haven of retreat from the World's harsh buffeting? When the night's shadows have fallen and when the day's perplexing tasks are at an end—at that hour, what kind of a place is your home? Do love and laughter abide within it? Are there children who shout for joy and a mother who smiles contentedly through the lines of care which time has written upon her kindly face? Does the tea-kettle sing a lullaby or a dirge? When supper time comes, is it a case of everybody trying to talk at once—hearts filled with that gladness and buoyancy which magnifies the little commonplace happenings of the day into miracles more wonderful than any fairy tale ever told? And when the dishes have been cleared away, the next day's lessons learned and a pan of apples brought from the cellar—is there then a brief spell of sweet family communion in which paying off the mortgage and telling the old ghost story for the thousandth time vie with each other for preference? And lastly, when it is time for the little "nighties," are there little kneeling figures who murmur "Now I lay me down to sleep" and then a bunch of goodnight kisses ere the old sandman comes and the kindly night sends old and young into peaceful slumberland? If your home is this kind of a place—though humble otherwise—I know you are happy and I know, too, that in the after years the boys and girls who may go forth from it will be splendid God-fearing men and women who will leave the World better for their having lived.

What kind of a farm is your farm, my friend? I don't mean how big it is in point of acres—but whether large or small, what kind of an opinion would a visiting stranger form of it? Judging by outward appearances, what would he think of you as a citizen and as a farmer? Are the fences broken and tumbled down? Are the gates and barn doors off their hinges? Does the house yearn for a new coat of paint and does it look as though its occupants had died or moved away? Are the farm implements standing around in the fields where they were last used? Is the barnyard filled with scrubby, ill-fed and ill-cared for live-stock? Does the orchard look as though it had been mangled by the storms of other days with only here and there a blasted tree remaining? If a stranger viewed the place from end to end, would he involuntarily murmur the word "failure" and wonder how much longer the holder of the mortgage will permit things to drift?

Or, is your home a place where everybody loves everybody else—where the most difficult tasks are inter-mingled with mutual kindliness and forbearance—where frowns are permitted to hide the sun for but a passing moment—where everybody works because work is a pleasure as well as a duty?

Or, is your farm—though small and broken—the home of a real farmer who appreciates the dignity of his labor which is bottomed upon the idea of helping to feed and clothe humanity? Are you trying to farm a little better this year than last? Do you regard your farm as a factory for the production of those things which make the World better and happier? Are you the leader of a wholesome conspiracy in which wife, children, pigs and chickens vie with each other in paying off the mortgage? Do the little home, barn, outbuildings and the fences look like they had lately been scrubbed with Dutch Cleanser from beginning to end? Is there a silo which, like a light-house of progress, stands silhouetted against the sky for miles around? Is there music in the call of the quail and does it carry to your ears the message that the whole World is a friend of you and yours? Do the silent stars at night urge you on to more splendid effort on the morrow and do you gather inspiration from the murmuring tongues of field and woodland? Possessed of a home where love is master and engaged in a task where every drop of sweat makes the Earth a better place to live upon—does it not occur to you, my friend, that the farmer has more to live and fight for than any other husbandman the World has ever known? —The Author of After-Thoughts.

Sets Snug With the Ground Over Hill and Dale

FENCING your farm the "Apex Way" gives you the best looking fence that any man could own. Uphill and down dale, the fence fits the land smoothly—every line wire tight—every stay wire standing erect.

It's the "swinging joint" that gives you this big advantage in "Apex Fence." It allows the line wires free play—prevents binding or buckling. Apex Fence is easier to put up—lasts longer and holds its shape better than any other good fence that we know of. It's made of best grade, open hearth steel wire—full gauge, thoroughly galvanized. Write for booklet.

APEX Steel Drive Posts

are made of elastic, carbon angle steel—the strongest and toughest post material known. Drive them into any soil, gravel or soft shale—no post holes to dig—no injury to post. Think of the work they save in a busy season—hauling, handling, setting—save you 8 to 10 cents a post. Burn your fence rows clean—ground the lightning and protect your stock. Nothing is better or more economical than Apex Posts. Do not rot out, break, bend or burn—last for generations.

Write for the "Apex Way" and learn how easily you can save money by fencing your farm the "Apex Way."

HOW THE KNOX COUNTY FARM BUREAU WAS ORGANIZED

In July, 1914, the president of the Federated Commercial Clubs, of the State of Missouri, Mr. William Hirth, suggested, to some of the citizens of Knox County, that as all the Commercial Clubs of the State had decided to boost for a Bigger and Better Missouri, it would be a good idea for Knox County to put on a Booster movement.

In accordance with the suggestion the Commercial Club of Edina, the county seat of Knox County, called a meeting to devise ways and means to put on a Booster campaign. Every one being new at the work it took several meetings of the Commercial Club before a suitable plan was worked out. At the end of two or three weeks, however, arrangements had been completed for a three days' campaign of motor cars filled with enthusiastic farmers and tradesmen who were to visit all the towns in the county.

The committee had arranged a Booster Yell, as college boys would call it, and after practicing on the yell for four or five evenings, in which men from the age of seventy down to the small boy on the street, took part, the community fairly echoed with,

Boosters, boosters, who are we?
Knox County Boosters, don't you see?
Are we Boosters? I should smile;
Knox County Boosters, all the while.

On a beautiful August morning, we started from Edina, and at a given signal about thirty automobiles loaded down with enthusiastic men and women of every calling in life, started on the Booster trip. The cars were decorated with flags and bunting and a large banner with the words Knox County Boosters was fastened to both sides of every car. The caravan carried the Ladies' Quartet of fine singers of Edina and amid the "honking" of thirty auto horns and the Booster shouts a hundred and fifty enthusiastic citizens of Knox County, the Knox County Boosters started on their mission to boost for everybody and everything good in Knox County.

Little did that army of enthusiastic men and women dream of the good they were starting for their county when the auto wheels began to spin on that beautiful August morning. The first lap of the trip was made without incident when the thriving town of Newark was reached about 25 miles from the starting place. As one auto after another rolled into the beautiful city park and unloaded its load of human freight, it seemed that every citizen of the city was vying with each other to see who could do the most to make our visit a pleasant one. And they certainly succeeded, for the pleasant memories of that day will never be erased from the mind of the writer. The speaker of the occasion, Mr. William Hirth, was introduced by Dr. Simpson in that pleasant manner, in which the doctor does those things, always saying just the right thing in the right place. Mr. Hirth told of the object of our trip. We had come together to get acquainted with each other, to do each other good, to help our fellow man, to try and make a greater Missouri and to make every Missourian greater. After talks by several of the party we were invited to a dinner fit for a king served by the good women of the churches of Newark and paid for by the bankers of Newark. This elegant dinner was served to one hundred and fifty visitors without money and without price to the visitors. All regretted to go but on schedule time the people of the caravan bade their Newark friends a fond goodbye and amid the honking of our horns, many of the people of Newark joining the Boosters, we started for Plevna, a delegation from that place having come to meet us.

We arrived at Plevna about 1:30 p. m. and the assemblage of people had swelled to over 200 and the enthusiasm had kept pace with the size of the crowd. One of the beautiful churches was here thrown open to us, the ladies' quartet sang beautiful and appropriate songs, as they had done at Newark, and the talks were by those who had spoken at the first stop. After the meeting here had been dismissed, the large crowd were treated to free lemonade by one of the enterprising merchants of the town.

Hayes Four Wheels—Bigger Yields

GOOD seed, rich soil and favorable weather count for little if your corn crop is carelessly planted. Planting is *just as important* as seed, soil and weather. It is the one thing over which you have complete control—the one thing you can regulate to insure a *bigger yield.*

The Hayes Four Wheel is *guaranteed.* It *must* be all we claim and all you expect. 180,000 users verify that **Hayes** Four Wheels regulate depth of planting to the *fraction of an inch.* Corn all comes up at the same time, allows earlier cultivation, an earlier harvest, a *better quality* and *bigger quantity.*

Hayes Four Wheels guarantee *surer germination* and *quicker growth.* Wheels pack the dirt around the corn to hold the moisture and leave a *ridge of loose soil* on top. Ridge over corn prevents washouts in hilly fields and gives greater surface for sun's heat.

Covers where all ordinary open wheels fail—even in wet and sticky ground. Guaranteed not to clog. Short coupled, light draft and turns in shortest space. *Checks with absolute accuracy,* regardless of team's speed. Cross rows straighter than the way you drive.

The **Hayes** Drop *never misses a hill* Simple, reliable and most efficient. Fewer parts, less breakage and delays. Has no clutch to miss and give trouble. *Never cracks or grinds the seed.* Will drop accurately any size or shape kernel. *No bare spots* in **Hayes** planted fields. No replanting necessary. Increased yields soon pay for it.

Thousands in use for years with practically no repair expense and every one giving *time-saving, money-making* service. No complicated parts to get out of fix. Strong construction, *practically exempt from breakage.* No expensive and aggravating delays in the busy planting season. Easy and simple to operate and can be trusted to unskilled help.

Can be furnished with perfect working Fertilizer or Cow Pea Attachments, Stub Runners or Disks.

2000 dealers. Ask your dealer or let us prove how this planter prevents corn field waste and increases corn yields. Don't make a mistake. Buy the planter that *guarantees* results.

Free book AP of Planter Facts tells all about the **Hayes.** Write for it today—a postal, or if you wish a letter, asking any questions on planting problems.

HAYES PUMP & PLANTER CO., Galva, Ill.

At 2:30 p. m. we started for Novelty and the trip was a delightful one, over the fine roads which the enterprising farmers of that community have built. We were held up, however, on the way, but it was one of the holdups characteristic of the people of that part of Knox County, for when we reached the beautiful and well kept farm of Mr. J. Ed. Taylor, the landlord stood at the front gate, he having taken the lead when we started from Plevna, and beckoned us to turn in. We did, and there the vast crowd was refreshed at the expense of Mr. Taylor. We were loath to leave but duty called, so 40 cars pulled out from Mr. Taylor's and arrived at Novelty on time 3:00 p. m. Our stay at Novelty was one long to be remembered, and one of the beautiful churches there was filled to its capacity. The songs by the quartet and speaking by the citizens was a most joyous occasion. The speakers of the Booster crowd were now more enthusiastic than ever and when it came time to start for home, every one felt that the first day of the Boosters had been a decided success.

The second day we started about nine o'clock from Edina, and by the time the crowd reached Hurdland, which was the first stop, the cars exceeded in numbers of the caravan of the day before. Led by prominent citizens of that wide awake town the cars traversed the principal streets of the city, stopping at one of the churches, which would not hold the people. One hour was here spent in the same way as were the meetings of the day befor e and as we were due at Baring at noon to take dinner we were obliged to leave the pleasant people of Hurdland and go on our mission of gladness and good will.

On arriving at Baring the crowd was larger than ever and the beautiful and modern Hotel Baring, a hotel that would do credit to a city of many thousand people, served a most elegant dinner to a hungry crowd of enthusiastic Boosters. After dinner we assembled at the hall and listened to words of welcome and commendation from a number of farmers and citizens of Baring. The meeting there will not be forgotten by those who were there as it was one of those so fraught with pleasant rememberances that time will not efface the good and lasting impressions made. This ended the second day.

On the last day the Boosters went to Knox City, the home of the Knox

The Missouri Farmer

VOLUME VII MARCH 15, 1915 NUMBER 6

Farmers Should Organize for Selling and Buying

By Geo. B. Ellis, Managing Editor

In a previous article we called attention to the immediate need of organization among farmers that they might be able to hold their own against organization of other lines of industry and commerce. We merely called attention to the advantage of organization for the purpose of both increasing and cheapening production. These alone are sufficient reasons why farmers should be closely united and working together as one man for their own interests and whatever is accomplished along this line must without question benefit all other classes to a greater or lesser degree. But when farmers are organized for production they will study this matter just as manufacturers do. They will study production in its relation to demand as well as to its cost. When they find any product is being produced to such an extent that its sale is not profitable they will divert more of their attention to the growing of other crops. The greatest question before the farmers today concerning the problem of production is to find the most efficient way of doing things so as to cheapen the cost of production. Every cent we can save on the cost of growing a bushel of grain or making a pound of meat is that much added to our profit without increasing the cost to the utlimate consumer.

It is a fact that goes without saying that in every school district there may be found some men who are more successful at growing certain crops or breeding or feeding certain classes of live stock than the general average. When the farmers of a community are closely organized and studying these things together, the methods of the better farmers are put before the poorer farmers and the whole number will be benefited because we have long since learned that there is such a thing as community reputation and whether it be a pure-bred pig, calf, or lamb; a bushel of seed wheat, seed potatoes or seed corn; a carton of butter or a case of eggs; a crate of strawberries or a barrel of apples; whatever the article may be, the community reputation if good brings more buyers, a more ready sale and often a considerably better price.

Should Organize For Selling

However, important it is for farmers to learn from each other and from the experiment station and other sources the best methods for increasing and cheapening production, it will not benefit them any unless they have some control over the marketing of what they produce. I know there are a lot of people in this country who either from self-interest or ignorance of economic laws hold that it is criminal for farmers to make any organized effort to control the marketing of their products but necessity is gradually forcing organized marketing on the producers as a means of self preservation. Hundreds of instances might be cited to show where the lack of organized marketing has been disastrous to the industry. During the last several years there has not been a season but what there were individual apple growers, or peach growers who let the fruit rot on the ground or marketed it at a loss because their own local market was over-done, but at the same time if they had been in possession of information of other markets they could have found sale at a profit. The strawberry business and the melon business are two striking examples of the need of organized marketing. In the first place the individnal grower does not generally produce enough to ship in car lots. In the second place the individual can not maintain a force of men and bear the expense of telephone, telegraph and other sources of quick communication to know the exact condition of every important market so as to know where to consign the daily shipments. Then again the farmer may be an expert grower of some kind of fruit while he may not be a good salesman. If he is a member of an organization he can have the benefit of expert salesmen who are able to get top prices for his products. It may also happen that the individual grower is not familiar with grades or with methods of packing that may be demanded by the people who buy his products and this too can be taken care of by an organization strong enough to employ expert packers and inspectors.

Co-operative Grain Elevators

But there are thousands of farmers who are not growing fruit but whose main effort is devoted to grain and live stock production and who are asking how organized co-operation can help them? Farmers' elevators are now an accomplished fact in quite a number of states and are doing a good business at a profit for the members. The first farmers' elevator we have an account of was organized at Rockwell, Iowa, in 1889, and in 1900 two more were organized. The venture was so new and untried that up to 1904, that is in the first five years, there were only thirteen of these co-operative elevators started. The success of these few ventures demonstrated the possibility of added profit to grain growers and during the next seven years the number in Iowa alone reached 325, which sold 65,000,000 bushels of grain for their patrons besides buying for them 200,000 tons of coal and $750,000 worth of flour, feed, lumber, etc. These co-operative elevators have spread to other states and already a number have been organized in Nebraska, Kansas and a very few in Missouri. If these elevators were not a success and did not pay their members a better profit on their grain than the private-owned elevator, does any one for a moment believe their number would have increased so rapidly and so persistently in the face of strong opposition? It is not within the province of this article to give details about how to organize a co-operative grain elevator or any other co-operative business venture, but such information may be had from the United States Department of Agriculture, Washington, D. C., or the National Farmers' Union, Ft. Worth, Texas.

Co-operative Creameries Are Profitable

It appears to the writer that the most promising field for co-operation at this time in Missouri is among dairymen. There are a half hundred or more towns right now in Missouri where there are enough cows kept and milked to support a local creamery. We have but to study the routing of a can of cream as it is now marketed to see the great and unnecessary expense incurred under present methods as well as deterioration in quality, both of which most surely take just that much off the price of the product of the man who milks the cows. We have in previous articles in The Missouri Farmer published articles from Mr. E. G. Bennett, State Dairy Commissioner of Missouri, and from others showing positively that because of saving the above expenses and losses that the co-operative creamery is able to pay the farmers from four to six cents a pound more for butter fat than the centralizer can afford to pay. Upon this basis figuring the average difference at 5 cents a pound, the man who milks ten cows and sells an average of two hundred pounds of butterfat for each cow is losing annually $100 for patronizing the centralizer system. For the community surrounding a shipping point and having 600 or 800 cows this means an annual community loss of $6000 to $8000. There are now something more than 800,000 cows in Missouri and if we could by changing from the present method of shipping cream to the local creamery, add $10 per cow to the value of the output, we would save the cow owners of the state more than eight million dollars.

How can we save this immense loss? First, let us understand that the price of butter is fixed by its quality. At any season of the year there is a surplus of poor butter and at no season is there much surplus of butter of high class quality. As I write this article I can buy ordinary country made butter at retail for 25 cents a pound, some centralized stock at 33 cents a pound, while high class creamery from a local plant is selling at 40 cents a pound. The extra profits on six hundred cows for one year ought to build and equip a co-operative creamery plant and after the first year the profit over and above what farmers are now getting will be all velvet.

There are other advantages coming to the members of a co-operative creamery aside from the extra price for the butterfat. A great many of the co-operative creameries of Wisconsin and Minnesota are marketing the eggs for their members at a profit of one to three cents a dozen above what they can expect in the ordinary way. This does not come by accident but it comes because of improving the quality of the eggs and by cutting down the expense of selling. The same agents who sell the butter can sell the eggs and rules adopted requiring poultry owners to gather their eggs daily, to keep them in a cool place, to market them regularly and often will cause them to sell at 5 to 10 cents more per dozen than the ordinary grocery-handled stock will bring. During the Census year, 1909, there were sold off the farms of Missouri 71,886,000 dozens of eggs. If better handling and marketing could add only 5 cents a dozen above the price now received the farm women of the state would have $3,594,000 more money to put in their bank account for each year. Again, I ask, is it worth while to do a little thinking, to do a little more acting that will fatten the pocket-book and pay off the mortgage?

The cattle and hog feeders may find it a little more difficult to market their products in a co-operative way but they can do it to their great advantage if they will only stand together. It is the power of a large number of men acting not as individuals but collectively through their chosen agents that gives them the advantage.

Should Avoid Past Mistakes

The experience of the past has demonstrated that it is not wise for farmers or others inexperienced in business to engage in co-operative retail business. About ninety-nine ventures out of a hundred of this kind of co-operation have been disastrous failures. But there are lines where the farmers can profit by co-operative buying. These lines include those heavy and coarser products that are not quickly perishable and that must be handled in car lots. Where there is a co-operative elevator, or creamery or any other co-operative selling agency there is no valid reason why this agency should not be used for buying whatever flour, grain, hay, fertilizers, coal, and other like products used by the members. These articles are all considered legitimate trade for private owned elevators and why not for the co-operative plants? They are all articles that can be handled in car lots and can easily be delivered to the buyer directly without cost of extra handling, storage and insurance, and farmers can make a considerable saving by buying such products co-operatively in car lots. It may in many instances, be found advantageous to buy these products from local dealers because they can well afford to cut their profit to a minimum when they can find the opportunity to sell in car lots for cash and make delivery from the car door and save expense of handling. If farmers want to make these savings they must readjust their methods in both selling and buying and cut out needless expense and risk.

FARMERS MUST ORGANIZE

I have been reading your valuable paper for something over a year. I have read it closely along with some four other farm papers I take.

Farmers subscribe for farm papers for several different reasons. Some to educate themselves, some to educate the boys, and still others because some one has asked him to do so. But the majority of us are taking them for profit and pleasure for the whole family. And your paper is nearly filling the bill.

It is a source of much pleasure to spend our spare moments in reading the advice of able writers, and also the experiences of some of us farmers who are not so able to express ourselves.

I love to read a pretty poem that makes the father and mother look grander and more noble, the wife more lovely and the little fellows if possible a little bit sweeter.

It is fine to know how to make the grass grow greener, the corn to grow faster and the wheat to yield more and at the same time make our lands grow richer and richer.

All these things we must know, and yet, as I read and reflect, I cannot but feel we are neglecting probably the most important phase of the whole situation, namely, the selling of what we do raise. We as farmers and agricultural journals have made no headway along that line. For instance, the papers told us last summer to raise all the cattle, hogs and sheep we could possibly raise, there would be no danger of an over supply now, with half the world at war. From the President down this advice was freely handed the farmer. The prescription being filled and handed him, the farmer took the dose. He is getting the entire benefit of it now. What is the result: 80c corn and 6 and 7 cent hogs and cattle. True we have high priced wheat, but every man in America who has anything to do with the wheat business, knows that 90 per cent of the wheat is out of the farmers' hands. It is simply mockery to tell him wheat is high and he is thereby getting rich. On account of the existing high rate of interest and the dry years we have had, many a poor farmer owed the grain dealer for feed he had bought to carry him till his wheat was thrashed, then as a matter of fact he felt like he should pay his feed bill. Also, notes many bearing 8 per cent, become due or possibly past due. Was he in a position to hold it? The result was he sold it for from 64c to 70c per bushel.

Now comes our packer friends. When the war broke out they sold tons of meat to the foreign countries, far above anything they have ever sold. Meat to the American consumer is as high as when we were getting 10 cents for hogs and cattle on foot. In the face of these things they tell us there is no demand for meat and expect us to believe it.

The query is just this, how long will the farmer and consumer permit this thing to go on? The packer has been trying for years to eliminate the speculator on the open live stock market, and he together with the authorities that are handling the foot and mouth disease have about accomplished that end. It looks very suspicious the way this thing works. Are the authorities and the packers in a combine? I hate to allow myself to think such a thing. Yet when we analyze some of the cases at hand I think I may be pardoned for so doing. The disease is very contageous and I believe in using drastic measures. But surely the government should have men that really know the disease when they see it. Take the St. Louis case for instance. A couple of loads of hogs were shipped east; at the destination it was claimed they found four cases of foot and mouth disease. The authorities were notified and without warning the St. Louis market was quarantined. The eastern shippers and speculators were caught full handed. The case as I understand it was traced back to the farm from which the hogs came and no trace of the disease could be found. The market was again opened and in a few days the same thing repeated. This time the shippers refused to sell to the packers at a loss and held his stuff till the quarantine could be raised. But when the day came to raise the quarantine the government sent them word that they must be slaughtered in St. Louis. And the packer got the 800 or so cattle at his own price, or $1 per hundred less than the shipper had paid for them. And from what I can learn they have never yet found a genuine case in the St. Louis market.

What I want to bring to your minds is just this: the grain speculator, the meat combine and the high rate of interest are all working absolutely against the American farmer. It is folly to expect the young man to stay on the farm and face these conditions.

Unless we organize we are absolutely at the mercy of the grafter. In union there is strength. If we were in a position to tell our representatives and senators and even our President, what we wanted, do you suppose they would not get an ear to the ground? No representative will disregard the wishes of his rural constituency if they are in a position to vote as a unit.

My idea is a wide awake farm adviser in every county in every state. But let us commence at home in Missouri. These leaders could get us together on pending laws, both in Jefferson City and Washington, D. C. For instance, how many farmers have done anything to help pass the farm loan bill at Jefferson City, to say nothing of the one that has been lost at Washington? It would be interesting reading to know how many bankers have told our representatives it is a bad law and should be defeated.

Why not pass a law to put the packer, who deliberately robs us, in the penitentiary instead of fining him $25,000? When we know he will do just what he did this time, drop the price of cattle and hogs 50 cents per hundred the next day and make us pay the fine and put another $50,000 in his pocket besides. Let's get over this Democrat and Republican and Bull Moose doctrine and be men, instead. Work and vote for our interests just as the banker, the elevator man and the packer are doing. We must fight the devil with fire or go down in the blaze.

Howard County.

HOW THE FARMER CAN MAKE MORE MONEY

Why doesn't the average farmer make more money? I was asked to write an article on the above topic. In reply will say that I am not a newspaper writer but a common country clod-hopper, but do not hop many clods from the fact that I have been a cripple all my farm-life. It would take a very wide experience for a man to be in a position to tell why the average farmer does not make more money. I think one of the reasons why many farmers fail is the lack of knowledge in handling and growing of live stock.

Changing this to how **can** the average farmer make more money, my answer would be to first familiarize himself with his life work—obtaining a thorough practical knowledge of such subjects as soil improvement, crop raising, breeding, raising and marketing of stock and farm products.

While the majority of farmers have been denied the advantage of a thorough schooling in the subjects as taught in our agricultural schools and colleges, we are not to be denied what our more fortunate brothers have obtained, who have the advantage of attending these schools.

Each and every one can for a nominal sum receive a thorough training in these subjects by subscribing for a few of the many farm papers and magazines which so ably treat on all the subjects pertaining to the farm and farm life. Through their columns we are brought in close touch with the progressive farmers of our and neighboring states. Many men who have spent time and money working out some difficult problem of the farm are only too glad to talk with the farmers through the columns of the farm papers imparting to us the knowledge gained by them through every-day knocks, thus saving their brother farmers many hours of hard and unprofitable toil. Just subscribing for these papers, having the mail carrier fill our box to overflowing will never gain us one thing unless we have an allotted time for the study of what we have purchased. We must have a system and that system whatever it may be must be strictly adhered to. Thorough organization with practical system strictly adhered to spells success in any undertaking, and success gained in any other manner will be only temporary and must be attributed to that element commonly called luck, which by the way is as good as any when it strikes, but the strikes are not regular and persistent.

The feeding of the stock should have our closest attention and study. By giving careful attention to the tables published from time to time in our papers and in the bulletins issued by our many experiment stations which can be had for the asking, we will be able to work out a balanced ration for any stock that we may be feeding, and the feeding of a balanced ration is the only way to realize to the fullest extent on our feed. The using of the pure bred sire can not be too strongly urged as it is a recognized fact that he represents half the herd in breeding.

Land building is one of the most important things that comes before the farmer and land building must be practiced if we wish to progress. The time was when we thought that our land would last forever. We went on abusing and taking away until almost too late we awoke to the fact that we must give assistance to our ground. We turned to commercial fertilizer but it offers only temporary relief. Our only hope is through our farm-made manure and the growing of the leguminous crops. We must get away from the idea of large areas poorly tilled.

The silo is offering the greatest opportunity of turning what we have been allowing for ages to go to waste into the most profitable gains. Our experiment stations tell us that in the average crop of corn the ear represents sixty per cent of what we raise the other forty per cent is in the stalk, blade and tassel. The greater part of this forty per cent we have been allowing to go to watse for ages. The silo is the solution. By it we are enabled to save the entire crop raised, allowing nothing to go to waste. These stalks that we formerly allowed to stand in the field until spring, we now have converted into the most succulent and palatable feed taking our stock through the winter at half cost of other times, bring them out in the spring sleek and ready to go on the grass in a shape to give us the most profitable gains. The silo also means more stock can be kept on the same acreage and more stock means more fertilizer, more fertilizer means more profitable crops from our land.

Montgomery County.

GREEN CROPS FOR SOIL MAINTAINANCE

My attention has been attracted lately by the number of articles appearing in the farm press, and more especially The Missouri Farmer, dealing with the necessity of keeping live stock for the purpose of maintaining and increasing the fertility of land and drawing the conclusion that this is the only safe and profitable way in the long run. Generally as this opinion seems to be held, I must disagree, not wholly, but in part, in that the alternative to the keeping of live stock for the improvement of our land is as a general thing overlooked and hardly ever mentioned in the agricultural papers; whereas, owing to its ease of application and to its cheapness, it should take precedence in being presented continually to the readers of farm papers.

This alternative is the growing of catch and regular crops in the rotation for turning under, or if the operation can be made more profitable for partial or whole feeding off upon the land. This system does not interfere with the keeping of live stock and the making of all the manure possible, but rather in its practice, tends to encourage it.

No one has a greater appreciation of the benefits to be derived from the application of manure to our land than the writer, but in all fairness to both systems, I must say that results

You Can't Beat Galloway Prices and Quality!

My New Low Down No. 8 Spreader with cut under front wheels and trussed channel steel frame is positively the best spreader in the world. Light draft, endless apron, positive force feed, double chain drive. Just ask for my book, "A Streak of Gold," FREE, and I will tell you the truth about manure spreaders and how to get the greatest profit out of your manure products.

obtained by me taking everything into consideration have been in favor of the green manure crop turned under.

The advice of the agricultural press to grow and feed cattle is good when the factors entering into the process can be controlled so as to show a profit on the operation, but of late years many of the conditions entering into the process have been entirely out of the hands of the feeders, so that there has been great uncertainty and often loss in the financial outcome of the process when completed. Of course, if the carrying and feeding of stock could be so arranged that a profit could be shown on the operation, then it would be most wise to feed stock and apply the manure to our land for maintainance and increase of its fertility. Inasmuch as this seems to be an impossibility under present conditions, it would seem to be the part of wisdom to try to find a method that will accomplish the same result without the intervention of live stock, and this method is the growing and turning under of green manure crops; some as catch crops and some as regular crops for that purpose in the established rotation.

In favor of this method of green manuring may be mentioned its cheapness, its ease of operation, the ability to cover large areas of ground, the absence of any call for funds to put it in operation such as required for cattle carrying and feeding, the short time that passes before returns come in from the slight expense of its operation, the absence of all risk that is ever present in the handling of cattle, and the further fact that lands on which this system is practiced tend to become clean and free from weeds, the seeds of which are carried on the ground in the manure used.

When one's mind is put to the task of devising ways and means to produce the greatest amount of valuable matter to be turned under, it is surprising what a quantity can be produced and at such a small expense; owing to this the wonder grows that the system is not more often and forcibly presented by our agricultural writers, and the only conclusion to be drawn is that they have not had in practice the opportunity of carrying the system into effect.

There is nothing new in the system. It has been practiced largely in European countries, where land is much more valuable than here, and always with beneficial results. We seem, on account of our cheap land and consequently cheap feed, to have drifted into a system of relying on manure for the improvement of our soil, when improvement was attempted. Now, however, owing to the increase in land prices, the high prices of grain and hay, the amount of capital invested in even a few head of cattle, and the uncertainties of the market for the finished product, it seems that the time has come when it would be wise to take advantage of any and all methods that would enable the maintainance and increase of the fertility available in our soil, and to my mind, nothing will do this quicker and cheaper than the growing and turning under, or feeding on the ground, of green crops. R. F. Tesson.

St. Louis County.

THE AUTO-OILED AERMOTOR WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. The gear case, in which the duplicate gears run, holds two or three times as much oil as is required by the mill for a year of constant running, days, nights and Sundays. From the gear case the oil flows through every bearing in a continual stream. It goes out through the thrust washers in the hub of the wheel and is automatically returned to be used over and over again. No oil is wasted. This mill needs oiling but once a year. **Two quarts of oil in the gear case of the 8-foot Auto-oiled Aermotor will keep the gears and every bearing flooded with oil for a year or more.**

The galvanized helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The old Aermotor was known the world over as "the windmill which runs when all others stand still." This new Aermotor with gears and bearings flooded with oil runs in much less wind than the old Aermotor.

The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The Auto-oiled Aermotor, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable.

Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof. There is no friction on any part of the furling device when the mill is running and very little when he wheel is furled. A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service. A band brake, of the automobile type, is used, and it always holds.

If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. The Auto-oiled Aermotor makes all this possible as it can run from one year's end to another with practically no wear and no cost. Water costs nothing. Use it. To let it stand is to abuse it.

If interested, write **Aermotor Co.,** 1146 So. Campbell Avenue, Chicago. Write right now.

Give Your Horses a Spring Hair Cut

Clip Your Horses and Mules Before the Spring Work Begins

They are healthier and render better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better—get more good from their feed and are better in every way. Insist on having

The Stewart Ball Bearing Clipping Machine

It turns easier, clips faster and closer and stays sharp longer than any other. Gears are cut from solid steel bar, enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head. **Get one from your dealer,** or send to us $2.00 and we will ship C. O. D. for balance. Money and shipping charges back if you are not more than satisfied.

THINKS ORGANIZATION IS NEAR

It has been a long time since I have read after the editor of a farm paper that showed any symptoms of "horse-sense" in regard to the needs of the present-day farmer. Most farm papers aim to get "circulation"—some way, and then fill what space they do not want for advertising in giving advice to the farmer: How to raise bumper crops, or how to keep the boy on the farm, etc. What the farmer needs is not advice, but a way, a plan, whereby he can realize a decent return for his labor and upon the investment required to equip the average farm.

I have read a good many trade papers, but have yet to find the one that advises and urges their class to work their forces overtime to produce, regardless of the cost or the effect of such production. Yet the farm papers, so-called, have been hammering away on that topic since I can remember.

The present condition of things, as regards the farmer, leads one to believe that he is going to be "forced" to organize to protect himself. I do not think he will organize until forced and it may be several years yet, but I think the time is near. Farmers living near small towns are greatly handicapped now for there is no market for anything excepting poultry, eggs, butter and cream. Surplus of garden truck, there is no market for—only at a price so low that it does not pay for the time and trouble to take it to town.

All this as preface to the fact I am enclosing $1 for three years subscription to The Missouri Farmer, hoping the editor's "symptoms" may develop into something of real benefit.

E. E. Seymour, Boone County.

Profit of Manure Spreading

Manure spreading time is all the time. If one could only impress on the farmer who does not own or use a manure spreader, the importance of it's year-round use by showing him the actual crop dollars he is losing by refusing to properly spread all the fertilizing material that accumulates in barnyard and barn, he would in the future try to make up for this cash money crop the profit he has been losing.

Hundreds of thousands of good farmers testify that their corn, oats, wheat, hay and other crops have been increased steadily by the application of manures and fertilizers yet through the country are to be seen hundreds of manure piles that are going to waste.

The average farmer who has a quantity of this wonderful barnyard fertilizer on hand can make it more than pay for a first-class spreader if he will top dress his meadows this spring or apply the manure to his corn land or put it on any other piece of ground that really needs it. A good manure spreader will pay for itself on the average 160-acre farm several times over every year, according to the amount of manure it spreads.

A good, well built, low-down spreader if reasonably well cared for, should last from ten to fifteen years. Many spreaders have been in use even longer than this. When it comes to a money-making farm implement there is nothing on the farm that pays a bigger return on the investment or that will continue to pay year after year a bigger profit than a good, strong, modern manure spreader.

The Plow That Insures You Moisture

The Rock Island "CTX" Universal Plow is the best crop insurance you can buy. It's the only plow that leaves no air spaces to cut off moisture from below. In dry weather, water comes up from below to the plant roots just like kerosene comes up your lamp wick. Air spaces have killed many a crop but they won't kill yours if you use

Rock Island "CTX" Universal Plow

On account of its peculiar corkscrew-like shape, the "CTX" goes into stubble, tame sod, trashy corn ground, tough gumbo, heavy clay, etc., and does perfect work in all. Turns the slice *clear over*, lays it *flat* and *buries all trash*. You don't need extra bottoms for the "CTX." This wonderful plow pulverizes the soil so much better that you save at least one harrowing.

Free Plow Book shows how the "CTX" increases yields from 2 to 10 bushels per acre. Write for it.

"IMMUNIZED BREEDING SWINE"

Dr. J. W. Connaway, Veterinarian, College of Agriculture and Experiment Station, University of Missouri.

There is, in some of the hog raising states, a false "trade demand" for immunized breeding hogs, among farmers whose premises are infected with hog cholera germs, and who do not like to risk bringing in new breeding stock on account of the danger of these hogs getting cholera. I think they overestimate the difficulty of getting rid of the hog cholera germs on their farms. Serum companies have stimulated among breeders a notion that it was to their best interests to immunize their sale hogs by what is known as the "simultaneous method" of vaccination. That is, by the simultaneous injection of "hog cholera serum" and "hog cholera virus." The first is a protective substance and the latter a disease-producing substance. This method is used in order to give the hogs a "permanent immunity." But the permanency of immunity cannot be depended upon in all cases unless a tolerably well developed fever is produced, and this in some cases is followed with bad results, and the disadvantages overbalance the advantages.

Every breeder knows that the best breeding animal is one that has never had disease; one that is properly bred, and properly fed, and properly cared for in every way from the time it is farrowed up to the time of sale; and if the sow or boar can be put in the sale ring without ever having been treated with hog cholera virus there is no doubt but the animal is a better breeding animal than one that has had disease, whether it was contracted naturally or produced artificially by inoculation. The observations of many farmers indicate that the reproductive functions of the breeding animals are sometimes injured by natural cholera or by the serum-virus vaccination. And as the injury is just as liable to fall upon one of the very best bred animals, it is desirable to avoid all risks in this direction, and to turn more to the **eradication of the disease** from the farms, rather than to try to **immunize** breeding stock so they can live on infected premises.

The field agents of a number of agricultural papers, whose business it is to visit the breeders and look over their herds, are impressed with the fact that the men who resort to serum-virus immunization so as to meet the false trade demand for immune hogs, are not supplying as good looking stock as they formerly did; or as other swine breeders, who are not trying to immunize their hogs, but are trying to fit their hogs in the best possible way to give good service to their patrons. The "immunized" hog is of course better than a dead hog, but many breeders have found that it is not necessary to resort to the serum-virus method for protecting their herds, and the tendency is to get away from this bad practice, that certainly stunts hogs in some cases and in others has rendered some of them sterile or less productive.

I have at hand a personal letter from one of the best known auctioneers in the country, who lives in an adjoining state. I am quoting, without his knowledge or consent, a portion of his letter bearing upon this matter. For obvious reasons I do not mention his name. He says: "I have put in the last month with hog men in this state and—(an adjoining state). Naturally hog cholera and its treatment was talked quite extensively, and if I can catch the drift at all I feel sure that farmers are more awake than ever before to the importance of **sanitation** as a factor in hog cholera control work. I have had pointed out to me by some breeders of registered stock that it was absolutely necessary that they "immune" their hogs, in order to make good sales; and at some sales which I have conducted that did not go as well as they should, the reason was directed by some to the fact that the hogs were not immune. We have had this happen, and the very next day after such a sale, under practically the same conditions, the hogs not being immune either, a splendidl sale was made. The facts are that the best sale I made in the state this year was for a man who under no circumstances would allow virus to come onto his place. During the last four years this party has had cholera on the farms adjoining him, but has escaped the disease. He protected himself in each instance with serum-alone and sanitation. I visit his place two or three times each year, and I can truthfully say that one making a visit there will always find everything in first-class condition, both as regards the condition of the animals and the sanitary conditions of the premises."

It is my opinion that the time will come in a very few years when no man will think of immunizing his hogs by the simultaneous method and all will protect themselves in the manner mentioned above—by sanitation, and the use of serum alone, whenever vaccination may be required. You will note, however, that in the case of the individual breeder mentioned above, he was exposed to cholera which was on adjoining farms. This man's herd was in constant danger from the disease, by the carrying of the infection by dogs, pigeons and other carriers, and so demonstrated the value of his methods Under such exposure, however, severe losses might happen, in some cases, in spite of the careful attention that was given. If he could have only taught his neighbors how to do the same things, so that they too might be free from cholera, and they in turn would enlarge the area by encouraging their neighbors further on to do the same thing, cholera could be gradually pushed back and off the map. Hence co-operation and instruction and better hog farm management are essential to good results in eradicating the disease.

The Dominion of Canada has regulations against the importation of hogs that have been vaccinated by the "simulaneous method. They fear the introduction of the disease into their country. The fact that hogs have been vaccinated is evidence that they come from infected premises, or that neighboring farms are infected, and no breeder can ship hogs into Canada if the disease is within five miles of his place. Each breeder's farm, therefore, should become the center of a clean-up area which would have a radius of at least five miles, so that he could not only ship breeding hogs to Canada, but to other sections of the country where they do not want to introduce the disease, and to his neighbors in the next county. The breeders of the country can do great good toward eradication of hog cholera if they will banish the "serum-virus" methods and take the lead in their neighborhoods in getting the farmers to apply the simple and rational methods of sanitation and serum alone, in a well organized way, such as is being advocated and being put into operation by the University through its Agricultural Extension Department.

A Good Corn Story

"THREE miles from our farm we rented 55 acres to two men to put in corn on shares. One man put in corn in due time, and cultivated it in the usual way but did not fertilize. The other man suffered an accident and after everyone else was through planting, we found he would be unable to use the land. We sent out four teams and plowed it and planted it. One day we sent out 4 cultivators and gave it one and only one cultivation during the entire season. In planting we put 150 pounds of

Empire Fertilizer

to the acre, the other man used none. Result:—With only the one cultivation, we took off nearly twice as much corn as the other. This, we think, tells the whole story. J. R. CRAIG, Bentonville, Ark."

May we help you to grow your corn this year? Send for our booklet entitled "King Corn" and "Better Crops" mailed free to any address.

SAVE THE FARMER'S THRESH BILL AND GET THE BIG RUN

The Red River Special outfit will do it. It uses the correct principle in taking the grain out of the straw.

It ***Beats it out*** just as you would do by hand with a pitchfork.

Other machines depend upon the grain dropping out.

It saves the farmer's grain and is less liable to break down. It runs steadily and does its good work when conditions will not permit others to do so. It threshes fast and does the very best of work in all particulars, so that the farmer prefers it.

It is the most profitable outfit for the thresherman to buy. It enables him to do more work—better work, and gets him the good jobs. It wears well and lasts longest.

THE EARLY CORN PLOT FOR HOGGING DOWN

If I read the signs of the times aright, the already high prices of corn will by next August bring prices soaring still higher.

Now in legislation our constitution provides for an emergency clause; so should the farmer resort to some practice to tide him over the high prices of those feeds that go to make up an ideal hog feed.

Owing to the great variety of climate in the United States where corn is grown, the corn breeders have given us a number of varieties as to time of ripening—early and late varieties.

Now the thing for the live stock farmers to do this year, regardless of their location in Missouri, is to plant a part of their general planting to an early variety—a real ninety day corn, not corn that is supposed to ripen in 90 days that will require 110 to 120, but a corn that will mature and be ready to feed in 90 days.

There is plenty of such corn and any reliable seed corn house will be glad to furnish such at reasonable prices.

This corn should be planted just as early as the coming season will permit. Along with this early corn, plant about a gallon to a gallon and one half of cow peas or soy beans. For myself, experience has led me to prefer an early variety of soy beans. I plant the corn in drills, then with the same planter, follow the same track and drill in the cow peas or soy beans. [It would be a saving to buy an attachment for the planter and plant both corn and peas at the same time.—Editor]. Give this corn as near level cultivation as the season will permit, and at the last plowing sow five to seven pounds of rape. The corn, being a small variety, will not shade the ground, but what the soy beans, cow peas and rape will get plenty of sunshine and air and all will come along together.

The corn will furnish the fat producing element, the cow peas or soy beans, the bone and muscle making element, and the rape, the tender succulent pasture.

Now by hogging down this feed, you get the manure evenly distributed over the field and every corn plant, rape and soy bean and cow pea plant is returned to that specific part of the field that produced it, in a much better way than could be done by man with the most modern and up-to-date manure spreader.

The plot can be regulated in reference to the number of hogs. By establishing a strong solid post at each end the corn stalks can be used as an intermediate post to hold up the woven wire. A hog with access to such pasture is not going to do anything but eat and thrive and spend very little or no time in breaking fences.

The main crop should be planted to the varieties that do best in the respective localities of the state. The varieties that the farmers know are best adapted to the soil and climatic conditions.

There is another material advantage in planting this ninety-day variety in regions of the state where the soil has not the moisture holding capacity. The moisture accummulated from the fall, winter and early spring rains will make this early corn and get it out of the way of the usual drouth.

I know by experiance this to be a sound farm practice. It will save the labor of gathering and feeding the crop,will help to keep up the soil fertility and eliminate the necessity of buying high priced hog feed.

W. D. McKee, Ray County.

RYE FOR PASTURE AND GREEN MANURE

I sowed rye in the fall late, about October 15, 1913, after a crop of cow peas. I didn't get any pasture from it until April. When it did begin to grow, I never saw so much pasture per acre. I put everthing I had on it and they didn't make any show on it. I believe rye will take care of three grown head of stock per acre for two months in the spring.

I turned the rye under, finished plowing May 16th. It was so high that two men plowing with sulky plows could not see each other across a narrow land. I plowed as deep as three horses could take a good gait and keep it all day—about six or seven inches. I intended to plant corn right away, but it was too dry to plant any thing, so corn was not planted until June 16th.

About six acres of this field was cut for hay, as an experiment, which didn't prove successful with me. It was cut when the rye was in bloom and a green dusty mould formed in it, causing a fog of dust when a fork full was lifted in feeding. As a result three horses had the duct from the eye to the nose clogged with this dust, at least I thought so. One of them got all right after I quit feeding the hay. One eye of each of the other two continued to run water on account of this tear gland or duct being obstructed; a veterinary flushed or washed out this small passage. One of the two horses got well entirely; the other lost one eye. Whether that was due to the blossom dust of the hay, I can not say, having only circumstantial evidence, but I am inclined to believe it was.

The part that had rye cut off and the other was all plowed alike. Corn was planted the same depth, checked. Some of it had fertilizer, 2-10-2; some had no fertilizer; some had soy beans. There was a lot of difference in the fertilized corn a month or six weeks, but when time came to cut it, there was not much difference. Such an unusual season was no test for the fertilizer, but it was for the rye. Where the rye was taken off the ground, the corn was not so good, and when we got ready to sow wheat this fall, the same ground took longer to air out. When the rye was turned under it seemed to hold moisture better in any weather and to dry out quicker on top after a wet spell.

I thought it would be in the way of the cultivation of the corn, but it was as rotten as if it had been plowed under two years instead of two months.

Pam Grinstead, Pettis County.

We are glad to see the increased interest in the subject of green manuring because we consider this one of the first steps toward soil improvement. Humus, that is decayed vegetable matter, is important and essentially necessary to a productive soil. As was demonstrated by the results as shown where the rye was turned under as related in the above article a good supply of humus not only helps the soil to retain its moisture better during a drouth but it helps to aerate it during excessively wet weather. When the green crop turned under is some legume such as clover, sweet clover, cowpeas or soybeans in addition to the humus we have returned all the plant food taken from the soil by the crop and have added whatever nitrogen the crop has taken from the air and nitrogen is the most expensive element of plant food.

Studebaker
WAGONS BUGGIES HARNESS

HERE'S WHAT MR. McINTYRE HAS TO SAY

I purchased my Studebaker in 1874 from Henry Brown of LeRoy, N. Y., and paid for it in wood, cut by myself.

The wagon drew all the stone that was placed in my house and barn. It has never been idle.

All the heavy work that is done on the farm today is done by the old wagon.

It is just as good as it was the day I bought it.

Peter R. McIntyre, Caledonia, N. Y.

As good as the day it was bought —39 years ago

"All the heavy work that is done on the farm today is done by my old Studebaker I bought thirty-nine years ago."

Is it possible to say more in praise of a wagon?

Doesn't it prove conclusively that the best material and workmanship went into it?

—and doesn't it also prove that it pays to buy the best?

The best investment lasts the longest

Suppose you buy a Studebaker Wagon today — and it costs you a little more — but lasts a lifetime — isn't it, after all, the cheapest wagon you can buy?

Studebaker wagons are honestly built of the very best material. Not with the idea of building a *cheap* wagon but the *best* wagon. — and, owing to improved methods of manufacture, Studebaker Wagons are really better built today than they were when Mr. McIntyre bought his wagon — and they cost less.

Durability — long service — have been always the watchwords of Studebaker.

That is why, within the last sixty-three years, Studebaker has grown to be the largest wagon builder in the world.

Studebaker Harness and Studebaker Buggies are built with the same integrity as are Studebaker Farm Wagons.

Canadian Wheat to Feed the World

160 ACRE FARMS IN WESTERN CANADA FREE

The war's fearful devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and there is an unusual demand for Canadian wheat. Canada's invitation to every industrious American is therefore especially attractive. She wants farmers to make money and happy, prosperous homes for themselves while helping her to raise immense wheat crops.

You can get a Homestead of 160 acres FREE and Other lands can be bought at remarkably low prices. Think of the money you can make with wheat at its present high prices, where for some time it is liable to continue. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to the acre. Wonderful crops also of Oats, Barley and Flax.

Mixed farming is fully as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required either for beef or dairy purposes. Good schools, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war.

The Government this year is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Superintendent Immigration, Ottawa, Canada, or

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII March 15, 1915 No. 6

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

The greatest question before Missouri farmers today is "How to make the farm pay?" If you have solved this question write and tell us about it to help your brother farmers.

—o—

Some wise men say the farmers will never organize until they are forced to do so from sheer necessity. Well, may be that is true but then isn't necessity now staring us in the face?

—o—

We need to be organized along both economic and social lines—these two needs must be worked out "hand-in-hand." We must know how to produce more abundantly, how to produce more efficiently, how to produce more cheaply, but after all, unless we are able to sell what we produce at a profit, what will it avail us?

—o—

Will those who oppose organization among farmers for economic reasons tell us why the price of every manufactured article on earth is priced by the maker at what it cost to produce it plus a profit, while on the other hand every product of the soil is sold on a manipulated market at whatever it may chance to bring regardless of what they cost to produce?

—o—

When a feeder buys cattle at the market price and finishes them for market, don't you think he is fairly entitled to the price of his cattle and feed when he sells, together with a reasonable profit for his venture? But a great many men have failed to get their money back this year regardless of the fact that the consumer is paying the same high price for his daily meat.

—o—

Organization for economic purposes, however important, must be associated with organized effort to better our social conditions. The decadent rural church, the oftentimes poor condition of the rural school, the neglected country road and the lack of high class entertainment for farm folk, all demand our most earnest attention if we hope to keep the best farmers on the farm. None of these better things will come to us without effort, neither will they come to us without organized co-operative endeavor when the great majority of farm people are joined together, pulling in one direction, voting together and demanding not an advantage but only equality of opportunity. "United we stand, divided we fall" is a pretty good banner to keep floating from our standard all the while.

—o—

While we are waiting for organized help suppose we do what we can to help ourselves. Why not resolve to plant our seed oats this spring in a better seed bed and to have the seed treated to prevent smut? When our land was new we could get a good crop of oats put in the ground most any careless way, but that is not possible now. We sometimes blame the dry weather for things we ought to charge up to "dry methods." The oat crop is not much of a money making crop at best, but it fills in a very good place in a rotation and supplies some mighty good feed for calves, colts and brood mares and anyway it takes just as much to pay the interest and depreciation on an acre devoted to oats as it does an acre growing wheat or corn, so why not try to make the oat crop a little more profitable? Fifty cents worth of formalin and a half day's work will treat enough seed oats for prevention of smut to sow at least ten acres and the total increase ought to be somewhere between 30 and 50 bushels in the yield. In what other way can you make oats so cheaply?

—o—

FOR A BIG CORN CROP

The renewal of good times and general prosperity depends more on getting a rousing big corn crop this year than on any other one thing we can think of. A good wheat crop will, this year, as it always does, bring some ready money at a very opportune time and because of the relative high price just now much is depending on a good wheat crop, but even a maximum wheat crop at one dollar a bushel will bring little more than one-half as much as a maximum corn crop at fifty cents a bushel. Practically our whole live stock industry depends upon the corn crop for its success. Certainly, then, we should leave nothing undone this year to produce a bumper corn crop. If we get a little more than the market will take at a good price it would be a pretty good idea to just store up a pen or two of good sound corn and hold as a protection against some future shortage.

The first step towards a good corn crop is to have good seed. The fellow who failed to select his seed last fall had better lose no time in getting it ready now. There is likely to be a lot of bad seed this spring and any way every man, whether he is going to plant ten acres or a hundred acres ought to know just what he is planting and the only way to know is to make the germination test. We would not want to plant seed testing less than one hundred per cent good and every man can have that with a few days' work now while the weather is too bad to work in the field. The next important step toward a big corn crop is the seed bed. In a fertile soil full of humus like most of our corn land was forty or fifty years ago it is possible to raise a good crop of corn without much seed-bed preparation. We have under those conditions seen thousands of acres planted right after the plow and with only about three cultivations make a good crop of corn—not a maximum crop to be sure, but a good crop. Under present soil conditions and present prices of corn and the high price of the land it grows on, it is not good policy to plant corn on any but thoroughly prepared land. The extra work on the seed bed makes more plant food available, destroys many weeds and lessens the amount of after cultivation. Let us all start right this year for a big corn crop.

TWO SYSTEMS OF FARMING

In this issue there may be found on another page an article by a good farmer from St. Louis County, Mr. R. H. Tesson, in which he discusses the possibility of maintaining soil fertility by the use of green manuring. An absolute system of grain farming under our conditions in Missouri coupled with a proper use of commercial fertilizers is possible, we think, only on our rich bottom lands, where there is no loss from erosion; and near cities where high priced crops can be grown and where the green manure can be supplemented by manure easily obtained from the city. These are conditions under which our correspondent is working, his farm being located near the great city of St. Louis furnishing him the best and highet priced market for whatever he may produce. It is a well known fact that plenty of decayed vegetable matter is essential to any fertile soil. This decayed matter of course may be supplied by turning under green crops, but what are we to do to replace the mineral elements which we know are removed in large quantities where the entire crop is gathered and sold off the farm?

Based on the level of prices for the last ten years we are safe in saying it would be disastrous for the man growing such coarse crops as wheat, rye, oats and corn, selling them off the farm and trying to maintain the soil fertility by turning under green crops and buying mineral fertilizers at current prices. He might do it if he were growing potatoes and other garden crops which not only take as a rule much less plant food from the soil than the grain crops do, but these crops also bring a much higher price per acre. The other alternative would be to buy cheap stable manure from city stables and stock yards to apply to the crops annually.

But for conditions as they exist in most of Missouri it is much safer to depend upon a mixed system of crop growing and live stock raising, live stock feeding or dairying. In Missouri we have much rolling land that should not be plowed at all. How are we to use this land profitably without plowing it? We must either seed it down to permanent pasture or plant it to orchards and as the supply of fruits is easily overdone, and much of this rolling land is too far away from markets for fruit growing any way, the only thing to do with it is to utilize it for pasturing live stock. It is apparent to any one familiar with actual facts as they are in this state that the greatest loss on our rolling lands is that caused from erosion. Many a plowed field has lost more fertility in twenty-four hours from a heavy rain than the farmer can put back in five years. Time and again we have called attention to this irreparable loss, and urged our farmer friends to plow fewer acres and keep more live stock and sell less fertility off the land.

True, the live stock farmer must grow crops but if these crops are all used on the farm for feeding animals and the animals or products are sold only in the most highly finished form and the manure and waste returned to the land then only a minimum amount of plant food is taken off the land. Roughly speaking if we count the value of plant food in a bushel of grain at twenty cents and that three-fourths of it is returned to the land when fed to stock, we have only five cents worth of fertilizer to buy to maintain our soil, while if we sold the grain outright we would have to buy the full twenty cents worth of fertilizer which makes quite a difference.

The time has come when this question of the maintenance of fertility must be counted as an expense in the production of any crop. The stock raiser may find it profitable to occasionally turn under a crop of clover, sweet clover, rye, etc., but generally speaking he will find it more profitable to turn the crop back to the land after it has served in the process of butter, beef or mutton production.

—o—

SHOULD ENCOURAGE HOME OWNERSHIP

The figures gathered by the United States Government show that there is a decided tendency in this country towards tenantry in the operation of our farms and we are surprised that so far as we know, no great leader among our agricultural colleges or U. S. Department of Agriculture has in any very forceful way pointed out this danger. In fact, we think as a rule the efforts of our agricultural experts have largely been to encourage this tendency rather than retard it. We have more than once pointed out the "big farm" fallacy enunciated by a number of our agricultural leaders. We think it is natural under their present methods for them to fall into this error and as their association is largely with the larger farmers and as riches and bigness naturally appeal to all of us we can see why they may be misled. We are willing to follow the agricultural leaders with implicit confidence in all technical or purely scientific thought, but when it comes to the more important economic subjects—questions which concern the whole human race, we would rather take our advice from the great field of human endeavor rather than the necessarily narrow views of the college man.

Our own college and others, as well as experts from the U. S. Department of Agriculture have been making farm surveys and from the data secured have tried to show that the only profitable farm is the big farm, forgetting that the reason big farms show a better profit is in the men who own them and not in the system itself. It is a fact apparent to any close thinker that as a rule the owners of big farms have them because they have been better business men than their more unfortunate neighbors and if the owners could be transposed and these same big farm owners were put on the small farms, as a rule we would see a difference the other way.

Big farms mean fewer people in the country, fewer home owners to take an interest in good schools, live churches, better roads, etc. It would mean more hired men in place of home owners, more tenants and as a recent survey by the Missouri Agricultural College, has shown it would produce more poverty and illiteracy among the people. This survey made among near 700 farmers of Johnson County representing all classes shows that on the average farm owners had at the end of the year $696 to invest in better living after all expenses were paid while the average tenant farmer had only $368. This survey also shows that among land owners 32.7 per cent of all the children complete the district school course, while among tenants only 12.7 per cent of the children get this far along with their education. The same relative showing is made as to the number completing a high school and college course. Our agricultural leaders would do better to encourage the hired man to become a tenant and the tenant to press forward and try to own a farm, but they cannot do this by trying to prove to him that a small farm is not profitable and that a tenant is getting more for his labor than the land owner. Restricted ownership would mean more profit for the few but less wage for the many.

USE WHAT YOU LEARN

Here is a good suggestion from one of our subscribers about how to get the full benefit out of what you read in The Missouri Farmer. We frequently get a letter from some one asking about something that was a short time before fully explained in the paper. Certainly we are always glad to answer these letters but many times it is worth more to the man if he can lay hold of the information at once and this is a good way to have it ready for an emergency. Our friend, John H. Proctor, of Boone County, writes: "I have been taking your most valuable paper for some time and have found it one of the best helps on the farm I can get. I generally find some special feature in which I am interested in each issue that is a real help at the right time. I keep a blank book right at hand and when reading The Missouri Farmer and I run across any special information I may want to use sometime I note it down in my hand book and so when I need information on alfalfa or other things I turn to that subject in my book which is always near at hand.

"I find most everything fully explained, and keep that before me and if my neighbor should come in and ask about something it don't take me long to tell him even though I have forgotten it.

"Next I advise him to take The Missouri Farmer if he is not already doing so because I think it gives the most information of any paper, for the price, I get. In fact, I think sometimes I get more than is due me according to what I have paid. We take several papers but The Missouri Farmer has the upper hand at our house and we think every farmer as well as business man should take it. I would like to see the paper in the home of every Missouri farmer."

Editorial Comment: We appreciate all the nice things in the above letter but we want to specially comment on the practical suggestion of how to get full value out of what information is in every paper. If every reader would keep this little note book and under different subjects make notations of articles and then keep all the papers filed away where they are easy to get at he will have the information at hand when it is needed. It will not take much space on a bookshelf to keep a year's file of The Missouri Farmer, nor even five years, but any intelligent farmer will be surprised at the great variety of subjects treated if he will look through a whole volume. It does not pay to depend too much upon memory for the farmer has too many things to know to keep them all in his head and ready for use.

MORE MONEY OR GREATER HAPPINESS?

I feel honored by your request for me to write on "Why the Average Farmer Doesn't Make More Money?" I am now 83 years old and being closely confined to my room, I have little to do but read and think. This is a question every farmer in the whole wide world has thought about for ages, and I can not hope to excel their practical solution, which is, I think, they are making all they can under present conditions. I think if the farmers would raise less on the average than they now do they would get a better price for it—they would get more money. The question is more money and is not prosperity and happiness. If money were the supreme measure of all things then money would mean prosperity and happiness. But money is not happiness. If you will raise less and have the market come to you instead of you hunting the market then you make the price instead of the other fellow. The farmer can contribute to his own and his family's happiness by farming less acreage and farming better; by raising more of what you consume—a good garden. Keep more live stock and turn more of the land into pasturage and save hiring labor. A good garden, which is so often neglected by farmers, will supply one-half the family supply.

The supreme thing for the farmer's happiness is a comfortable home, and this is sometimes obtained more by well directed labor—by good management—than by more money.

A. A. Hess, Jonesburg, Mo.

Just imagine the axle of a car TWISTED 3 TIMES without even showing signs of fracture, and you can begin to get a little idea of the quality that Studebaker BUILDS into this FOUR—simply "because it's a Studebaker." For that's the test—as this picture shows—that Studebaker axles have to undergo. And that's the kind of steel that Studebaker develops.

No car that ever goes on the road will ever have to face a trial one-hundredth as drastic as this axle test. But it's Studebaker's belief that every Studebaker Car ought to be built as strong as that—with that much extra safety and that much longer life.

And that is typical of Studebaker's entire manufacturing policy. That is why, for example, you find Timken Bearings *everywhere* in the car, even in the differential. They are the BEST anti-friction device made—and Studebaker uses them. So, too, Studebaker puts into this FOUR at $985 a FULL-floating Rear Axle such as you find in only the highest priced cars.

But you'll appreciate even more what that name of Studebaker stands for on a car when you see this FOUR at your local Studebaker dealer's—and see how Studebaker, knowing the farmer's wants so well, has built into this FOUR conveniences and SERVICE-giving qualities that make it ideal for use in the country.

But SEE it at your dealer's. You'll find it EASY-riding and EASY to drive—and with lots of POWER. And when you study its design, its simplicity, its accessibility and the way it is built to make its upkeep LOW, you'll see why so many men living in the country have bought this FOUR simply

—because its a

FARM MANAGEMENT PAGE

D. H. Doane, University of Missouri

It is not enough to be industrious; so are the autos. What are you industrious about?

Ordinarily we find in people the qualities we are looking for, or the qualities that our own prevailing characteristics call for. The larger the nature, the less critical and cynical it is. The more it is given to looking for the best in others.

How many have purchased cowpeas or soy bean seed to go in the corn field? Next month it may be too late. Intentions now will not feed lambs next fall. It takes deeds; these deeds must be cowpeas, soy beans and rape.

Well prepared is half finished. This applies with double emphasis during the rush time of the spring. Let us apply it to machinery, workstock, fertilizer and seed. It means dollars at the end of the year.

We have published our first summary of the work of the Missouri Farm Advisers. It is in bulletin form and may be had upon application. I wish to quote one paragraph.

"An instance showing the anti-hog cholera work accomplished in a county is taken from the annual report of one of the farm advisers.

"A few remarks concerning the anti-hog cholera work done might be quite in place. Thirty-one herds of hogs were vaccinated in 1914. In twenty-seven of these herds hog cholera was present as indicated by postmortem examination. The other four herds were vaccinated because they were in danger of taking the disease from infected herds. In but one case did the outbreak spread to an adjoining farm. In this instance little pigs from the neighboring farm came down the road and exchanged greetings with the sick hogs through the fence. . . . . The value of the hogs saved in diseased herds through the single serum treatment exceeds $3800 for 1914. This does not include the value of one of the largest herds in which the disease has not yet run its course, but which at this time is doing exceedingly well."

Quoting further from some of the back reports from this county we find these conditions: Work began April 1, 1913—up to December 1, 1913, eight months— 3700 hogs were vaccinated, 462 hogs per month, which marks a fight with one of the worst epidemics in the county. In the fall of 1913 the anti-hog cholera club project was organized and a man left in the county to do follow-up work. The campaign appears to have been effective. From January 1 to December 31, 1914, twelve months, 924 hogs were vaccinated, 77 hogs per month. As an addition to these statements, we should consider the fact that one of the worst epidemics known has existed on the borders of this county during the latter part of 1914."

The Many Sided Farm Adviser

We are wont to think of the different Farm Advisers as being employed primarily to vaccinate hogs, assist in getting stands of alfalfa, and work in a general way to increase the yield of crops in the county. The following, which is taken from one of the news letters of C. M. Long, Farm Adviser in Johnson County, brings out the very human side that these men possess. They are just the same kind of people we are. They have a desire for work and success; they are ambitious to accomplish things worth while, and they have their shortcomings and their sympathies. The following illustrates the last point.

"One from the ranks of our boys and girls is gone. One of the brightest of our land. One that helped her district to win first place in the township and later in the county. Last fall when I visited Cass school and explained about the school exhibit, one of the first pupils to offer to take part was Hazel Reed, a sweet-faced, bright-eyed little girl twelve or thirteen years old. I had never seen her before nor have I seen her since until yesterday, but I remember her. I remember asking Miss Wilkerson about her. She seemed so wide awake. She proved that she was awake for at the County Exhibit at the round-up she scored highest of any girl in the county in her class. This score won her a trip to Columbia, but illness came and she was not able to make the trip. It was decided to save it for her until next year.

"Friday night at the Farmers' meeting at Cass school it was reported that she was dangerously sick. Friday morning word came to the neighbors where I was visiting that Hazel had passed away. The neighbor and I went over. The father led me to her bier and, laying his hand on my shoulder, said, as the tears streamed down his face, 'Mr. Long, this is my little girl who won the trip to Columbia, we are going to use that money for a little stone to mark her resting place.' Surely no more fitting use could be made of it.

"We would remind the sorrowing parents that she lost that little earthly trip to join the great caravan on their journey through eternity, that the happiness she experienced in the possession of the little prizes she won only in the faintest way exemplifies the happiness she enjoys from the prizes won in that better land. Remeber that thousands have lived out their three score years and ten to less purpose than this little girl of a dozen summers."

Waste of Time of Work Horses

Under this heading I have had quite a good deal to say on this page from time to time. I have said that I counted it one of the biggest wastes on Missouri farms, and that it presented one of the greatest opportunities for improvement in the state. Along this line I am interested in what Mr. A. D. McNair of Washington, D. C., says about conditions in Arkansas.

"There were 435,000 mature horses and mules in Arkansas at the last Census, yet with proper crop systems 300,000 work animals would have produced as much agricultural wealth. The acreage of crops per horse for the entire State was about 12½, whereas, with the lesser number of work animals it would have been 18 and a fraction—a very moderate acreage per horse under a good system."

It appears, therefore, that Arkansas farmers boarded 135,000 work animals for nothing, and as it costs about $100 per year to keep such an animal, there was a loss of thirteen and a half million dollars to the State in one year of feeding, caring for, and having money invested in these unnecessary work animals.

"Investigations that are not quite complete indicate that on a group of nearly sixty farms from which records have been obtained, there were not more than 100 days of productive work per horse in the year 1914, and it will possibly fall below this. It is apparent that this waste of time on the part of the teams is one of the largest losses that farmers suffer. The remedy is plain enough—diversification, with proper size of farm, in such manner or with such crops as will keep teams reasonably busy the year round."

After reading the above I thought it would be interesting to see what the situation is in Missouri, for surely our conditions would be better than those in Arkansas. Here is the Missouri situation.

According to the last census we have about 14,335,588-crop acres in this state. That means that we have about that many acres of land devoted to some kind of crops. Subtracting from the total number of horses and mules in the state, the colts and young stock, it gives us just a few over a million head of work animals. A simple process of division shows that we have one work animal for about every twelve acres of crops. Investigations of the Farm Management Department here at the Agricultural College show that on a well managed 240-acre farm a mature work animal will easily handle twenty-four acres of ground when averaging all crops together. If this figure is correct, and it has been verified in other states, it means that we are supporting practically double the number of work animals needed. Further investigation covering quite a good many farms shows that it costs about $85 a year to keep a work animal. This shows us that we are paying an excess feed bill of about fifty million dollars a year. Quite an item, is it not? I feel that it verifies the statement I have made before, that the work horse problem is one of the most vital and far reaching that confronts our farmers. Figure out your own situation and see how it can be improved.

A FARM BOY'S OPINION ON SILAGE

I am seventeen years old, have always lived on the farm and think that is the most interesting place for a boy to live.

In the fall of 1913 father and I built a "Common Sense Silo," sixty tons capacity. It is twenty feet high, fourteen feet in diameter, made of 2x4's, seven sided and lined with rubber roofing, which makes it air tight.

On account of scarcity of feed we began using our silage November 1, 1913, and we fed ten cows, six horses and a few calves. I do not think it can be beat for calves. I have found that this amount of stock will consume about four feet of the silage in seven weeks. The cows will milk longer and give a better flow than when feeding anything else we have tried. We feed each cow about twenty-five pounds a day and they seem to relish it as much as corn chops or wheat bran. Benton Steel,
Halfway, Mo.

It is the opinion of a number of farmers that growing soybeans with corn helps to keep out chinch bugs. What has been your experience? Write and tell us.

Creating a New Art

At the Centennial Exhibition at Philadelphia, the exhibit of the Bell System consisted of two telephones capable of talking from one part of the room to another.

Faint as the transmission of speech then was, it became at once the marvel of all the world, causing scientists, as well as laymen, to exclaim with wonder.

Starting with only these feeble instruments, the Bell Company, by persistent study, incessant experimentation and the expenditure of immense sums of money, has created a new art, inventing, developing and perfecting; making improvements great and small in telephones, transmitter, lines, cables, switchboards and every other piece of apparatus and plant required for the transmission of speech.

As the culmination of all this, the Bell exhibit at the Panama-Pacific Exposition marks the completion of a Trans-continental Telephone line three thousand four hundred miles long, joining the Atlantic and the Pacific and carrying the human voice instantly and distinctly between New York and San Francisco.

This telephone line is part of the Bell System of twenty-one million miles of wire connecting nine million telephone stations located everywhere throughout the United States.

Composing this System, are the American Telephone and Telegraph Company and Associated Companies, and connecting companies, giving to one hundred million people Universal Service unparalleled among the nations of the earth.

MOVEABLE SCHOOLS OF HOME ECONOMICS

In a previous article we have shown how a desire for greater knowledge about the things of the home has been created among our girls and incidentally among many of the women.

We hope to meet this desire by Moveable Schools of Home Economics as have been conducted here the past two summers. Summer before last the first schools of this kind in the State were tried out in our county. Two plans were followed. In ten cases the schools were of three days' duration and in four cases they lasted six days. In the three days' schools only lectures were given. In the six day school lectures were accompanied by demonstrations. The latter method proved the most effective and this year eleven schools of six days each were held.

Enough equipment was secured to put the entire school to work if not more than 25 were in attendance. The teachers were selected by the University and the Farm Bureau and were paid by the community in which the school was held. The teacher received $25 and board. Sometimes it was necessary to bring material for demonstration. This made the schools cost from 25 to 32 dollars. The money was raised in various ways. In one instance a Grange guaranteed the money, gave two entertainments and found after the school was over that it had $3.50 in the treasury more than at the beginning. The school was free to grangers and nongrangers alike. One school district paid for the school out of its incidental fund. The most popular way was to have a supper at the close of the school as well as to sell some of the products secured during the week. No trouble was experienced in financing the schools.

Johnson County Home Economics School at work. They learn to do by doing

The subjects considered and demonstrated were cooking of meats, bread and bread making, canning fruits and vegetables on farm and cutting and fitting garments. In many cases a morning session was held with the girls to take up candy making. Where the community wished it a night meeting was held where the instructor talked on modern conveniences in the home and a physician discussed cause and prevention and cure of infectious and contagious diseases.

These schools were attended by about 800 women and girls and how well they were appreciated the following letters attest:

"The school of Home Economics has been a great blessing, an inspiration to us. It has helped and encouraged us in our effort to make the daily work in the home of fascinating interest instead of monotonous labor—and to make housekeeping an inspiring profession instead of deadening drugery. It has helped us to think of cooking as a success and home making as an art.

"We have long had a craving, a burning desire to ask the 'why' and reasons for doing this or that about our cooking; and our teacher had so much patience to give us reasons for each step taken. In three cases, three generations were in attendance, and the grandmothers enjoyed the lessons with the grand-children, only regretting that they could not have attended such schools when they were young.

"The school has helped our community in many ways. It has instilled a desire to have this as a part of our regular school work and to make an annual affair of the school for the older folks. Also a desire for a building suitable to accommodate these community meetings."

Another school writes:

"It would be difficult indeed for just one person to give an estimate of the good accomplished by the school of Home Economics just held here. We know from the large number in attendance each day, and the great interest manifested by each and every one who attended, and by the excellent co-operation of many who attended in the work we attempted to do, that much interest has been aroused in this community. Many have learned the 'why' of so many things we do in housework that they did not know before. Many have learned to look at home making from a different viewpoint from which they have in the past. And to feel that home making is a pleasure and a profession rather than a drudgery and a nuisance that must be 'endured' because it could not be 'cured.' Many learned that these schools were not simply 'cooking schools' but that the aim was to teach how to prepare the articles of food for the human body the way they are best suited to the use of the body—to promote health and repair the waste which is taking place at all times, and to build new tissues in the body of the young.

"This was our first school but we are proud of the results. We feel that next year, should it be possible, we will have a larger, better school than this. We earnestly hope not only to have a school here at Walker but hope there will be one in every district in Johnson County."

And this is what another says:

"I, like a number of others, expected to use the laboratory method in our school of Home Economics, but owing to lack of equipment we could not. However, the demonstration method was very satisfactory.

"I feel repaid for all of my efforts in fostering this movement in the knowledge of 'why' we do certain things to get certain, definite results. I feel further repaid in the ambition of our children to put these lessons in practice for school, county and state contests. The ambition to be winners in all lines of work has been the direct result of our School of Home Economics." C. M. Long,

Johnson County Farm Adviser.

HOW TO INTEREST THE BOY

Last Saturday I called to David to come and let me take his picture holding the roller that guards the creep for the little pigs. With a whoop he led the way. David, like all boys, likes to be master of the situation and make a success, which gives them self-confidence. Let a boy make failures and he soon loses heart, but when he takes care of the hog house, takes intense interest in his pets and pet schemes of handling the pigs and other stock, you will not have to frown much when a mistake happens but may correct it yourself. Use tact in getting the utmost confidence of the boy, and when you gain his confidence the boy is certain of success.

David at the pig creep

If you will look closely at the picture you will see behind the roller and above is a hopper with 100 bushels of shelled corn ready for the pigs. This calls the little pigs in. Should this roller be a stationary board when the pig's jowls get larger most every day a pig would get fast. Here on our farm with a use of two years not a pig has been fast in it. These creeps are essential in that when the milk from the sow is insufficient the pig can go and crack corn any time.

But should the sow in the next sty be singing a lullaby to her litter at her breast, these husky big fellows are sure to jump in and a waning litter is the result. With corn on tap along with his own mother's milk when he clambers over the younger litter, they resent his intrusions by violent thrusts of their tusks, which sends him off with a twist of the tail and a grunt as much as to to say, "I don't care I have enough any way." And, by the way, when the tiny pigs are about a week old we spend time watching them suckle as their tusks are as sharp as the point of a knife and pointed like a pen which causes terrific losses in litters and make some over-grown pigs and some runts. We have a tool box and in this box is a 25-cent pair of pliers and the boys know just how to nip these points and then the piteous wail of a starving pig is silent. The sow, too, enjoys peace in the family.

We have 14 stys in this hog house, one of them is used for the hopper with a retreating and dropping floor giving most all of the sty for the pigs while above is the corn. Look over David's head and you will see sacks of tankage which cost $50 per ton. This tankage is fed dry and the pigs do not sicken from it as when fed as slop. I find an excuse in not using slop in that I get mussed up, and a terrible loss of feed, while dry corn, dry tankage is quick to feed and with no waste, and very conducive to mastication. These sacks of meat meal are up high over a sty out of the way, still easy to get to.

At David's feet is a faucet with water on tap the year round direct from the storage tank a fourth-mile away, and this one is used only in winter while the outside one is for summer use.

Possibly I should explain that all the doors to the individual stys do not swing on hinges but are on a track over head as a sliding barn door, and the gate in this sty with the roller is pretty open.

E. E. Laughlin, Bates County.

The greatest farm product is the farm children and we think more attention should be given to those activities that will get the boys and girls interested in the every-day things about them. Love for work is the first step to success, and if children can have this love for their work instilled into their susceptible minds they will become so interested and enthusiastic about their tasks that they will require very little attention for government. It will soon give them more self-confidence.

Growers Products for Sale

During the past few months of the winter the effort of the Exchange has been spent in locating and listing pure bred seed among farmers in Missouri. As a result we now have a very complete list of seed. The quality of this seed is good. Most of it is offered subject to the test made for the grower by the Government Seed Testing Laboratory. We have the samples sent in to this office, send a sample on to the laboratory here, and request that a copy of the report be sent to us and the grower. This makes it very convenient for the member selling the seed to describe it, and assures the purchaser of what he is getting.

By writing us a card you can get information about the following articles: Seed Corn, Seed Oats, Cowpeas, Soy Beans, Alfalfa, Clovers, Rape and other products in which you are interested.

Members of the Exchange wanting a complete list of Seeds and Feeds should request it of the Secretary as the list has been completed for spring distribution. Address, The Missouri Farmers' Exchange, Columbia, Mo.

The New Janesville Plow

Only One Lever Needed

We have done away with the bothersome second lever. This one lever working with the foot lift controls the plows while plowing deep or shallow.

Operate Foot Trip Only

Set the depth lever to plow as deeply as you wish, and you are fixed for the day's plowing, operating the foot lift only at the ends of the field. Simply press the foot trip, and the plow enters the ground point first; touch it again and out it comes. This simplicity in construction takes a whole lot of work and worry out of plowing as you go round after round in any kind of a difficult field.

Floating Bottoms Assured Depth

The depth of the furrow is the same all over the field, up hill or down, as well as in the hard spots. This is regulated automatically by the hang of the plow bottoms in the frame. The plow bottoms have just enough motion at the cutting edge of the shares to take away the "pinch" at the plow points as they turn over the furrow. It is somewhat like the flexible movement that you get in a spade when digging into hard ground, you must work the handle a little before the spade will enter. This easy motion reduces the all-day pull of the team as the plows glide through the soil.

Easier Pulling

Don't forget the sun-baked fields in the late summer when your poor horses will have to sweat and pull to turn over the hard ground, or next spring when the work is rushed and your colts are green. This flexible movement is found only in a plow like the Janesville. The proper suck of the bottoms is self-regulating according to the depth you are plowing, and as the shares become dull more suck is added, another feature found only in the Janesville.

No other wheel plow hugs the furrow wall like this New Janesville. This provides steadiness, allows more tug room, insures even width of furrows, and makes easier work for you and the horses.

These are only a few features found in this New Janesville, but they help take the hard work out of plowing. You save your team, you have an easier day yourself, and you speed up good plowing with less effort.

Write for Booklet

of many actual field scenes showing how the six times World's Champion won with Janesville Plows. It's the secret of all good plowing and how it is done. Write for copy.

Shinn Gets There First

"It seems to me that every farmer in Missouri should be willing to pay 33⅓ cents a year for a paper like The Missouri Farmer." This is the sentiment which is expressed in hundreds of letters which reach us from all over the state. Don't you think so too?

Poultry Department

COTTON SEED MEAL RATION

Feed at this time is very high. Many leading poultrymen are writing to the Missouri Station to find what feed that they can use to substitute for high-priced wheat. Cotton seed meal is the cheapest source of protein that can be obtained. The cost of protein in cotton seed meal is about one-third the cost of protein in wheat bran.

When we were in Experiment Station work in Mississippi, we could see little profit to poultrymen who bought high priced wheat for poultry. Wheat has always been high in the South where it is not raised. We worked for sometime on the cotton seed problem and our experience thoroughly convinced us that it was an efficient poultry feed. Many of the northern stations had tried it and asserted that the hens would not eat a ration in which cotton seed meal formed the chief source of protein. Our Mississippi hens ate it and produced good results.

A test of the value of cotton seed meal is being made at the Missouri Poultry Experiment Station and I am not basing what I say on the work at the Station as the test is not sufficient to give definite results. But one thing that we do know is that Missouri hens will eat a cotton seed meal ration. One of the cotton seed meal pens is going to eat about fifty pounds of the cotton seed meal ration the first month. The cotton seed meal fed pen has ten hens in it and every hen is laying. So you need not worry about the hens going hungry on a cotton seed meal mash.

The first few days of the little chick's existence are the most important ones. State Poultry Experiment Station, Mountain Grove.

The Growing Stock

Many of you are going to have late hatches and will need to push the stock for growth. Right here many millions are lost on American farms as so little attention is paid to forcing the stock for growth in order to get them to laying in the early part of the season. A pullet that you cannot mature before fall is not often profitable, for she will generally wait until spring to lay her first egg.

We are modifying the Cornell feeding method by making a substitution of cotton seed meal for the beef scrap. Where wheat is not available and when you are forced to buy it at prevailing prices, I believe that it would be possible to use corn and force them to eat more of the mash. Just feed them the grain ration once each day. Bone meal is an important part of a chick ration as it supplies a large amount of ash which the growing chicks require. It is possible to substitute crushed oats for the bran or wheat middlings with good results.

On many Missouri farms cotton seed meal is the most available ration to be had to supply the protein for growing chicks or laying hens.

The Ration

Mixture No. One—8 lbs. rolled oats, 8 lbs. bread crumbs or cracker waste, 2 lbs. cotton seed meal, 1 lb. bone meal.

Mixture No. Two—3 lbs. wheat (cracked), 2 lbs. cracked corn (fine), 1 lb. pinhead oatmeal.

Mixture No. Three—3 lbs. wheat bran, 3 lbs. corn meal, 3 lbs. wheat middlings, 4 lbs. cotton seed meal, 1 lb. bone meal.

Mixture No. Four—3 lbs. wheat (whole), 2 lbs. cracked corn, 1 lb. hulled oats.

Mixture No. Five—3 lbs. wheat, 3 lbs. cracked corn.

The Method

1-5 days—Mixture No. 1, moistened with sour skimmed milk, fed five times a day; Mixture No. 2 in shallow tray containing a little of No. 3 (dry) always before chicks. Shredded green feed and fine grit and charcoal scattered over food.

5 days-2 weeks—No. 2 in light litter twice a day. No. 3 moistened with sour skimmed milk, fed three times a day; No. 3 (dry) always available.

2-4 weeks—As above, except that the moist mash is given twice a day.

4-6 weeks (or until chicks are on range)—Reduce meals of moist mash to one a day; Mixture No. 4 in litter twice a day; dry mash always available.

6 weeks to maturity—No. 3 is hopper fed. One meal a day of moist mash if it is desired to hasten development.

You will find the chief difference in the use of cotton seed meal mash and the beef scrap mash is that they do not eat quite so much of the cotton seed meal mash as they do of the beef scrap ration. As a consequence, there is a portionate difference in the growth but where they have access to the fields they will largely supply bugs and worms.

The efficient hen is the early layer. It is a problem with the early incubator hatched chicks to keep them from laying too early but the average farmer does not have this to contend with and his chief problem is to get them to maturity in time to lay.

We are great believers in advocating feed that is available. The more you shorten up your feed formula and keep the feeding value, the greater the chance of getting the farmers to use it.

We get reports nearly every week of fine results obtained from the use of cotton seed meal and we find a greater interest in the balanced rations in communities where cotton seed meal can be easily had.

Mr. Hare, who was formerly with the Poultry Division of the poultry department, has issued a bulletin advising the use of cotton seed meal by southern farmers, as he says that his observations have led him to believe it is effective in egg getting.

The Bureau of Animal Husbandry has recently sent out a modification of the three rations used at the Mississippi Station for general use in the South.

J. H. Morrison,
Missouri Poultry Experiment Station,
Mountain Grove, Mo.

Variety is essential in feeds, but make up the variety as much as possible from home-grown feeds.

RAISING BABY CHICKS

Strong, healthy, vigorous chicks are produced only from properly mated parents. The first eggs that pullets lay, even if fertile, will produce weakly chicks; using immature cockerels will also bring like results. Keeping your eggs too long before incubation will weaken the germ and bring you a lot of chicks of low vitality which will never mature as they should. Inbreeding if indulged in for more than one season will also lower the vitality and vigor of the young. These are some of the many things that make baby chicks hard to raise, taking it for granted that you have a lot of strong, healthy baby chicks just hatched. What is the best method to care for them? Your good old mother will be the first one to give advice for she has had experience along these lines for more years perhaps than you are old. Then the nearest neighbor tells you how, then the medicine man comes along with his household and chicken remedies and he tells just how it should be done, and they all differ in their mode of care. So it will be all along the line. I have my idea about the matter, which I have used with a reasonable degree of success. In the first place the first forty-eight hours of a baby chick's life should be a very quiet one. They need rest and quiet and no food whatever while the system is absorbing the yolk of the egg which is always in a baby chick's system. I think a great deal of bowel trouble is brought about by feeding them too soon. The first feed is hard boiled egg, cut fine. After a day I begin to feed steel cut oatmeal sprinkled in bran. I use bran for litter instead of chaff, but renew the bran often or they will soon be eating their droppings which might cause trouble. Also furnish them some fine grit of some sort. In 10 days I begin feeding the regular commercial chick feed (mixed grain). I adhere to the dry food ration and never feed moist, doughey or sloppy feed of any sort. If you let a little chick get damp and chilled you have a sick, stunted bird. Never have a lousey baby chick if you can avoid it, and you can dust your hens when you set them with a lice powder and again a few days before the hatch and there is little danger of any lice appearing on the newly hatched chicks. The old time custom of doping a chick's head with grease to kill the lice is death to the lice and also nearly death to the chick. It usually gives them a cold, stunts their growth and makes a scrub out of what might have been a prize taker.

As soon as your chicks are ready for open air and out-door life you should have a patch of rape provided for them. This is beyond any question the best for little chicks. It furnishes shade, green food, bugs and insects, shelter from sudden rain storms, absolute protection from hawks and crows. Sow it broadcast and don't be too pinching with your seed. If you will try this once you will never try to raise a bunch of chickens without the rape patch.

Keep dry bran in a hopper for your growing chicks all the time. It is a good bowel regulator and develops strong, healthy fowls. It will surprise you how much they will eat if they have free access to it at all times.

E. L. Andrews, Maryville, Mo.

RAISE PUREBRED CHICKENS

In response to your request for experience in poultry raising will say: It is now seven years since I decided to quit the scrubs and to raise purebred poultry. I chose the Barred Rocks for my favorite. I had been told this breed were all-purpose fowls and laid eggs when eggs were a good price. So I bought a few settings of eggs from a reliable breeder and from these eggs I raised twenty pullets. I sold the cockerels at 75 cents and that gave me clear money enough to buy a good cockerel to mate with my pullets. The new cockerel cost me $7.20, which was quite an investment for a beginner and some of my neighbors thought I was wasting my money, but I did not regret what he cost.

I have always had since I started with pure-bred chickens a nice flock, have sold breeding stock for many times the amount I invested and have had the satisfaction of having something worth while to work with.

I have made it a practice to ship my surplus fowls direct to a St. Louis groceryman and as a rule I get two cents a pound more than for mixed coops, which in time makes quite a difference.

I have found that to live up to the motto, "Keeping everlastingly at it brings success."

Ernest Meyer,
Hermann, Mo.

148 Chicks From 150 Eggs

Osceola, Mo.
I surely praise the Sure Hatch incubators. I have a 150 egg size. The first setting I put in 152 eggs and broke two the first week which left only 150 at hatching time. I got 148 chicks and never tested the eggs. We surely have had fine luck with our machine the past two years. Would not sell it and be without it for any money. My neighbors have other incubators and I beat them all. NELLIE GARDNER

Frank Hammond
President

Women and children find it easy to succeed with the Sure Hatch Incubator

We can give you the names of tens of thousands who make a handsome, steady income with very little effort, and would not bother with hens or with any other incubator. The

Sure Hatch

Is Automatic in Operation

Any one can succeed with it, even if they have never seen an incubator before. It is a plain, simple, strong machine, so built that it can't go wrong. Will hatch in cold weather when others fail. We send with each machine complete instructions for operating that are very easily followed.

We guarantee it 10 years and send it to you freight paid, on 60 days trial. Satisfy yourself by actual test that it is a quality machine in every respect. Your money back promptly if it is not all we claim for it.

Poultry turns kitchen waste and other farm waste into ready money; and you can depend upon the Sure Hatch to bring you the chicks at the time of year you want to hatch them to get the best price for them.

Write for our Free Illustrated Catalog, giving full information on Sure Hatch Incubators and Brooders, with much valuable information about poultry.

SURE HATCH INCUBATOR CO., Box 49, Fremont, Neb.

Our **Uncle Sam Poultry Book** will help you to succeed. It tells all about how to handle the business the best way. It is a compilation of official reports by U. S. Government experts. Tells what to do and what not to do. Many illustrations. Free with every **Sure Hatch.**

Build a Chicken Income

The first step is to get in touch with the Johnsons, who have pointed the way to 580,000 others. Let me send you the book and show you how you can start with a small outlay and get a good big income coming your way.

Old Trusty

provides an assured income with big average hatches the whole year around. Write for low price made by big output this year. We pay freight East of Rockies—give 30 to 90 days' trial—10 year guarantee.

SOME BABY CHICK TROUBLES.

This is the time of year for "Baby Chicks." There are very few sights which cause one's face to light with smiles more than to see a brood of nice, fluffy, thrifty, little chickens. Too often the scene changes in four or five days, and the hopes of the owners are blighted for the little chickens grow sick and weak, finally dying, and the owner cannot locate the trouble. Many causes of trouble with baby chicks may be traced to one of three sources, namely, heat (too much or not enough), feeds, or crowding.

While the chick was yet in the shell the egg may have been heated to such an extent that the yolk was hardened till it could not be used by the chick, yet the heat was not great enough to kill the chick. Chicks in this condition look strong and healthy for a few days, but soon get sick and die. This condition is found with chickens hatched in incubators only as the hen's temperature does not get high enough to cause this trouble.

After the chicks hatch, the mistake is often made of keeping them too warm, which has a tendency to weaken them. The best brooders are arranged so the chicks can find the temperature they like.

Letting the chicks get chilled is just as injurious.

The second cause for losses among baby chicks is the feed. Just before the chick is hatched it takes the yolk into its body. This is a little lunch basket given to the chick by nature to supply it with food till it learns how to eat after it comes out into the big world. Much has been said about feeding baby chicks as to what, when, and how to feed. Some people seem to think that because a little chick is picking at everything it sees that it is hungry, so they feed it at once. The little chick is a new creature in a strange land investigating through curiosity and is not really hungry. Other people know that the chick has the yolk inside its body and that it contains food enough to last the chick for several days so do not feed it for three or four days.

These are the extremes and may either of them do injury to the chick. To feed as soon as hatched would gorge the digestive system with too much food, and to wait four or five days, the labor required of the digestive system would be too great for its strength.

The better plan is to begin feeding small quantities of food at from 24 to 48 hours and increase the feed as the yolk decreases. Nature does not like abrupt changes. Hard boiled eggs ground fine, shell and all, mixed with bread crumbs are good for the first two days, then change gradually to rolled oats and wheat bran. After the chicks are five or six days old feed a mash composed of equal parts wheat bran, rolled oats, shorts, corn meal and to each 100 pounds, add one-half pound fine table salt and two pounds of fine charcoal.

In the afternoon moisten enough of the dry mash with sour milk or buttermilk that it will take the chickens twenty or thirty minutes to clean it up. Do not mix so much feed that some will be left to spoil.

Begin gradually to feed a good grade of scratch feed, feeding but very little at first. Keep grit before them all the time. It is a good practive to give a few drops of sour milk or buttermilk to the chick as soon as it hatches. It helps to control diarrhea. Keep either a good grade of sour or buttermilk or water before the chicks at all times.

The third cause for trouble is crowding. A chicken cannot sweat like many animals do, for they have no sweat glands in the skin, therefore much of the impurities and moisture must be carried out through the breath. If the chickens are crowded without proper ventilation, the air becomes laden with moisture and impurities so that the air cannot do the work it should. This places an unusual strain on the kidneys, which results in a weakened system. The chickens come out in the morning weak and tottery with little or no appetite. This is often responsible for the weak, low vitality birds after they get older.

If a chick is properly hatched, fed and cared for, there are very few diseases which will affect it.

The Missouri Contest

The contest is moving along nicely with all pens doing good work.

Considering the breeds by adding all varieties together in each breed during the past four months of December, January and November and February, the Leghorns averaged about 33 eggs each; Plymouth Rocks, 40; Campines, 33; Orpingtons, 39; Missouri White Fluffs, 28; Rhode Island Reds, 30; Anconas, 30; Langshans, 33; Black Minorcas, 37; and Wyandottes, 42.

Of the ten highest pens for the four months there are four Plymouth Rock pens, two Wyandottes, two Leghorns, one Orpington, and One Rhode Island Red. They are as follows:

Pen No.		No. Eggs
26.	Buff Wyandottes	277
34.	Barred Plymouth Rocks	269
40.	Barred Plymouth Rocks	266
4.	S. C. White Leghorns	262
38.	White Plymouth Rocks	260
47.	Buff Orpingtons	256
24.	White Wyandottes	255
14.	S. C. White Leghorns	249
36.	Buff Plymouth Rocks	245
35.	S. C. Reds	237

SOME DON'TS

Don't keep foul, dirty, ill-kept poultry houses and nests.

Don't keep hens that lay but two or three months of the year.

Don't keep doping for prevention of disease.

Don't allow dark and insufficiently lighted hen houses.

Dont' corn feed and fatten laying stock.

Don't keep hens too long before replacing with pullets.

Don't forget that you can hatch both early and late.

Don't fail to provide wind breaks for cold north winds.

Don't fail to provide some green stuff for winter feed.

Don't think it requires capital to start with.

—Mrs. M. M. Johnson, Clay Center, Neb.

A Hardwood Post and a Tight Staple Can't Bother *This* "Puller"

Here is the handiest little tool a farmer can have in his "kit"—a combined staple puller, driver, wire puller, splicer and bolt grip. Forged from highest grade crucible steel and oil tempered. Takes hold of a deeply driven staple with a bull dog grip, and pulls it easily. You can't imagine what a time-saver and bother-killer this

KEEN KUTTER Staple Puller

is about the farm until you try it. Like all other Keen Kutter farm tools, it is fully guaranteed. If you find a defect of temper, adjustment or balance in a Keen Kutter hoe, rake, scythe, fork, shovel, axe, spade or corn knife, your dealer is authorized to refund the purchase price. The same broad guarantee covers the Keen Kutter line of carpentry tools, pocket knives, razors, shears and table cutlery.

Send for our Home Furniture Design Booklet No. BI 976.

HOW THE KNOX COUNTY FARM BUREAU WAS ORGANIZED

(Continued from page 2)

City Fair, famed throughout Northeast Missouri. When we were about two miles from the city we were met by the Boosters of that thriving city. They were with numerous cars and with colors flying and amid Booster shouts we were led to a beautiful church where we had a most delightful meeting. Every citizen seemed to be happy to have us there and we were surely glad we were there. In the afternoon and evening we were at Edina where fully five thousand people assembled. The Edina Ladies' Band rendered beautiful music and the speaking by out of town people was very entertaining. About ten o'clock in the evening the tired people began to go home, each one seeming to feel they were glad they were living and especially glad they were Boosters and that they lived in Knox County, the county that is the center of farm values of the United States of America and that has the most fertile upland of any county in the state.

The Booster movement was held during the worst drought that has ever been experienced in Knox County, less than four inches of rain having fallen from the first of May till the third week in August. But it seemed that even Mother Nature had caught the fever, for not many hours after the Boosters had dispersed the thunders rolled and the parched earth got such a soaking as it had not had for two seasons. For three weeks it rained.

Following up the Booster movement the Edina Commercial Club appointed a committee of three to organize a Knox County Farm Bureau. The committee was composed of the writer, Mr. S. E. Botsford and Mr. E. E. Nance. The next things, as the boy said, was something else. Organizing a county seemed no small task. But with confidence in our fellowmen we started. Our first meeting we called at Plevna, in Bourbon township. We had announced through the people of the township and the schools that we would hold a Farm Bureau meeting and invited all to come. We were much pleased to find a church full of men and women. I wish to state right here, that the way in which the churches of this county were thrown open to us was very gratifying, and is conclusive to the writer's mind that the management of the different churches are striving to do all the good in this world they can.

After stating the object of the meeting, the chairman asked the people to place in nomination a man for president of the Plevna Farm Bureau, stating that it would be a local branch of the Knox County farm Bureau, that would be organized when all the townships had been organized. Mr. Lafe Hunt, a prosperous farmer was nominated and elected. Mr. Hunt has the honor of being the first president of a Farm Bureau in Knox County. A secretary and treasurer was then elected. The newly elected President was then called upon to appoint a membership committee of four to take petitions to be signed, petitioning for a Farm Adviser. We used the form as prepared by the State of Missouri. The committee having had one hundred printed for such use. The newly appointed committee canvassed the house for signers and got, I believe, about twenty signers. The wisdom of the appointment of the committee on membership by the President is self evident that Mr. Hunt knew his men, for Plevna brought in about sixty names on their first set of petitions and later there was another organization made in the same township, at Hedge, and it too has a good membership.

All the townships in the county were organized in this manner, some of the townships having two organizations. When all the townships had been covered, the committee reported to the Edina Commercial Club the results of the work with an estimate of the membership, and reported the committee ready to organize the Knox County Farm Bureau. The committee was given full power to act and complete the organization.

The chairman of the committee then requested the Commercial Club to appoint committees on entertainment, to entertain the members of the Farm Bureau on the day of organization. January 30th was set for the day of organization. All committees had their work completed and ready on time. A program was prepared for the day as follows. Eleven a. m. to one p. m., free dinner to every farmer who would come, this included his family. In fact every person in the county was invited. One p. m., band concert by Edina Ladies Band. Two p. m., address by Prof. D. H. Doane, followed by organization of the Knox County Farm Bureau. After organization of the bureau, address by Dr. Gingery of Columbia.

The day came with one of the worst storms of the winter, sleet and rain all day, but in spite of the weather and bad roads, over seven hundred were fed by the refreshment committee. The program was carried out without a hitch and every one felt that the affair had been a decided success.

The ladies of St. Ann's Society and the Ladies of the Edina Civic League served the dinner, donating their services and many of the good things to eat. The serving was done in a most elegant manner and every one was delighted with the service.

The committee never could have done the work without the untiring efforts of the people of Edina and are under lasting obligations for the loyal support, so willingly tendered.

The citizens of Edina raised a subscription of over $650 in support of the Farm Bureau.

Now that the Farm Bureau was a reality, the committee, in company with many farmers and citizens of Edina, every banker in Edina being present, went before the Knox County Court and asked for an appropriation of $4500 to pay one half the salary of a farm adviser for Knox County for three years. The request was granted and the order made. The order of the Court together with all petitions and reports of committees, minutes of meeting of organization, copy of Constitution and By-laws, names of officers, etc., were then sent to Professor D. H. Doane at Columbia with a request that a Farm Adviser be employed in accordance with the Farm Adviser Law.

The Knox County Farm Bureau expects to free the county from hog cholera, to establish harmony and cooperation between farmers and the town's people of the county, to advance community interests, to assist in keeping the farm boys and girls on the farm, by helping them to make farm life more enjoyable, and at the same time to make farm work more profitable. We expect the merchants of the county to assist us in marketing our produce to advantage to us and at the same time make for themselves a fair profit. We expect to foster the dairy industry, establish creameries within the county. We expect also to induce canning factories to locate in the county, that the produce market may be improved. We expect to assist in the betterment of rural schools and help any industry that is right. In fact the field is like the old song we used to sing,

There's a wideness in God's mercy,
Like the wideness of the sea.

Dr. E. H. Bullock,
President Knox County Farm Bureau,
Edina, Mo.

PRACTICAL FARM PAPERS—No. 7.

I have often said and written that I believe that we here in the Ohio Valley have the best plowmen in America, good work being the almost unvarying rule. It is just as easy to do a good smooth job of plowing, as a slouchy, rough one, leaving the plowed land all over "cut and cover," "dog beds," half turned sod and trash on top. By far the greater part of our work is done on two-year-old timothy-clover sod, and with a fourteen-inch walking plow and two horses, yet the sixteen-inch sulky, drawn by three horses, is coming into use pretty rapidly in the past few years.

As to depth of breaking land for the main farm crops, I supopse that I am not orthodox in my belief, as I hold to the doctrine that I would rather chance a crop on land broken two inches deep, that two inches thoroughly pulverized to the very bottom of the furrow, than on land broken eight inches deep and not well prepared. Now when I write of two-inch plowing and eight-inch plowing, I am going to both extremes as to depth, two inches being too shallow to admit of a good job of plowing, and —here I will meet with dispute—eight inches being deeper than one farmer in 100 ever plows.

It is safe to lay down a general rule, that no spring breaking should ever be deeper than it is possible to thoroughly pulverize before planting, and as I have never found an implement that will do good work at a greater depth than six inches, actual measurements, that is about the depth that I would call good plowing, as six inches by guess, is usually about four inches by measure.

Although my farm is a heavy clay loam, it is well filled with humus, and up to April 15, the date when we are apt to get our last mellowing frosts, I pay little attention to the oft repeated advice, "Do not plow your land too wet," and I have never observed any ill results from such practice. We have but four or five acres that would possibly be improved by under drainage, and those spots are in three fields, where I have plowed many a day when the water followed the plow all through these spots.

It is our rule to harrow each half days plowing done after April 15, before we leave the field, and we seldom break this rule but that we regret it before the season ends.

Last year, owing to a combination of troubles, we did not get to breaking on ten-acres in a field until May 5, and we rushed through without harrowing as we plowed. This ten acres made several bushels less corn per acre than the five-acre section of the same field, broken early, but not as good soil.

Some ten years or more ago, I was

compelled to turn some young horses in a field next a barb wire fence, and for security plowed a ten-furrow strip along this fence. This was about August 1, and the next April when I went to break the field I did not replow this strip, simply discing it four or five inches deep just ahead of planting. It was a very dry season, and this strip of three rows of corn made 25 per cent more corn than any other three rows in the field. I have also had excellent crop results from simply disking corn stubble before planting, and am going to practice this plan this year on three acres of land where I expect to grow near 100 bushels per acre, as I did this year. C. D. Lyon.

BUCKSHOT BY THE PROFESSOR

Hound dogs seem to be popular with the present Legislature—at least more so than sheep.

If some fellows were to put in an hour of real hard thinking it would put them in bed for a week.

Many a man's chance of going to heaven has been lessened by trying to scour rusty plows and cultivators.

The fellow who says "I am taking "too many farm papers" is usually a fellow who doesn't get any good out of any of them.

Taking into consideration the kind of fellow some mules have to work for, it isn't any wonder they kick at things on general principles.

There is still time to get that wood pile in shape so the good housewife won't have to run around in the boiling sun all over the farm next summer.

Show me a man who is popular in his own family and I'll show you a man who has a pile of good in him and who is a tolerably good kind of a citizen.

Looks to me like Wilson is getting ready to get mad about that Mexican muss. If he ever does I'll bet a lot of "greasers" will be jumping into the Gulf of Mexico.

Are you really giving that boy of yours a "square deal?" Are you trying to make a friend and companion out of him? Do you pat him on the back once in a while and compliment him when he deserves it?

How about your seed corn? Are you going to plant some that will insure a stand of vigorous corn—or are you one of the kind who goes to the corn crib in the eleventh hour and picks "good lookin' ears?"

Old "Josh" Simpson says it's not as much fun to live now-a-days as it used to be. For instance, he says that dry goods boxes these days are made out of wood that's so tough that it "won't whittle worth a durn."

I heard a robin red breast the other morning—and it reminded me that in a few weeks from now the violets will be peeping out of the ground and that the whole World will once more receive its greatest promise of a resurrection.

There's mighty little excuse for the average farmer having to buy feed even in a bad crop year. Let's see if we can't at least raise enough this year—regardless of the season—so we won't have to tell the banker a hard luck story next winter. Just a little bit better farming than we did last year will turn the trick.

A BIG CROP IN 1915

Let's square away for a big crop in 1915. What do you say? Out of the last four crop years, three have been poor ones. The last big corn crop we had was in 1912—and outside of a couple of good wheat crops in most sections, it has been pretty slim picking. It's a long road that has no turn—and we've got a hunch that 1915 is going to be a hummer. In the meantime, let's do our part. Let's get on the job and stay on it as never before—and let's be sure we start in with the right kind of tools and implements. To this end, we want to call your specific attention to a number of things advertised in this issue of The Missouri Farmer—for they are all designed to make your farm labor more profitable and less irksome. A postal card will bring you the literature by return mail from all of these manufacturers—and it will give you a good sized library of the latest farm information.

Of course we want this to be a great corn year for corn is Missouri's greatest crop. You will find several improved corn planters described in this issue and if you are not using a good planter, ask for the literature. A poor corn planter will lose more in one season than a good one will cost.

The average farmer doesn't pay enough attention to preparing his seed bed—and to this end, he needs up-to-date plows. You will find several of the latest makes advertised in this issue and the literature describing them will give you a world of mighty important information about seed bed preparation in general. It will make an interesting evening's reading.

Then there is the manure spreader question—an indispensable implement in the fight for better soil fertility and a tool which every wide-awake farmer should own. You will find several good ones advertised in this issue.

If you are going to need any woven wire look up the concerns which are offering dependable goods in The Missouri Farmer. A certain concern is putting out a steel fence post that seems to supply a long-felt want.

The Aermotor Co. of Chicago is offering a new low-priced windmill which should interest every farmer. This mill is said to require less wind than any other kind on the market and can be fastened onto any kind of a tower. Every farmer needs running water in the barnyard—and at little cost it can be piped into the garden or house. A windmill adds dignity to any farm and we suggest that you write for the literature. Information never hurts anybody.

The J. D. Tower Co. of Mendota, Ill., has a new corn cultivator worth studying. The Janesville Machine Co. of Janesville, Wis., also has a line of up-to-date cultivating implements worth looking into.

For $7.50 you can buy a clipping machine from the Chicago Flexible Shaft Co.—and all your work horses and mules should have a "hair cut" before you commence the spring work. They will do more and better work and be less subject to harness galls. This machine will last for years and will pay for itself on the first span of horses or mules you sell because they will bring a better price when they are neatly clipped.

Are you using a cream separator? A good one will pay for itself in a little while in the amount of labor it saves. It is a question you ought to investigate if you are not familiar with it. You will find several good ones advertised in this issue.

Undoubtedly there is a greater interest in poultry this year than ever before—evidenced by the flood of inquiries we have had about incubators and you will find several of the best on the market described elsewhere. If you haven't got a good incubator, buy one. It will save its cost in the first two or three hatches. Why not make some money out of poultry this year?

Undoubtedly Missouri will build hundreds of silos this year because farmer after farmer has demonstrated that a good one will pay for itself the first year. The Dickey Clay Mfg. Co., 202 New York Life Bldg., Kansas City, Mo., is putting out a new tile silo which is attracting a great deal of attention. The Woods Bros. Co. of Lincoln, Neb., are also putting out a good stave silo.

A new idea for hog raisers which seems destined for a reign of popularity is the Hog Oiler—a device which contains medicated oil that kills lice and otherwise disinfects the skin of the hog. The hog soon learns to rub himself on this "oiler" and thus keeps himself free from vermin. If interested, write to the Rowe Mfg. Co., 103 Liberty St., Galesburg, Ill. When writing to advertisers always mention The Missouri Farmer.

Make Your Hens Lay

The S. R. Feil Co., Dept. 17, Cleveland, Ohio, are out with a new poultry tonic which is said to be one of the best preparations for making hens lay ever put on the market—and they will gladly send our readers a free sample. They will also send you free their poultry book entitled "Lots of Eggs—How to Get 'Em." Just drop them a postal card and ask them to send you a free sample of poultry tonic and the book. Be sure to mention The Missouri Farmer.

International Harvester Cream Separators

"AFTER you put in a cream separator and once experience the relief it gives and the work it saves, you will never go back to the old way of handling milk and cream." So says a farmer's wife who has managed a farm dairy for over twenty years, and who now has an I H C cream separator.

I H C cream separators—Dairymaid, Lily or Primrose—fill the bill completely. They turn easily. They skim closely—leaving barely a drop of cream in a gallon of milk. They need few adjustments and none that a farmer or his wife cannot easily make. They have the large, low supply can; the strong frame with open sanitary base; the quiet, easy-running gears oiled by an efficient splash system; and the clean, classy appearance which make I H C separators such favorites wherever they are used. There is room for a 10-gallon can under the milk spout.

I H C separators can be furnished with pulley equipment for the use of power. Belted to a small I H C engine, or to a line shaft, they give you the very best cream separating outfit it is possible to buy.

The cream separator that gives you the most cream, saves you the most work and lasts the longest time. See the I H C local dealer who handles either Dairymaid, Lily or Primrose cream separators, or write to us for full information.

Build Today the World's Best Silo —Pay Next Fall

THIS is the most liberal and convincing silo proposition ever made. We make this offer to prove to you, first, our supreme faith in the Dickey Silo, made of vitrified clay tile, "tight as a jug." And secondly we can better afford to send you this silo now, so that you can have it up and ready for use when silage time comes, rather than stack the tile up in our yards waiting for your order later in the year.

So buy a Dickey Silo now, and pay for it September 1, 1915. Without a dollar down, you can have the Silo that lasts a life-time, the Silo that rids you forever of all silo troubles, and annoyances, and up-keep expense. The time price today is the same as the cash price in September—dollar for dollar.

Dickey Glazed-Tile Silo

"Tight as a Jug"

The Dickey Silo is built once only. It cannot blow down, warp, twist, crack, crumble, or decay. Never needs painting. The glazed, vitrified hollow tile, reinforced by bands of steel laid in the mortar, are guaranteed to withstand many times the pressure of any ensilage you can pack into the silo, protect fully from frost, and absorb no moisture. It's built "for keeps"—which is true economy.

NOTE—We want first class men, Stockmen, Farmers, Dairymen, to act as agents of the Dickey Silo in their localities—men who enjoy a wide acquaintance and the respect of their neighbors.

Send the coupon, or a postal for our liberal proposition. Ask for catalog H

W. S. Dickey Clay Manufacturing Co.
202 New York Life Building, Kansas City, Mo.

W. S. Dickey Clay Mfg. Company, Kansas City, Mo.

Please send catalogue H particulars regarding your Proposition to sell a Dickey Silo on 5 months' time. I am thinking of erecting a silo ....size.

Mrs. F. B. Mumford, Columbia.
Mrs. R. E. Shryock, Kansas City.
Mrs. J. E. Roberts, Maysville.

A CLUB AT MARCELINE

The Rural Home Circle was organized in March, 1910, and now has a membership of thirty. It stands frankly and openly for sociability and recreation, has never attempted any work or study. It meets once a month at the home of a member; a short program of music, vocal and instrumental, a paper, a reading or perchance a story, a short business session, a delicious lunch and social chat fills the program. The members all live within three miles of Marceline, where most of them attend church and the children attend school, so that the call for community work along these lines does not seem very urgent.

These busy farmer's wives found themselves growing apart, they were better acquainted with the church and lodge people in town than they were with the neighbors a mile away; they needed a common interest, they were tired and needed recreation. The Rural Home Circle has answered their needs most acceptably.

It is nice to deck out the home in its very best and to vie with the other members in dainty service and delicate cookery. Then in mid-summer there is the annual picnic, with the families along, frying chicken, popping corn, roasting potatoes over the big camp-fire and inhaling the aroma of coffee.

During the mid-winter there is the banquet—a real banquet from shaded lights to an elaborate menu, soft music, and an excellent program.

We feel that our circle has been well worth while.

Mrs. W. C. Patrick, Sec.
Woodland Place Marceline, Mo.

Every pleasure and relaxation that comes into the mother's life is relived and shared with her family, and it will be safe to predict that the girls and boys of the Rural Home Circle community will not drift to the city for their pleasures nor lack interest in the old farm home.

Your report next, please, we feel that through these we are learning to know our farm women and more of their home interests.

IMPROVEMENT LEAGUE OF JACKSON TOWNSHIP, JOHNSON COUNTY

I have endeavored as a member of and a delegate from the Jackson Township Improvement Club of Johnson County to explain to you as nearly as I can that which we have accomplished during the past year..

Our club was organized early in 1913 for the purpose primarily of improving our community socially. I think this an important work which each school district, as well as township, should endeavor and strive to accomplish. I long for the time to come when each township shall have this kind of an organization and hope that you will all join me in this wish for our country's improvement from a social standpoint. In our township league are four minor leagues, which are the improvement leagues of four districts of Jackson township, namely Fairview, Pittsville, Lone Walnut and Elm.

The Township League meets on the Monday after the second Sunday every three months, at the Elm High School building, which is situated in the center of the township. This rural high school, which was spoken of last year in this connection, as doing excellent work, especially for its first year, is doing even better work this year.

The four free trips offered by the county to Farmers' Week in the stock judging contest were won by four boys from this rural high school. One of the boys also won first place in judging corn in the county and one of the girls won a scholarship in the Warrensburg Normal in a dressmaking contest. She also won first place on an essay contest, entitled "Pure Bred Poultry and Why Better than a Mixed Lot."

The district leagues generally meet at the homes of the members in an alphabetic order or at the district school house. They meet every two weeks or every month according to agreement of the members. The district leagues do not all have the same rules and by-laws. However, they are all similar.

The Township Leagues used fifty per cent of its funds as premiums in the domestic science line at the Jackson Township Fair, which was held at Elm, Oct. 14, 1914. Several of the districts offered premiums as a club and others were offered by individuals. This is an annual affair which we are eager to see progress, because it stirs ambition and love for rural life and helps us to be able to have a show-up in the county.

At one of our township meetings last year, our president, Mrs. Ivan W. Phillips, asked that each of the district clubs prepare one program each to be rendered at the meetings for the coming year. I will here state three of them, omitting the other because it has not yet been handed to the president:

(1) Play grounds, care of, by children; agriculture and what might be accomplished by its teaching in the country school. Home Economics and Manual Training; how far practical in the public building.

(2) Helpful suggestions for the comfort and convenience of school grounds, and as to school lunches.

(3) Diversions of farm women and especially the basket dinner. There were arrangements made for special music also.

Three of the district leagues held home economics schools in 1913. However, the Pittsville League was the only league which held one the past year. The school this year was conducted by Miss Rose from the University of Missouri.

The Pittsville Improvement Club organized a tomato club this year, having eight members. Their object was to see which could clear the most money off of one-tenth acre of land put to tomatoes. As the season was so unfavorable, only two girls were successful in raising enough tomatoes to can. One of the girls cleared twenty-one dollars and thirty cents ($21.30) while the other cleared forty-nine dollars and ninety-five cents ($49.95).

Several of the district clubs organized sewing societies for the girls. Most of these prove to be very beneficial. Teachers were appointed to teach the children according to their ages. Embroidering, crocheting and plain sewing were taught. These sewing societies meet once a week at the homes of the members.

The Fairview Improvement Club gave an entertainment on the night of July 3, 1914. From this we realized the sum of twenty-five dollars. If the night had been favorable, we would probably have gained more. The weather was threatening and the play was given in the grove on H. W. Phillips & Son's farm.

Ruth Ballard.

Wanted—Farmers!

Mayes County, Oklahoma, wants more farmers; good farmers to take advantage of her splendid opportunities.

Located in Northeastern Oklahoma, Mayes County produces corn, wheat, oats; dairy products; live stock. Has 40 inch rainfall. Good plow land, $20.00 to $50.00 per acre; pasture and hay land $2.00 up. Good schools. Trunk line railroad; low taxes. Write for up-to-date booklet, descriptive of the square deal proposition of the Mayes County Farm Bureau.

Special homeseeker's fares to Oklahoma on First & Third Tuesdays of each month.

Colonization Dept, M. K. & T. Ry., 1546 Railway Exchange Bldg, St. Louis, Mo.

THE MKT

The cheer-up wind of jimmy pipe joy

Copyright 1915 R. J. Reynolds Tobacco Co.

It sure comes to real men mighty quick when they get on the trail of Prince Albert—pipe and cigarette makin's tobacco that *never did* and *never will* bite tongues or parch throats.

That's because it's friendly-like; because it's manufactured by an exclusive patented process that cuts out the bite and the scorch and just makes men so all-fired happy they can hear the pollywogs purr even before the pussy willows peep into the spring sunshine.

PRINCE ALBERT
the national joy smoke

is particularly for men who smoke and for men who want to smoke and have found heretofore they couldn't. So take this invitation and come on around and get acquainted with Prince Albert in the tidy red tin. Let real pipe and cigarette happiness break right into your life.

Get started on the tidy red tin, then you'll graduate to the crystal-glass pound humidor with the sponge in the top that keeps your P. A. fine and pipe-fit all the time.

Prince Albert is sold everywhere. Toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors; crystal-glass pound humidors.

R. J. REYNOLDS TOBACCO CO., Winston-Salem, N. C.

Cold Frames.

Most cold frames are similar to those used everywhere by gardeners, with the slope to the south; the north side is boarded up to a height of 18 inches, and the south is simply a 12 inch board stood on edge; both sides are braced by posts set in ground at distance of six to eight feet. One can make it as long as desirable with the ends tightly boarded up.

The sash is usually the standard size, 3x6, rafters between the sash are very useful in saving labor, and a woman can the more easily pull it down from the top for ventilation and not have to lift off entirely; it also saves or prevents the sash from sagging in the middle.

It is well not to put the sash on until the bed is finished.

It requires three inches of finely turned stable manure well packed down and perfectly level in the bottom of the frame, after which, two inches of good soil is put on top of the manure, taking care to keep it also perfectly level, complete with rafters and sash and all is ready for plants.

If the tomato seed were drilled thinly in the house box, they will probably not crowd nor grow too spindling, thus they can hold until about March 20th-25th, when, if the weather permits, they should be transplanted into either old strawberry boxes or four-inch pots—possibly paper pots; some plant directly into the bed, placing plants 4 inches apart.

Set the pots or boxes as closely together as possible and sink them down well into the bed.

These plants will call for attention during their stay in the cold frame, they are to be kept warm, watered and ventilated according to the weather; the sashes need to be covered every cold night to prevent loss of heat or the frost getting into the plants.

Much is said in favor of the patent double glass sash, which saves much extra care and no covering.

The plants by the time of transplanting to the open garden in May should have thick stems with little side branches starting at leaf joints with buds forming or the crown setting and beginning to open.

Home Canning.

"What will be the effect of home canning?" was a question put to several members of the National Canners' Convention, which met recently in New York—a body of 7000 men.

"We rather encourage the policy," they agreed.

"We want the farmer's wife to know the value of canned goods in her household program. She can put up many of her products, such as her berries and tomatoes in cans, and do it well. She may some years have a shortage of this or that, and she will naturally turn to the commercial product.

"I believe the outlook is encouraging and instructive, particularly to the farmer's wife, and it will develop an interest in our work and our product."

"THE ROBIN"

I heard a song this morning
That thrilled me with delight;
The singer, the first spring robin,
A cheerful, pretty sight.

And I wondered where he wintered,
How many miles away;
What other lands he gladdened,
With his blithesome roundelay?

And glad I was he hastened
Back home, when snows are o'er,
And perched upon the old elm tree
Outside my cottage door.

He's true, and always busy,
And working all day long
To make the old world better
And brighter by his song.

T. K. E.

BLACK STRAP MOLASSES

I have read the article by Mr. J. P. Maurer of Nodaway County on silage and note that he has been feeding black strap molasses with silage. I bought a car of black strap molasses last month, 64 barrels, and thought we might benefit by exchanging notes as to the best place to buy it and as to the best methods of feeding it, and results obtained, if you will put me in touch with Mr. Maurer. I am feeding a bunch of mules on silage and molasses, but we have been pouring the molasses over the silage without diluting. It seems to mix fairly well but we have not had any very cold weather since we began to feed it. I am also feeding it to hogs by pouring it over some shelled corn and stirring it up, then adding some bran and shorts. On one bunch we noticed that after feeding this bunch a few days on this feed, the shotes passed a large number of worms. I am not sure, however, that the molasses caused the removal of the worms. Have you fed any molasses to your hogs and have you noticed the passage of any worms?

I bought my molasses in St. Louis, the car was shipped direct from New Orleans. It cost 8 cents a gallon on track and the freight rate was 30 cents a hundred making the cost about 12 cents a gallon, laid down. I think I can sell the barrels for enough to bring the cost to about 10 cents a gallon. This molasses is rather low grade, being only about 44 per cent sugar. I had some priced to me at 14 cents f. o. b. St. Louis and it is a better grade than what I bought but I do not think it is worth the difference, as it would cost 16½ cents here. Another lot was priced at 21 cents guaranteed at over 60 per cent sugar.

I would be glad to have any information you and others can give and if you wish will give you what results I get feeding hogs.

Earl Johnson, Carroll County.

Editor's Comment: This letter has been forwarded to Mr. Maurer and we invite both of you to give our readers through our columns the benefit of all the information you have on the subject. The Missouri Farmer is the farmer's real paper and with their continued help we can make it of greater value in every issue.

Winners in Short Course Live Stock Judging, University of Missouri. Three men in front row, reading from left to right: Mr. Milton L. Remer, Mr. G. A. Tabor, Mr. H. D. Lawler (who tied for high place in the contest). Back row, reading from left to right are: Mr. I. B. Hoberecht, winner of Brown Galloway medal; Mr. Abel Hensel, winner of Wallace Poland China medal; Mr. B. F. Vaughn, winner of Crosby Clydesdale medal. Mr. Harry S. Cunningham, winner of Walker Shropshire medal.

MIX YOUR OWN FEED

Any farmer can cut his feed bill two-thirds and get better results by a simple method of mixing molasses with roughage.

The Bliss Syrup Refining Co., of Kansas City, Mo., manufacturers of BLISS-FED, a pure molasses for feeding purposes, are giving away absolutely free an interesting booklet containing letters from farmers and telling all about this method.

Simply send name and address today for a copy of this free booklet and also their free trial offer for your own use. Write today—a postcard will do—to the BLISS SYRUP REFINING CO., 929 Hickory St., Kansas City, Mo.

For Sale, Two Guernsey Bulls. Registered, good individuals, excellent breeding. Two-year-old and six months calf. Come and see or write D. P. Daniels & Son, Vandalia, Mo. 314

STOCK and GRAIN FARM SACRIFICE

100 Acre Rich Farm Will Be Sold at $60 Per Acre

Owner is compelled to sell this highly improved 930 acre farm. Adjoins a Missouri town of 1000 population with 2 railroads. Eight hundred acres, rich,smooth, tillable land, remainder good bluegrass land. About 500 acres in corn and feed crops. Improvements, a good 10-room house, good 3-room house, good 4-room house, also 5 large, substantial barns, a 250 ton steel silo, corncrib for 10,000 bushels of corn, granary for small grain, haymow for 300 tons of loose hay. Can feed 500 head of cattle under barn roof at one time. All improvements substantial and cost and are worth now more than $25,000. Fenced into many fields and pastures, much hog tight. Abundant good water, well distributed, 300,000 tons coal, mined by strip mining, will more than return purchase price and only a small part of land be disturbed.

Also 800 acres in Lafayette county, Mo., adjoining a station. Can sell for $100 an acre. No land adjoining this or in immediate vicinity can be had for less than $150 an acre. Write for further information and terms. J. H. LIPSCOMB, 511 R. A. Long Bldg. Kansas City, Mo.

COMMERCIAL PURE CULTURE

We all realize that commercial pure cultures are finding a permannet place in agriculture. This being true, let us read what our Department of Agriculture at Washington has to say about the matter, particularly as to when artificial inoculation becomes necessary. In Bulletin No. 315 it says:

"Inoculation is desirable—

"(1) If the soil has not previously borne leguminous crops.

"(2) If the legumes previously grown on the same land were devoid of nodules.

"(3) If the legume to be sown belongs to a species not closely related to one previously grown on the same soil.

"(4) If the soil produces a weak growth of legumes, even though their roots show some nodules.

"It is significant of the relative value of pure culture inoculation that a high percentage of beneficial results is being obtained, not only where legumes new to the region are being tried, but where the ordinary legumes used in rotation have been inoculated, a phenomnon which is undoubtedly due to the increased virility of the nodule-forming bacteria resulting from the proper development of the pure cultures in the laboratory. It is also true that the crops following the inoculated legumes have in many cases shown gains not evident in the legume crop. The practice of inoculating is therefore justified when legumes are naturally inoculated but do not seem to reach their full vigor nor to give the best results as green manures."

With the above facts in mind it becomes apparent that pure culture inoculation of legumes is in most cases not only a wise precautionary measure, but a profitable investment that assures us legume crops of greater value whether we grow them for feed or for green manure.

Pure culture inoculation, like other ideas that science has given to agriculture, was a long time coming into its own. For years, in fact, the world only knew but one commercial culture and this was the original product which emanated from two well-known German scientists, Nobbe and Hiltner, of the Royal Agricultural College at Munich. (This product, now known in all farming countries as "Nitragin," encountered much adverse criticism on the start, despite the fact that Nobbe is recognized as one of the world's greatest bontanists and Hiltner was pre-eminent among bacteriologists.)

While this unfavorable criticism proved disheartening, its moral effect was doubtless good, for it impelled these scientists to put years of concentrated effort in so perfecting "Nitragin" that its critics were eventually disarmed and its place among the commercial necessities of the world firmly and permanently established. Nearly every new product must run this gauntlet of criticism and skepticism and perhaps it is a good thing; it is a crucible in which only the fittest can survive.

Today the use of "Nitragin" for inoculating the seed of alfalfa, clover, peas, beans, vetch, cowpeas and soy beans has grown into a dependable farm practice. Many other commercial pure cultures are also on the market, showing how great the demand has grown for artificial inoculation.

We should bear in mind, however, that no pure culture is a "cure all." And before we purchase our legume germs we should first make our soil sweet and our seedbed firm, fine and well settled, so that when our legume seed is inoculated (covered with the proper kind of germs) the soil will prove a favorable home, both for the germs and the seed. With these precautions observed we can make clover, alfalfa, vetch, etc., as sure a crop as wheat and corn.

Legumes we must grow. And they must be inoculated legumes; otherwise our time, labor and money are wasted. It is this vital fact that makes a dependable pure culture product such an important factor in modern agriculture today.—***

Preventing Distemper

Elsewhere in this issue is a description of Crafts Distemper Remedy—a preparation which has been on the market for over 20 years and which is absolutely guaranteed to prevent Distemper, Catarrhal Fever, Pink Eye, Colds, Epizootic, etc. A dollar bottle should be kept constantly on hand in every barn. Your money will be refunded if it fails. Drop a postal card to the Wells Medicine Co., 33 Second St., Lafayette, Ind., and ask them to send you their free "Horse Book." It may save you a big veterinary bill.

For Bigger Crops

If you are interested in commercial fertilizers, drop a line to the Empire Carbon Works, St. Louis, Mo., or to the Middle West Soil Improvement Committee, 925 Postal Telegraph Bld., Chicago, and ask them to mail you their free soil bulletins. They contain a fund of valuable information. Also write to Darling & Co., Dept. 54 Stock Yards, Chicago, and ask for their free book to farmers.

Worms Weaken Hogs

Thousands of farmers all over the Corn Belt use Salvet to eradicate the worms in their hogs. The S. R. Feil Co. of Cleveland, Ohio, will be glad to send you a quantity of this popular remedy on trial. If it doesn't do what they claim for it you don't have to pay. See advertisement on page 19 in this issue. Hogs weakened by worms become an easy prey to cholera. (Adv.)

Interested in Alfalfa

If you are interested in growing alfalfa or clover, write to Armour Fertilizer Works, Dept 62, Chicago, and ask them to send you full information about "Nitragin"—the surest way of inoculating the soil for all leguminous crops.

Feeding Blackstrap Molasses

If you are interested in feeding Blackstrap molasses or cotton seed cake or meal, write to the Chocktaw Sales Co., Live Stock Exchange, Kansas City, Mo., for prices, etc. Be sure to mention The Missouri Farmer.

STOP DISTEMPER AT THE START

(6)

Distemper and all similar head and throat diseases in horses, sheep and dogs, are caused by contagious germs. Stop the disease at the start, kill the germs with a bottle of

CRAFT'S DISTEMPER REMEDY

For 22 years Craft's has been sold on a positive guarantee to cure Distemper, Influenza, Epizootic, Pink Eye, Coughs, Colds, Shipping Fever and Catarrhal Fever, or your money refunded. Craft's is not only the **BEST**, the **SAFEST**, the **QUICKEST** and most **CERTAIN** remedy on the market, but it is also invaluable as a preventive. Even if your animals are not sick at the present time, if you are wise you will get a bottle of Craft's at once to give to your horses as a preventive. It will drive out the germs, tone the blood, re-invigorate the appetite and put your animals in a first-class healthy shape. Buy a $1.00 bottle today and safeguard your animals from disease. Small trial size bottle, 50c. Your dealer has it or can get it for you. Be sure to get the genuine. Imitations are never so good. Remember, you take no risk—**YOUR MONEY BACK** if it fails.

VALUABLE HORSE BOOK FREE

A Practical Veterinary Book. Tells how to cure all the common diseases of horses. Of value to every farmer, stockman and horseman. Write for your copy today. A postal brings it by return mail.

WELLS MEDICINE CO.
33 Second St., LAFAYETTE, IND.

Raised Without Milk!

Her name is "Daisy" and her owner, W. A. Riddle, of Chapin, Iowa, raised her on Blatchford's Calf Meal, which costs less than half as much as milk.

Blatchford's Calf Meal

An absolute preventive of scouring. Calves raised "The Blatchford Way" are heavier, bigger-boned and healthier. Known as the complete milk substitute since the year 1800. Sold by your dealer or direct from the maker.

See Actual Figures —based on results—that show you how to increase your calf profits. Write today.

Fall and winter pigs, both sexes. Quality the very best—prices the lowest. Can be registered. Order early and get the pick.
Also an extra good herd boar very cheap.
K. H. BROWN, R. F. D. 1 Bolivar, Mo.

LIVE STOCK NOTES

By R. P. Royce, Fieldman

Dean's Good Poland Offering

We want to call particular attention to the change in Clarence Dean's advertisement in this issue. Mr. Dean is now offering about forty head of bred sows and gilts of strictly big type breeding and all vaccinated with the double treatment.

Clarence Dean has a herd of big types that deserves the serious consideration of any one planning to buy. Years ago when the herd was founded, Mr. Dean went to Iowa and secured some of the best sows he could buy from such herds as Peter Mouw, Wheeler, Lawson, Fessenmyer, and others, and he has since maintained his herd on the same high level. Few breeders can show more size and quality than will be found in this herd, and when you do find it you can't buy it anywhere near the prices asked by Mr. Dean.

The forty sows and gilts referred to above are either sired by or bred to one or another of the four herd boars, Mastodon Price, a good son of the famous old A. Wonder, and out of a Chief Price dam; Gritter's Longfellow 3rd by Gritter's Longfellow, and out of a Long Price 2nd dam; A Wonder Price by Pritchett's A Wonder and out of a Longfellow dam; or to Jumbo Wonder, a grandson of Big Jumbo.

The gilts are of March and April farrow and are bred to farrow at about one year old. The dams of the lot are great big, smooth, prolific, motherly sows that would weigh from 700 to 800 pounds in full flesh. Now here is a chance to buy something good at prices that will make you money.

Mr. Dean also has a number of good young boars on hand, of the same breeding as given above, and in the lot are several outstanding good ones. Get in touch with Mr. Dean and we feel sure you will be glad to do business with him. Mention this paper.

Jasper County Dairy Association Sale

Readers of The Missouri Farmer who are interested in securing choicely bred Jersey cattle are referred to the advertisement of the Jasper County Dairy Association's first annual sale to be held at Carthage, Monday, March 29.

On this date sixty head of bulls, cows and heifers will be offered under the auspices of the above association, and so far as we know this will be the first dairy association sale to be held in the State.

Consignments to this sale are restricted to members of the association and only animals that pass the approval of the inspection committee will be offered. Every lot sells tuberculin tested.

For many years Jasper county has been forging to the front as a dairy community, and some notably good herds have been established. In recent years considerable interest has been manifested in the industry and as a consequence some of the best blood of the breed has found its way to that community and in the present sale offering will be found decendants of such sires as Noble of Oaklands and others nearly as prominent.

The sale will be held in Carthage regardless of the weather. George H. Sewall of Carthage is secretary of the association, and we take pleasure in urging those of our readers who are interested to write Mr. Sewall for the catalog. Kindly refer to this paper.

Adenhill Durocs

R. L. Hill, Columbia, Mo., wishes to call attention to a nice lot of bred gilts that he is offering the trade. These gilts were farrowed from April to June, and will weigh around 250 pounds. They are all sired by Golden Tat, a big good son of Tatarrax Again, the reserve grand champion boar at both Kansas State Fairs in 1911. The dams of the offering are Ohio Chief bred sows from prolific strains. For the most part they are bred to Bob's Col. Wonder by Col. Wonder 2nd, a prize winning son of the grand champion boar, Col Wonder, and a litter mate to Belle of Missouri 3rd, the grand champion sow at Sedalia last year. They were bred January 7th to February 4th. Mr. Hill advises us that he is pricing the lot extremely low in order that he may dispose of them as soon as possible.

He also offers an exceptionally good lot of fall boars and gilts sired by Col. Wonder 2nd. Pairs and trios not related can be furnished if the order is received soon. Kindly mention this paper in writing.

60 Head of Registered Jersey Cattle
To Be Sold at Public Sale
AT
Carthage, Mo., Monday, March 29, 1915
Unedr auspices of the Jasper County Dairy Association. Only members are consignors. (First Association sale of dairy cattle held in the State)
The offering is a choice one, representing superior cattle and some of the best herds in the county. All cattle tuberculin tested. Only cattle approved by Association Committee are offered.
Send for catalog.
George H. Sewall, Secretary, Carthage, Missouri

See or write CLARENCE DEAN, Weston, Mo.
P. O. Weston, Railroad Station, New Market. Electric line from St. Joseph and Kansas City. Station Dearborn, Mo.

Angus Bargains

Beginning with this issue Mr. J. M. Jones, of Everton, Mo., a prominent Angus breeder of Southwest Missouri, calls attention to the fact that he is in a position to offer the readers of this paper some very meritorious young bulls and heifers.

Mr. Jones started his herd about 1902 by the purchase of a select lot of cows from the herds of such prominent breeders as Hugh Elliott, W. W. Andrews, W. J. Turpin and Berry Lucas.

Most of the popular families are represented in his Prairie View herd and the young stock he is now offering are for the most part the get of the double Blackbird Bull, Laddie Blackbird 142245. This good bull has proved very useful in Mr. Jones' herd, but he finds that it will no longer be practical to retain him inasmuch as he plans to keep a goodly number of his daughters in the breeding herd. Laddie Blackbird is, therefore, for sale, and Mr. Jones is prepared to make a real bargain price on him. This bull was bred by W. W. Andrews, Maryville, Mo., and was purchased at the association sale held at the American Royal in 1911. It might be added that this bull topped the sale.

We have visited this herd in the past and feel sure that the class of cattle Mr. Jones is producing will meet with ready appreciation from farmers who are desirous of improving their herds. Any of our readers who may be interested are urged to write Mr. Jones, and we will appreciate having you mention The Missouri Farmer.

Smith Bros. Durocs

W. O. & B. A. Smith, Thompson, Mo., are again advertising their Durocs in this paper. At this time Messrs. Smith are making an especially attractive offer on fall boars sired by Beauty's Model, the first prize senior yearling boar at the recent Missouri State Fair. These pigs are growthy and smooth and possess the desired easy feeding qualities. The Smith brothers are making a very sincere effort to build up one of the real high-class herds of this state and they feel that this lot of fall pigs marks a big step forward for them. The prices on these Beauty's Model boars is $25 delivered anywhere in Missouri. If you need a boar at this time we would suggest that you drop this firm a postal at once. Kindly refer to this paper.

JERSEY CATTLE

Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

WILL G. LOCKRIDGE - - - - - - - Fayette, Mo.

Safeguard YOUR Stock—Rid Them of Disease-Breeding Worms

You can't expect big profits and big prices for your stock unless they are kept in the pink of condition. And you cannot put them in good condition unless they are free from worms. Worms cause 90 per cent of all stock losses—**they keep your animals in a run-down, unthrifty condition**—sap the vitality—consume the food you feed your stock—derange their digestion and make them easy prey to fatal diseases. The best of care and feed will not put fat on a wormy animal, nor prevent disease. In their wild state all animals instinctively sought roots, herbs and barks that kept them healthy. **Domestic animals require a worm destroyer and conditioner to keep them healthy:**

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Worm Destroyer and Live Stock Conditioner

—is a "Safety First" preparation. It's mission is to rid stock of dangerous disease-breeding worms. It cleans out these destructive pests—corrects indigestion—puts new life, vigor and strength into animals, enabling them to throw off disease. In short, it is a wonderful preventive as well as profit producer. No dosing—no drenching—no trouble to feed. SAL-VET is a medicated salt—not a food. Has no food value. It is a remarkable tonic and conditioner. Read the following letters:

"I have been feeding SAL-VET to my hogs, and they passed a lot of worms. When I butchered some of the hogs, I could not find a single worm, nor a sign of a worm in any of them. My neighbors lost all of the hogs they had, but I have not lost a single one."
—John Sauer, Fort Wayne, Indiana

"The seven head of horses to which I have been feeding SAL-VET are now feeling fine, and look as sleek as a bunch of ground moles. Have also feed it to my pigs, and every one on the place has his tail tightly curled and is always ready for his feed."—Samuel Brice, Prop. Walker Stock Yards, Rt. No. 13, Grand Rapid, Michigan.

"SAL-VET did the work. I think it is the best tonic and worm expeller ever. Since feeding it, I have the best bunch of shoats I ever owned. They are larger, seem bigger boned, and are free from worms, although before I fed the remedy they were infested with worms. I never saw hogs do as well as these."
—V. T. Pease, Conway, Iowa.

Feed Your Stock 60 Days at My Risk

In order to prove to you the value of my Great Worm Destroyer and Live Stock Conditioner, I freely make this liberal offer to every farmer and stock raiser, so that all may prove its value. Not only will SAL-VET destroy worms in your farm animals, but it will stimulate the appetite, relieve constipation, and put your hogs, sheep, horses and cattle in condition to better resist dangerous diseases. Thousands of farmers regularly feed SAL-VET to stock for SAFETY; you should not ignore this liberal offer. Here is the **cheapest live stock insurance** you can get.

Send No Money—Just the Coupon

Just fill out the coupon—tell me how many head of stock you have, and I'll ship you enough SAL-VET to last your stock 60 days—you simply pay freight charges when it arrives, feed it as directed. If SAL-VET has not done all I claim, and you report results in 60 days, then I'll cancel the charge, and YOU WON'T OWE ME A PENNY.

A Vital Factor in Modern Farm Equipment

Quick and comfortable transportation to and from town at small expense, comes with the ownership of an

Indian Motocycle

THE 1915 Indian — as usual — is an epoch-maker. 9 Basic Improvements, adding to the comfort, pleasure, strength, durability, speed, power, economy, and simplicity of operation, enter into its construction—a construction which, since the first Indian was introduced, over 14 years ago, has represented the highest known quality of materials and mechanical genius.

The $225 Indian is particularly well adapted to the many uses required by rural service. Long wheel base, trussed handle bars, high power, Cradle Spring Frame, Folding Footboards, Dual Clutch Control, enabling the rider to control the clutch either by hand or foot.

These and many other 1915 improvement features are fully described in the new Indian Catalog. But a personal inspection of the Indians themselves will give you a better and more convincing appreciation of Indian supremacy.

The Indian is made in the largest motorcycle factory in the world by a company that has established an unchallenged reputation for the honest high quality of its product. Standing squarely back of every motorcycle it makes, the Hendee Manufacturing Company has made the Indian a machine that typifies the best that manufacturing methods, mechanical mastery, money, and master minds can produce.

A chain of Indian branch factories, large distributors, and 2,800 dealers assure over-night service for Indian riders — *anywhere.*

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

The Old Farm

Just a word with you, my boy, about the old farm and farm life in general. I know you get mighty tired once in a while—that you get "sore on the job" and make a mental resolve to break away from it all some day in the dim and distant future when you have grown up and when you are your own master. You see I was a farmer boy just like you once upon a time—and as I write these lines the old scenes and the old days come flooding back to me. It seems but yesterday when they turned me loose with a twelve inch plow and told me to plow a "straight furrow." And my, how hard I tried!—and when, once in a while, the plow would run out of the ground in spite of anything I could do and old "Kate" wouldn't keep in the furrow, I don't mind telling you that I cried bitterly—back yonder years ago when I was just a "slip of a boy" on the farm.

But, after all, there are two sides to it, my boy. I know the road of the farmer boy is rough and hard—but it's the road that makes big, fearless, robust, manly men! Back yonder in those harsh days I, too, longed for the city just as perchance you are longing for it today but I understand a lot of things now that I didn't understand then. Viewed from the distance the bright lights look enchanting enough—but once familiarized with them the enchantment soon dies away. Cities annually kill thousands of boys and girls while the country builds them into splendid men and women and paints upon their cheeks the rose-hued flush of health. Today, every city in the land is crowded with erstwhile farmer boys whose muscle and vitality is being fed into the maws of its giant industries—farmer boys who stoke its fiery furnaces, who run its heartless machinery, its street cars or who perch upon high chairs up in some tall skyscraper and who, when the day's weary grind is at an end, betake themselves to some dark, cramped tenement abode where vile smells and poverty are ever companions—boys who have learned that the bright lights and the music are only for those who have idle time and the money to pay for them.

As I write these lines there comes into my ears the roar of Broadway in the mighty metropolis of New York. So, too, I see the thousands who jostle each other on State Street, Chicago—an endless procession of rich and poor, good and bad, rogue and christian—a procession which, like some dark river, flows on and on, day and night—it knows not whither. And as I contemplate these scenes the thought comes to me that I would a thousand times rather be an humble farmer boy trudging over a newly plowed field or wielding an axe in some sweet scented woodland than to be a mere atom in this mad human whirlpool which grinds and crushes out the hearts of men and women and makes them unmindful of the finer things of life. After all, boy, your chief aim should be to become a useful citizen—to do your part in the World's work—to become the owner of a home in which you are your own master—where you are more than a mere human machine at the beck and call of a harsh overseer—and such a destiny is within reach of every thrifty farmer boy. Remember that never before has American Agriculture been upon such a firm basis as now. Never before has the farmer been so universally recognized as the "first citizen" of the land as today—and improved machinery, the telephone and the automobile are fast eliminating the old-time drudgery. If, therefore, you would take the advice of one who has seen "both sides of the picture" I would say, stay by "the old farm." Learn the secrets of the soil and growing things in order that you may master and co-operate with them intelligently. In other words, determine to be a real farmer. As for the city's bright lights, I wouldn't trade one night's communion with the harvest moon for all the man illumined things in the Universe. As for its music, I wouldn't exchange the melody of the quail's call and the symphony of sweet throated birds for all the instrumental harmonies in Christendom. In short, my boy, there are mighty few places in this World—if any—that compare with "the old farm."

—The Author of After-Thoughts.

GEO. B. ELLIS
MANAGING EDITOR

VOL. VII APRIL 1, 1915 NO. 7

WILLIAM HIRTH
PUBLISHER

My 1915 Book Free
Here It Is-Read! Act!

My better than ever, bigger than ever, book of bargains for 1915 and price-reducing, sliding-scale schedules on gasoline engines and cream separators printed in four colors with special gasoline engine, manure spreader, cream separator, auto truck, elevator, carpet and rugs and vehicle color work; hundreds of illustrations of farm and household necessities. This great book will save you money. You are sure to buy something within the next few weeks on which we can save you money. Get my prices and learn all about my 1915 price-reducing, sliding-scale schedule before you spend another dollar for anything for the farm or household. A postal addressed to me now will bring this big book to you by the next mail, postpaid.

Galloway's Sanitary Separator

This new Galloway Sanitary perfect skimming cream separator is made so good in our own factories that I will send it anywhere in the United States without an expert to set it up, to any inexperienced user for 90-day free trial to test against any make or kind that even sells for twice as much and will let the user be the judge. It's the most modern—the most sanitary—the most scientific—the cleanest skimmer—the most beautiful in design of any cream separator made today and I have seen them all. I want you to know all about this wonderful separator that is sweeping the field before it. Investigate this before you buy.

$42.50 For 500 Lbs. Capacity

D-19

More Power For Less Money 6 H.P. $98.75

The New Galloway Masterpiece Big Six Horse Power Gasoline Engine at our new low price is positively the power sensation of 1915. The most engine ever offered for the money. My 1915 sliding-scale, price-reducing schedule still further reduces the above price according to the number sold.

This new design, big 6 H.P. engine built from the highest quality of material, mechanically perfect in design, smooth, easy running and well balanced, absolutely supreme in power, design and simplicity; not overrated nor light weight but large bore and long stroke, plenty of weight, low speeded, built for long, hard, continuous service; made in our own great factory by the thousands on automatic machinery, all the parts standardized alike, sold to you direct from factory.

Galloway Spreaders From $64.75 Up

Let me tell you about its special patented features; about its light, draft, its all steel gear and how it is built of heavy channel steel, trussed like a steel bridge, superior in every way to the new-fangled freaks of heavy draft that eat you up for repairs.

The above money-saving catalog fully describes the complete line of Galloway Specialties and will be mailed to you the day we receive your request.

SOME SWEET CLOVER TALK

"Sweet Clover Failed," in Missouri Farmer, March 1, is the experience of hundreds all over the country, and the one success, reported in that article, where the seed was sown upon hard soil, the experience of thousands.

Now I have no seed to sell and never will have, nor do I grow much sweet clover, as my farm is managed practically upon a four-year rotation plan and is all tillable, yet If I had rough land, strong land, badly worn land, gullied land, or land unfit for profitable tillage, I would not rest until it was all bearing a heavy crop of sweet clover.

The Editor of Missouri Farmer knows the writer of this, and he also knows that few men not living in the state have a better knowledge of the agricultural conditions of Missouri than I have, and I say to the farmers there, that you have tens of thousands of acres of clover in the state, now almost wholly unproductive of any farm crop, which would bring you hundreds of thousands of dollars income if only they were set in sweet clover. I have in mind when writing this, principally the value of the plant as a soil builder, having seen the results derived from its along this line from Lake Erie in the north to near the Gulf of Mexico on the south, notably in Southwestern Ohio, Northern Kentucky and North Central Mississippi.

If there was any section of the country more wornout, gullied and washed off, than the Licking hills of Pendleton county, Kentucky, twenty years ago, it was the one some few miles from Holly Springs, Mississippi, and both of these sections have been restored, to the state of good farm lands by sweet clover, for I have seen them—before and after taking.

The same may be said of some lands in this and in Clermont county, Ohio, both these lands lie in small tracts instead of in vast areas as in the other states. In four years after sweet clover was sown upon bare clay knobs, these same knobs grew 1000 pounds of tobacco or sixty bushels of corn per acre, good crops of small grain and good stands of grass being secured. Don't ask me to tell you how to succeed in growing it, but I will say that it is more apt to "take" upon a thoroughly compacted soil, than upon one that is loose and mellow. It seems to need, inoculation, lime, and a hard soil, and the finest stands I have ever seen came from a few accidentally sown seed, a plant every rod or two and then a solid stand from the seed, self sown, from these plants. One man who introduced it to his farm by a few seeds among his real clover, sown in April, says that sweet clover has been worth $1,000 to his 90 acre farm in six years.

C. D. Lyon.

SILAGE FOR HORSES AND MULES

I have delayed complying with your request for my experience with ensilage for the reason I wanted more time to enable me to know the results of feeding silage this winter. I began feeding ensilage December 14 and have fed it daily since to stallions, jacks, brood mares in foal, jennets in foal, yearling horses and mules, weanling horses, mules and jacks, brood sows, Angora goats and Jersey cows. I find all eat it heartily and keep in fine flesh. I feed about half the hay fed heretofore with corn. I give stallions, jacks, mares and weanlings a little corn but others get nothing but ensilage and hay. I have not had a sick animal this winter.

The youngsters that have come already are strong and healthy and get plenty of milk. I have had no udder trouble. I hesitated sometime on building a silo, doubtful of the results on the kind of stock I handle.

I am convinced now it is fine for all stock if put up properly. Corn should be nearly ready to cut and had better be too ripe than too green. A little water makes the ripe all right. The green gets too sour.

The silage must be well tramped in silo, which must be perfectly airtight. Moulded ensilage will kill horses. I feed stallions, jacks and mares in foal about 12 pounds per day, others all they will eat.

Does a silo pay? Yes, two ways. It pays because stock that eat it keep healthy and in good flesh. No colic, constipation, nor corn stalk trouble. It pays because an acre of corn will go at least twice as far in feed if in silo. This year, here, I think it was worth considerably more than double. The dry weather and chinch bugs nearly ruined the corn, and it made about 20 bushels of worm eaten corn to the acre. The stalks were small and many killed by chinch bugs. It rained about corn cutting time and ruined much of the fodder. I think my silo has paid for itself this one season.

My advice to every farmer, big or little, is build one or more silos. Build the kind you like, concrete, tile or stave. They are all good. But build one and do it this year.

Four of us bought a 50-ton per day cutter and we run it with a seven-horsepower gasoline engine. We swap work and it don't cost much to fill our silos. Two good hands with half a day's start and four teams and low wagons and two extra good men in silo. One man to run engine and see after the cutter. We put our corn in silo cheaper than we can cut, shuck, crib and haul out fodder. And we get more than double the feed and better, healthier feed besides. I would prefer two 100-ton silos to one 200-ton silo. Don't get in a hurry when filling silo. Take it easy and do it well. H. B. Chilton,

Chilton's Stock Farm, Pike County.

CORN FOR SILAGE

I don't know whether a man ought to venture an opinion from just two or three experiments, when the opposite view is held by a vast majority of silo owners. I believe the best corn should be put in the silo. Or take it this way: If you have corn that yields 40 bushels and some that would barely make 10 or maybe 5 bushels, as it was last year, put the 40 bushel corn in your silo. Generally corn has a stalk poportionate to the grain, i. e., 10 bushels of grain will have practically the same weight of stalk whether it be 5 bushel corn or 40 bushel corn. In 1913 I filled a small silo (75 tons) from 14 acres—200 bushels of corn. In 1914 I filled same silo from 7 acres—200 bushels corn. So it takes no more grain to fill from one kind than the other.

Every one who has fed corn fodder knows that fodder of good yield of corn is much superior to that of poor yield. When it takes the same in either case why not have the better?

One year I filled my silo part of good corn and not having enough of that to finish I used some of very inferior quality and poor yield. In feeding it there was as much difference as would have been had it been fed dry. Leaving the grain out of the consideration, the feeding value of good fodder (from good corn) in silage is proportionately greater than light fodder (from light corn) and costs just the same to put up. P. P. Grinstead,

Pettis County.

We appreciate the help of those who are trying to aid us in building up a real Missouri farm paper—something which Missouri has never had before.

Hayes Four Wheels-Bigger Yields

28 Years the Leader

YOU CAN have the benefits of better planting and vastly better crops with the Hayes Four-Wheel. Every kernel planted *exactly the same depth*—every hill in *perfect* check—an even stand—*surer* germination and *quicker* growth—no missing hills, *no bare spots* in your fields; such conditions will mean *more* corn for you, *better corn, more money*.

This planter is *guaranteed*. It *must* be all we claim and all you expect. 180,000 users verify that Hayes Four-Wheels regulate depth of planting to the *fraction of an inch*. Corn all comes up at the same time, allows earlier cultivation, an earlier harvest, a *better quality* and *bigger quantity*.

Hayes Four-Wheels guarantee *surer germination* and *quicker growth*. Wheels pack the dirt around the corn to hold the moisture and leave a *ridge of loose soil* on top. Ridge over corn prevents washouts in hilly fields and gives greater surface for sun's heat.

Covers where all ordinary open wheels fail—even in wet and sticky ground. Guaranteed not to clog. Short coupled, light draft and turns in shortest space. *Checks with absolute accuracy*, regardless of team's speed. Cross rows straighter than the way you drive.

The Hayes Drop *never misses a hill*. Simple, reliable and most efficient. Fewer parts, less breakage and delays. Has no clutch to miss and give trouble. *Never cracks or grinds the seed*. Will drop accurately any size or shape kernel. *No bare spots* in Hayes planted fields. No replanting necessary. Increased yields soon pay for it.

Free book "A. P." of Planter Facts tells all about the Hayes. Write for it today — a postal, or if you wish a letter, asking any questions on planting problems.

HAYES PUMP & PLANTER CO., Galva, Ill.

Fence Your Farm The "APEX WAY"

Save Work and Money

THESE two books will tell you how you can save work and money and have better looking fence the "Apex Way." Let us send them to you free. They show how easily you can put up APEX fence — how the "swinging joint" lets it fit hilly ground as readily as level stretches, and how it keeps its shape and always looks neat.

Save Post Hole Digging By Using APEX Steel Drive Posts

They cost less to use than wood posts and outlast a generation. Can be driven into any soil, gravel or soft shale rock. Made of elastic carbon angle steel—the strongest and toughest post material known. Use Apex Posts for your next fence—save work—save 8 to 10 cents in setting each post—have better looking fence—burn fence rows clean—ground the lightning and protect stock.

Write for Free Books

Read the helpful hints on fence building that we have outlined for you in the "Apex Way."

The Missouri Farmer

VOLUME VII APRIL 1, 1915 NUMBER 7

Farmers Should Organize to Improve Social Conditions

By Geo. B. Ellis, Managing Editor

Profit is essential to both prosperity and pleasure but it is what the dollar represents that should claim our chief attention rather than the dollar itself. I have tried to show in previous articles in The Missouri Farmer what a great disadvantage the farmers of this country are laboring under when their interests clash with others because of their lack of organization. It matters not whether it is in the National Congress or the State Legislature, the farmers' just claim for remedial legislation is set at naught. For years the farmers of this country have been struggling under the breaking burden of a five billion dollar debt at twice the interest rate of competing farmers of Europe. All the great political parties of our country have been forced to acknowledge through their national platforms that the farmers' demand for relief from this unjust and unnecessary burden was reasonable and that a remedy ought to be found. But Congress never for a day seriously considered this relief for farmers. Even the president pleads ignorance on the subject of rural credits and begs for more time though he had at his command information gathered by his own commission from all the leading countries of Europe where rural credit societies have been in successful operation for several decades. We have borne this burden of high interest rates on top of a staggering load of debt and must continue to bear it without relief because the money power of this country is so well organized and has its fangs so deep in every industry of the land that without organization the farmers will never be able to shake it loose.

Something Besides Production and Marketing

I have also called attention in previous articles to the economic or business needs of organization among farmers. We must organize to increase production because without large production on high priced land there can be no profit. And after we have learned how to produce high yields it is just as necessary that we find a profitable market. But after all what profiteth it us if we gain all these—necessary legislation, greater production, and better markets for both selling and buying—unless we are prepared to turn our money into the better things of life? What good will more money do us unless it will bring us a greater enjoyment of life by giving us better roads, better schools, better churches, better health, and better homes? And the thought I want to have sink deep into the minds of the readers of The Missouri Farmer is that we can not have the best of these, better social needs, without earnest, well organized co-operative effort.

Good Roads Come First

I have placed first in the enumeration of these better things "good roads" because I believe a system of good roads in any farm community will materially aid in bringing about all these other things. Too many farmers think that all they have to do to get better roads is to vote a levy for that purpose and then go on about their own business and leave the improvement of the roads to the overseers, the highway engineer, the township board and the county court. It may be necessary to leave the actual building of roads to those officers but you may count on it every time that the community that gets behind the road officers with an enthusiastic, well organized sentiment for good roads will get more road work for the dollar and about four times as many dollars as the community without organization. Take as an example the Missouri inter-county-seat road-dragging law. The state out of its road fund pays fifteen dollars a mile for the maintenance of these roads. A fact familiar to all our readers is that between most any two county seat towns there are two or more roads of equal public utility and equally available but only one enjoys the benefit of this fifteen dollars a mile and fifteen dollars a mile is amply sufficient to maintain most any good dirt road after it has been put in condition. But what road gets the state money? Who is it that are enjoying good roads at the expense of the state and without going deep in their own pockets to pay for them? Is it not the people who put forth the best organized effort before the county court to have their road selected. Then take the matter of building bridges. Why is it that in the same county where all pay the same rate of road and bridge tax you will find one crossing with a good bridge and another of equal importance is left without a bridge for years? It is not unusual to see, when traveling through the country, a neighborhood with all the culverts built substantially of stone or cement while an adjoining neighborhood is getting along with the old and unsightly wooden bridges. And why is it? The difference is in organization. The neighborhood that is organized has leadership and team work and both are essential to success.

The Money Value of Education

Farmers as a body have not placed a high enough value on education and by that term here we mean in its narrow sense—school training. Too often we find men who may have succeeded in spite of any school training at all or at least with only the most elementary book knowledge, who think that the only training of economic value to a farmer is that which he gets by the hard, slow way of personal experience out of the fields and the feed lots. But when we examine into the facts we find that even a farmer—whether he be land owner or tenant—will upon the average get a large money value out of an education and the more thorough it is the more valuable it proves to be. A recent survey made by the farm management department of the state university, getting first-hand information by visiting the farmers and taking their own statements, shows that out of 272 farmers who now own their land but who started out as renters, for those having only a rural school education, it required on the average 4.7 years before they became owners of land while those having a high school education became land owners in 2.4 years. The average yearly income the farmers received who had obtained only a rural school education, after all expenses and interest on investment was allowed, amounted to only $218. Here the value of extra time spent in school stands out very strikingly because those who had high school or college education received an average labor income of $808, which is $590 a year the high school man is able to get out of his labor above what the man receives who has only a rural school education. Among tenant farmers, upon the above basis those who had a high school training had a yearly net labor income of $265 more than those who had received only the training of the district school.

A High School Possible in Every Neighborhood

I need not stop here to discuss the value of a high school or college education for increasing a man's usefulness to society, his power of leadership in church or state and his capacity for greater enjoyment obtained from books and other literature as well as from social intercourse with his fellowmen. But may be all this mention of the value of education is unnecessary in this article. Possibly all our readers will agree at once to this contention and want to know how we are to make it possible for every boy or girl living on a farm in the state of Missouri to have the opportunity to get a high school education? My answer is by organized co-operation. Under the law of Missouri giving state aid to high schools it is possible to build and maintain a good rural high school in any fairly good agricultural section of the state if the people want it. No individual can do this alone but if he has the leadership it is easily possible for him to bring about an organization of the community that can do it successfully.

The first step is to talk it over among the neighbors—the fathers, the mothers, the children—and if it is found there is a wholesome desire for a better school then a letter addressed to your county school superintendent will, in all probability, bring that official right into the game, and from that on he should direct the organization. If the county superintendent should fail to get enthusiastically into the effort, then the state superintendent of public schools, Jefferson City, the teachers' college of the state university at Columbia, or the state normal school in the district will any or all be ready to furnish the desired information as to what details of organization are necessary. There is not a good farming district in the state—we repeat, not one—but what a territory of four to six miles square can build and maintain a good high school with the direct aid the state will give and with less than one-half the cost now sustained by many of our towns and cities. The question is, do you want a high school for the benefit of your children? Do you want to give them the increased earning power we have shown it will give them? Do you want to give them this increased capacity for enjoyment and usefulness in society? If you want to do this there is a way to do it and only one way and that is by working together—by organization. And perhaps, dear reader, you are the one to lead it. Will you try?

Shall the Rural Church Live?

The welfare of this nation and all other nations rests upon two pillars, the moral and material prosperity of the people. These must both go hand in hand if in the future we are to maintain our position as a nation. Just as the free school is the bulwark of our intellectual and material prosperity, so is the church the chief corner stone of our moral progress. If these propositions are true, then we must look upon the decadent condition of so many rural churches with sorrow and with alarm. I ask my reader to take a mental picture of the condition of the rural churches in the territory of his or her acquaintance. How many of them are growing? How many are standing still? How many are positively on the decline? From information furnished us by Dr. A. W. Taylor, Secretary, Bible College, Columbia, we learn that from a survey of 2,000 rural churches about 45 per cent were dead or losing ground, 23 per cent were standing still and only 32 per cent, fewer than one-third, were growing or making any progress at all. The rural church should be the very embodiment of co-operation in all the work for the social as well as the religious life of the whole community. Dr. Taylor very aptly says, "If the rural church was a community church it could be the common meeting place of the neighborhood for all things good. In it the youth could gather for socials and recreation and these golden means of character building could be utilized by the church for the cultivation of religion. The average rural neighborhood has no adequate meeting place for the social life of its youth. Farmers' clubs, mothers' clubs, domestic science classes, sociables, farmers' institutes and other forms of profitable neighborhood organizations could find common roof under the one place that ought to be the community center."

But no matter how well organized any neighborhood may be with the school or the church, there is yet a broad field left open for the farmers' club, the homemakers' club, the corn club or pig club for boys, the canning club or sewing club for girls, the grange, the farmers' union and various other organizations, all of which are doing a wonderful amount of good wherever they are at work and whenever the right co-operative spirit is manifested. It is only possible to touch this question in a suggestive way in the brief space allotted to this article, but we have said enough to show that the opportunities for social, moral and intellectual betterment are limited only by the breadth of the desire of the people to make progress and by the co-operative spirit of the whole community. No man is too weak or too strong, too small or too great to join hands with his neighbors for the common good.

THE COMMENCEMENT HORSE SHOW

The First Annual Commencement Horse Show was held under the combined auspices of the students of the College of Agriculture and the citizens of Columbia during Commencement Week at the University, June 1 and 2, 1914. It was held on the University Athletic field and was pronounced successful by those who attended.

The idea of the Commencement Horse Show had its origin with the students in the College of Agriculture who were able to see the good which might be derived by all concerned from such an institution. They called to their aid the citizens of Columbia who responded very liberally. In order to finance the show 150 citizens of Boone County guaranteed to pay any sum up to $10 each in case the Horse Show was not a success financially. The Agricultural Club, which is an organization of students furnished some $200 for running expenses prior to the time the show was held. The attendance at the show, which was the only source of revenue, was sufficient to pay all bills involved and premiums awarded.

Commencement week at the University has come to include a number of different entertainments staged by the various schools which compose the institution. The agricultural students took as their part of the program for this week, the Commencement Horse Show which was held on two different afternoons. About 30 classes were exhibited and judged and $1100 in premiums and several hundred dollars in plate were awarded. The students of the University and many citizens of Columbia and Boone County, besides citizens of other parts of the state who were interested in horses attended the show. The object which the students and citizens had in scheduling the Commencement Horse Show was to furnish a means of high class entertainment which would at the same time serve as an educational event and furnish an opportunity for those who attended to become better acquainted with each other and with good horses. It clearly gave those who were not familiar with the ideals and efforts of the students, a close insight into the thoughts and ambitions of students, particularly in the Agricultural College.

Officers of the Horse Show made every effort to establish one which would be high class in every respect. The exhibition of good horses by reliable and high class people was encouraged. Exhibits from individuals of any other sort were not encouraged and would not have been tolerated. An effort was made to secure an attendance of people whose ideals were high and who would come to the Horse Show for entertainment and instruction. That this object was accomplished is the testimony of all who attended the show or who knew of its character. Students, and their parents who were here for Commencement exercises came in large numbers, some of the business houses of Columbia closed during the time that the show was in session. Automobiles filled with people came from the surrounding county and the various nearby towns. Many horse enthusiasts from other Missouri towns came by train and spent both days. It was a general getting together of 1500 to 2000 people with the horse occupying the center of the stage.

The most important result of the Commencement Horse Show was the spirit of co-operation in the production of the event which had direct bearing upon the ideals of those in attendance. The spirit shown in the attendance at the show, the interest shown in the event, the good will seen among the people toward the student body and the effort made by the students to build up a high class horse show in which there would be a mutual interest, was ever apparent. Over and above this still remained the fact that this event carried with it a healthy moral tone which made for better ideals among all concerned and pointed to the fact that the object of students in the College of Agriculture and people outside that body were one and the same, i. e., the building up of an outdoor event which would be educational and inspiring.

With the results of last year so encouraging it has been decided to schedule the Second Annual Commencement Horse Show. Everything points toward even a greater success than was had last year. People who have horses to exhibit and people who live in the country tributary to Columbia are interested in the show. They want to see it a success because it has proven itself an event worth while. There is a disposition on the part of the majority of people to support the management of this show in every way possible. This spirit was born out of the good feeling which was seen to exist last year. The prime object of the horse show should be to furnish a place where those interested in upbuilding country life can enjoy health inspiring exercise and pastime; a better education in things agricultural; can get together and with common ideals and ambition, enjoy the good which comes from a high class educational entertainment. The horse show should provide a common viewpoint of both city and country people. While the horse is a farm product he is also of city service. While the automobile and motor truck have come to perform part of his tasks yet there still remain many functions for the horse to perform. Above all, the association with good horses is an inspiration and leads to the heightening of ideals and bringing out the good in the character of men and these should be considered of prime importance in studying the results of this particular event.

In conclusion it can be said that the Horse Show has no financial gain as its object. It simply seeks to make its revenue sufficient to pay its expenses. The work of students is given for the inspiration and enthusiasm which it creates among them. It is hoped that the future will see the Commencement Horse Show an annual event looked forward to by all. If it serves this purpose and thereby brings together high class men and women who have taken for their life work some form of agriculture as an occupation and the upbuilding of wholesome ideals, if it contributes to the public good, it will have accomplished the desired results.

E. A. Trowbridge,

At the 1914 Commencement Horse Show, Rollins Athletic Field, University of Missouri. First at reader's left is Mary Dowling, owned by Col. Paul Brown, St. Louis, D. E. Holman, rider. In the center is Kentuck's Best, owned by Miss Lula Long, Kansas City, John T. Hook, rider. At the right is Cason McDonald, owner and rider, Tom Bass, Mexico, Missouri. This ring compares favorably with the best shows of the country.

ONE SEASON NEARLY PAID FOR SILO

In your issue of January 15 I notice you appeal to those readers of The Missouri Farmer who have silos to write something of their experience. I am now feeding from my first silo though I have read all I could about the silo and observed the use of it by others for several years.

In the first place let me say that I believe the time has come when no one who owns and operates a farm can afford to be without a silo any longer if he expects his farming operations to be most profitable and at the same time keep up the fertility of his land. I believe that corn ensilage is the most economical feed that can be produced on the farm and it will enable one to keep and feed more live stock on his farm and make a larger profit than can be done by any other means.

There are several good reasons for this which I think can not be disputed. To begin with it is the very best way to conserve the corn crop because it eliminates waste and the corn is harvested early in the season when the weather is not cold and before the crop has become damaged to any extent by weather conditions or wasted by birds, mice, and many other pests. Furthermore, it will transform an inferior corn crop into a most excellent and economical feed for all kinds of live stock although the better the corn the more food value in the ensilage of course.

In the second place the crop can be removed from the land early in all sorts of weather conditions and land sowed to wheat, rye, or other forage crop which will get a good growth before cold weather and greatly reduce the cost of the winter's feed. If you should wish to have a corn crop on the same land the next year this wheat or rye after providing green forage during the fall and early spring months and preventing the erosion of the soil, can then be plowed under and the land will be in better condition for another crop of corn.

Furthermore, if your silo is properly located your corn crop is right where you want to feed it and where a large number of live stock can be fed with the least amount of labor and where weather conditions do not interfere.

Now as to the particular kind of silo you should build I do not consider that so important provided it is air tight and keeps the ensilage well. Mine is a stave silo made of Oregon fir and it has been very satisfactory so far, as my ensilage has kept well and all my stock seem to be very fond of it and thrive on it. I believe if a good stave silo is well anchored into a deep concrete base and is kept painted on the outside and tightened during the summer months it will be of good service for many years.

As to the size of silo one should build, I should say that will depend upon the acreage of corn you wish to plant for that purpose each year and the amount of live stock you may wish to feed daily after the silo is opened. An estimate should be made of what your acreage will yield in a season of short crops so that you will always have enough corn to fill the silo. I think about the surest way to estimte the amount of ensilage per acre is to figure one ton for each foot in height of stalks per acre for checked corn. For instance, if the stalks will average 8 or 10 feet in height and are evenly distributed over the field you may expect to have about 8 or 10 tons of ensilage per acre. After the silo is opened it is important that from 2 to 4 inches of the surface be fed each day, especially if any of it is fed to horses, so that it will always be fresh and free from mould. I have been told by a competent graduate veterinarian that there is no danger whatever in feeding ensilage to horses and mules if it is free from mould and my experience so far verifies that statement. This alone should be an inducement to anyone to put his corn into the silo because so many horses have died from the effects of fodder poisoning during the past few years.

In order that you may have good ensilage I think it is very important that you put plenty of water into it while filling. I used an inch hose attached to a 10-bbl. tank of water and kept it running into the blower all the time. My corn had become pretty dry and I believe a little more water would have made it a little better. The water helps to exclude the air and some say you can not put in too much water, but I am not prepared to say about that, if your corn should happen to be put in too green.

Another important factor in producing good ensilage is to keep it well tramped while filling. I am sure you can not do too much of that because the tighter it is packed the better the air is excluded.

As to the value of ensilage as a feed, I believe it is by far the cheapest that can be produced on the farm. I think it is always best to mix other feed with it to get best results, but cattle will winter well on ensilage only. I am feeding a bunch of calves this winter and they eat about 25 or 30 lbs. each of ensilage daily. During the past two months of December and January they made an average gain in weight of 115 pounds. They were fed nothing but ensilage and the weather was very cold nearly all the time. My horse stock were not fed so much ensilage but a little timothy with it and they have wintered well.

In conclusion let me say that considering the present high price of grain and hay my silo will I believe almost save me its cost this season.

E. R. Hamilton,
Boone County.

OUTLOOK FOR PUREBRED CATTLE

Some time ago I received a letter from you asking what I thought of the outlook for the farmer raising pure bred cattle? I believe that now is the time to make a start and will give my reasons for believeing this: The fact that some of the states that have been the biggest producers of cattle for breeding purposes, have suffered by reason of the foot and mouth disease until, even where their herds have not been infected, the very fact that these states or even parts of these states, have been under quarantine so long that to mention that an animal is from this territory will "throw a scare" into the prospective purchaser. If Missouri can continue to ride through the storm without getting the infection, the buying public will pay a premium for Missouri-bred breeding cattle. Right now the west is watching us and if the Missouri breeder was in a position to make shipment, you would see our state drained of pure bred bulls in thirty days. But unfortunately the western states are quarantined so that we can not ship to them. I recently made a trip to the Shorthorn herd of W. A. Forsythe of Greenwood, Missouri, where I bought a very fine young white bull to head my herd. I also bought some good young Roan females of C. S. Parker. I find the heifer market (especially roans) high but the bull market is very low. I think Mr Forsythe sums up this situation pretty well and will quote him in this matter A friend and I had written him for prices on two good young white bulls of Scotch breeding and he priced one at $300 and one at $250 We went to look at them at these prices and after looking at them asked what would buy the two bulls. Mr. Forsythe's reply was: "Now before I quote you as low a price as I am going to on this pair of bulls, I am going to tell you why I am doing it. I remember the price I quoted you gentlemen on these bulls and it seems silly for me to make you the low price I am going to and I don't want you to think that I am doing it because I feel like I had priced them too high, for I consider them worth the price I made you. But I have about 60 bulls here that need to go; I have calves in every pig shed on the farm; I am simply loaded with cattle; and while my commission man at Kansas City told me yesterday that he could give me an order for 200 bulls if I could ship them, I have no assurance when this quarantine will be raised so I can ship—it may be in time for the western breeder to get these bulls for spring service and it may not—and while I am waiting to see what may be done, I can do nothing but take care of these bulls. I need my time to be doing something else and my winter and spring calves are beginning to come, so if any of my Missouri friends are in the market for bulls and will come to me they are going to get them; and if you gentlemen are in a position to buy, I am going to make you a low price." We informed him that was our business there, so he said: "I am going to make you a price of $400 on these two bulls." We bought the bulls without asking for any more reduction for we felt that he had stated the facts, and that he had quoted us a better price than he would if conditions had been normal.

Now the small breeder who depends on his local trade to take his bulls, does not feel this loss. Any breeder can sell ten or twelve bulls at home and not be hurt and get good prices. But the big breeder who has built up a car lot trade to western men is the one that is hit hard. He has to hunt new territory for his surplus, and to sell the quantity they have takes some rustling to sell one at a time. At my annual sale of Berkshire hogs in January, I sold 3 registered bull calves and 3 grades, all were sired by the same bull and grades averaged a little older than pure breds and were from equally as good dams. All were too young to sell, yet my pure breds brought $50 each and my grades $27; this leaves quite a nice balance in favor of the pure breds, as all fared alike. If my bull calves had been three months older, so they would have been old enough for Spring service, I am sure the average would have been much better. No farmer should miss the chance to buy a good bull now, and he should buy RIGHT NOW, for if this quarantine should be lifted it will be "good bye bulls," for the western breeder knows where these bulls are and if conditions are so they can get them, I believe the State of Missouri will be drained of good bulls in thirty days, or less time.

Then the commission man has orders for them and he is in touch with every big breeder in the state; his future business depends on his western friends getting bulls, and he will order them out as soon as possible. Now it seems to me that Mr. Farmer should lose no time in getting in touch with these big breeders and "BUY A BULL NOW." These big herds have not been culled and you can select just what you want and, believe me, the owner will make you a good price. Why should Missouri act as the breeding ground for the good bulls for the west, and the Missouri breeders use culls? If there is any one line of stock that the farmer needs a good "shaking up" about, it is cattle and hogs.

We are simply breeding to what ever kind of a bull and boar that our neighbors happen to have, regardless of breeding or quality. This is bad business policy. We can not afford to put 75c corn and $18 hay into old canners, neither can we afford to breed to the scrub bull and sell the calf at his value, when a few more dollars invested in a good pure bred sire will double the price obtained for the calf. You can't go wrong in buying a good bull right now. If you do not feel like letting loose of $100 for a good calf, just talk it over with your neighbors, and two or more buy one; you will be making money for yourself and your neighborhood.

Ben T. Prigmore, Saline County.

CORN

wants what it wants — when it wants it.

THE "Breeder's Gazette", January 21st, says,—"There are times when quick action is a straight road to profits. If there ever was a time in our agricultural history when bumper yields should be assiduously sought it is in this year of 1915.

No matter how rich your soil,—no matter how much plant food you may have in it, for this year's crop, you need this year's plant food,—the quickly available kind, all ready to nourish the corn and wheat, to mature the bumper crop in time for the bumper price.

Empire Heavycrop

Supplies this kind of available plant food,—available phosphorus, available nitrogen and available potash. According to soil experts, all these are needed in most soils, and in this brand we furnish them in an available form. Remember, wheat and corn do their principal feeding in 60 days and they "want what they want when they want it."

TRY-A-BAG. Cover an acre for $1.50 to $3.00. See for yourself the value of available plant food. Make every acre worth two. Get the best results from your cultivation and rotation. Get our price on any quantity you want, from one bag upwards, shipped to your own freight station. Get our agency proposition and carload inducement. Write for our interesting booklets "King Corn" and "Better Crops",—both are free. Write today and have it off your mind.

EMPIRE CARBON WORKS LOCUST STREET, ST. LOUIS, MO.

Sweeping The Field

FRIENDS, here is the New Galloway Sanitary Cream Separator! Its clean skimming, its perfect mechanical design, its smooth oval, sanitary surfaces and years of built-in satisfactory service are winning us customers by the thousands. It is made so good in our factories that I will send it anywhere in the U. S. without an expert to set it up, to any inexperienced user for a 90-day test against any make or kind that sells for even twice as much and let you be the judge. It's the most modern, the most sanitary, the most scientific, the cleanest skimmer, the most beautiful in design of any cream separator on the market today and I have seen them all. Get my new 1915 price-reducing, sliding-scale proposition before you buy a cream separator of any make or kind at any price. Just drop me a postal today. Address

CARE OF THE NEW LAMBS

The present price of lambs makes it highly important that they receive all the attention that they need. The flock has been the "mortgage lifter" for the farmer this season. The high price of mutton and lambs and good prospective price for wool has set many farmers to thinking more seriously about his flock.

Many of the early lambs have arrived and the lambing season is about half over. The docking and castrating of the lambs should not be neglected longer. Docking is a very simple operation and can be accomplished with practically no danger. Market men state that docked lambs are worth from 25 to 50 cents more per 100 pounds—primarily because they present a more attractive uniform appearance which is of much value. Lambs usually scour a little when first turned on grass and the dung collects on the tail, making a very bad appearance and an excellent place for maggots to grow and cause trouble.

If the lambs are young the tails can be taken off with a knife about one inch from the body. Lambs up to two weeks of age can be successfully docked with a knife. This method has the advantage of requiring less labor and the wound heals more quickly than a lamb docked with hot pinchers. The hot pinchers are used more successfully on older lambs because by this method there is practically no danger from bleeding. The pinchers are nothing more than large iron shears which are heated to a good red heat in a portable forge or more conveniently in the flame from the tinsmith's gasoline blow torch. These shears can be purchased from any of the sheep supply houses for $1.25 to $1.50 per pair.

When docking lambs with hot pinchers care should be taken not to be too quick nor have the irons too hot. The ends of the blood vessels must be thoroughly seared to prevent bleeding. In order to prevent burning the body of the lamb it is advisable to put the lamb's tail through an inch board nailed to some convenient post—one man holding the lamb while another operates the hot pinchers.

Castrating is not so important as docking if the lambs are to be sold in June or early July. However, if they are to be kept over the summer it becomes very necessary to castrate the ram lambs. It should be done at the same time as the docking is done.

One man docking with a sharp knife

One should select a warm, bright day for docking and castrating to prevent cold and other attendant difficulties in case the lambs bleed badly and become weak in condition. It is also preferable to dock and castrate the lambs as soon as they become good and strong—from two days to three weeks of age, depending upon the condition of the lambs. However, if the farm work does not permit the docking and castrating at this time, it can be successfully done at an older age.

Newly castrated lambs should not be disturbed for 12 to 24 hours. That is, they should not be driven any distance.

If one is careful and clean there is practically no danger from docked and castrated lambs.

Howard Hackedorn,
Missouri Experiment Station.

Docking with red-hot pinchers takes two men

THE FARMER SHOULD BE A BETTER BUSINESS MAN

Why doesn't the average farmer make more money? The Scriptures say, "the love of money is the root of all evil," and if he respects this teaching he does not make money his god. But "Godliness with contentment is great gain. For we brought nothing into this world and it is certain we can carry nothing out. And having food and raiment, let us be therewith content." We do not believe there are many of this class, but we think most farmers, just like other people, are trying to make all the money they can, but do not make money so fast and easily as they would like to. There are various reasons why they are not making more money—perhaps many more reasons than I can give.

First, the farmers are paying more than their share towards the support of the government. The middle men—business men, so called—absorb more than one-half the money which the consumer pays for farm products—that is too much considering the service they render. Another reason why the farmer is not more prosperous is that he is not as a rule a good business man. The farm papers should help the farmers along this line so that he will become a better business man and he can then buy and sell to better advantage and greater profit.

The merchants of my town have long since called me a "poor customer" because they say I don't buy enough and that I am always trying to sell something and that I want a price that don't allow them to double their money. Perhaps this will cut me out of the class of the average farmer but I am asked to answer this question from the point of view of the "average" farmer.

I admit we (our family) are poor customers for the groceryman because we grow a great variety of the very things the groceryman has to sell and of course we eat what we need of our home-grown produce at the fifty-cent cost instead of buying at the store as so many farmers do at the dollar price. Here we save fifty cents and that is profit to us. The "average" farmer buys many things which we produce and which he could and should produce. We have better, fresher produce on our table, full weight every time—free from paper sack and tin can flavor.

We are also poor customers for the doctor for we eat apples instead of pills and we drink good clean milk from our own cows instead of we-know-not-what out of a bottle. The average farmer uses tobacco but as we do not we can add that to our profit account. Tobacco is used at a great cost to both body and mind and the user can't perform the best service—tobacco causes many to be "therewith content" even without sufficient food

Why Disk Cultivating Brings a Better Crop

As you see in the illustration above, the disks leave the roots intact, down in the soil. The shovel cultivator cuts them off and lifts them toward the surface. Here, roots cannot get moisture—the plant is robbed of nourishment. The shovel turns the hard baked soil down to the roots and throws the moist, life giving soil up to the sun. The disk cultivator rarely goes deep enough to cut the roots. Should the disks touch the roots, they leave them deep down in the moist soil. The disk rolls over the soil. Its pressure is always downward. The disk blade keeps mulching the surface and killing the weeds, in any kind of soil, no matter what variety or in what quantity the weeds may be; when the field gets full of clods, the shovels knock them about and break the corn. The disks cut and crumble the clods to form a surface mulch and conserve the moisture below.

JANESVILLE Disk Cultivator

Manufacturers of Farm Implements

Corn cultivators have been our hobby for half a century. Here is a cultivator that we consider as near perfect as can be made. You can tilt the disks to any angle—in or out. Disks cut deep or shallow and do a good job of hilling or level cultivation. Following the disks we have a surface blade. The blade is sharpened and its action on the spring steel holder practically gives you two cultivations with one trip. This surface leveler is found on Janesville cultivators only.

Cultivate your corn this year with the Janesville Disk Cultivator. Increased corn yield usually pays back its cost with the first crop on 40 acres or more. It's easier on the horses, too. A rolling, springy motion of a disk is a much lighter pull than the dead drag of a buried shovel. You can cultivate more acres per day and do the work better.

Write for Literature

and read more about the advantages of cultivating your corn and potato crop with this disk cultivator.

Champion Deering McCormick Milwaukee Osborne Plano

or raiment for themselves or families. Useful industry and true economy which includes the economy of health furnish the only true basis of real prosperity. Those who practice anything else will ultimately fail to hold the place of even an "average farmer."

Many farmers buy too much machinery and then fail to take good care of it—to put it under shelter when not in use. Too many depend on buying feed for stock that should be raised on the farm. Some women want a house larger and better furnished than the farmer can afford and they seem to think that clothes are made for other people to look at instead of for their own comfort and convenience and so they spend too much trying to keep up with the latest styles of dress.

Many farmers are handicapped by lack of help. It is hard to get sufficient hired help that is reliable. We solved that problem by training up three sons and three daughters of our own which we think is a family of about the right size, yet the "average" person seems to think it a disgrace to have such a large family.

Through industry, but not over-work and by economy, but not stinginess we have lived well and can give each of the children 100 acres of land and we owe no one anything.

While we have been grandparents several years, we are only as old as we feel which is about the same as when we were married thirty-five years ago. It is not so much the amount of money people make as it is the use they make of it that decides whether they shall be poor, average or about the average.

You ask for a photograph of myself and home but I think I am more modest than the "average" farmer and as I am little and old and my hair is turning gray I don't believe my photograph would be considered an ornament. Our house is two story with basement, has ten rooms, bath, gas lights, but is without ornaments, not even lightning rods nor plastered with a mortgage.

B. F. Wampler, Jasper County.

[One fine thought in the above article is that "It is not so much the amount of money people make as it is the use they make of it" that makes the difference between a poor and a good farmer. The farmer has an advantage over others in that he can enjoy many of the finest things of life without anything save his own industry but after all there are many other things if we enjoy we must pay the price and therefore farming should return him a profit.—The Editor.]

Firestone

Has Done Better Than Meet Popular Prices

HERE, is one example: a small size, 30x3, plain tread, shown actual size. The same relative values apply in all sizes. Note the detailed specifications of the section opposite. Then ask any neutral repair man which manufacturer gives the most in quality. He cuts into all makes of tires. He knows.

You want that extra layer of fabric in the Firestones—4 plies instead of 3 in this small size—7 plies in the 5-inch Firestone, for instance, instead of only 6 in the ordinary.

You want that cushion stock in the Firestone. There is none of it in ordinary tires. Yet it is impossible to build a full service tire without a cushion layer under the breaker strip. You must have it to prevent bruising and overstraining the fabric.

Firestone Tires have never been built down to a price. You will find everything in a Firestone that ought to be there. Firestone Tires are vulcanized by the "two-cure" process. This is more expensive than the "one-cure," but it allows rigid inspection in the making and eliminates fabric buckles and other defects.

The Sections Show These Things—the Wear, the Mileage, Prove Them

Take the word of the specialists of the industry—take the record of the Firestone Tires for 15 years—as your authority that these extras of quality are necessary for real service and economy. The Firestone organization, the largest in the world specializing on tires, can make and market tires and tubes at the lowest possible cost to you, the user. The tires and prices prove it beyond argument.

Firestone Tube Prices Give Added Proof of Firestone Savings to You

Firestone is below them all on tubes. WHY? A tube is good or bad to the eye and the touch. Quality can and does vary, weight can be and is skimped, but not so radically as in tires. The buyer won't have it. Having to come near meeting Firestone quality in tubes others must go above Firestone in price.

Because, as stated, Firestone manufactures and markets at minimum cost to you. But we are no more proud of giving you the best tube below the others than we are of giving you the best tire for so little more. And the proof of appreciation among car-owners lies in the fact that their demand for Firestones last year established 50 per cent more dealers for us and increased our output 78 per cent.

So compare the tires inside. Compare the prices. Compare the service records among your acquaintances—then get Firestones from your dealer and enjoy—

Firestone Net Price List to Car-Owners

	Case Round Tread	Case Non-Skid	Grey Tube	Red Tube

"America's Largest Exclusive Tire and Rim Makers"

THE CRIMSON TRAIL OF A NEW IDEA

"The wise in heart will receive commandments; but a prating fool shall fall."

"For wisdom is better than rubies."

"A wise man will hear and increase in learning."

"Wisdom crieth without; she uttereth her voice in the streets." "How long, ye simple ones, will ye love simplicity? and the scorners delight in their scorning, and fools hate knowledge?"—Proverbs.

A new idea has always been a dangerous possession. In the older days men were killed and tortured for maintaining a new idea, but in our modern days he becomes an object of the scorner. He is despised by those who "hate knowledge." The mob do not crucify him for fear of the law. All the law allows now is to say nasty things about him, and make "smart remarks."

The martyrs of Bible history were men with new ideas, and who had manhood enough to announce them and defend them, and many such went down to death at the hands of a howling mob.

It seems evident that the real discoverer of the circulation of the blood, dared not make his discovery known lest he would be put to death. Gallileo wrote out his discoveries but dared not allow them to be published until after his death, lest those who "hate knowledge" would kill him.

Columbus had an idea that the earth is not flat, and he was called a heretic and a fool. Some thought him insane, but one woman thought it a good "bet," so outfitted him and sent him to sea. Result—branded as an imposter and "faker," put in prison and died in neglect, poverty, and disgrace. So much for living ahead of his time.

Had Alexander Graham Bell lived in Salem, Mass., only three centuries ago, and had been caught talking into a tin can with a wire to it, the wire reaching to another room and a man listening at another can, and could hear each other, they might not have killed Bell for discovering the principle of the telephone, but they would have been sure that he was bewitched like the cream in the churn, or the horse that went lame, and it would have looked like some poor, wrinkled old woman had bewitched him as she had the cows, and the lame horse and many other things. Bell was surely blaspheming the Almighty because the Almighty never intended people to talk along a wire, but the fault could not have been Bell's but that old woman had bewitched him. Suspicion would have grown more and more intense, until finally the mob insisted that she be tried in the name of the law for "bewitching a good man." She is ar-

GET MY PRICE

WAIT **DON'T BUY** a Gasoline Engine of any **make, kind** or **price** until you first get my **new low price** and 1915 price-reducing schedule, in which the more we sell the more we reduce the price, and the buyer gets the benefit. It will pay you to investigate NOW.

We give you MORE POWER for LESS MONEY because QUALITY is our WATCHWORD and VOLUME our MOTTO. We are the largest manufacturers in the world making gasoline engines selling direct to the consumer. All we charge you for is ACTUAL COST of MATERIAL, ACTUAL COST of LABOR and one very small profit based on the most tremendous output. The Galloway Masterpiece BIG SIX and other sizes are made in our own factory in enormous quantities. All parts standardized and alike, made by the thousands on automatic machinery.

Sold to you direct for less money than engines no better, and in many cases not nearly as good, can be bought by dealers in carload lots for spot cash.

Orders are pouring in for the New Masterpiece Six in a perfect stream. WHY? Because we give

More Power For Less Money

than anybody in the engine business today. Remember our engines are not overrated nor high speeded, which means short life, but are rated by time-tried experts, not impractical college professors; have long stroke, large bore; heavy, and built for heavy, continuous, hard, satisfactory service.

When you buy a horse you don't want a Shetland pony. You want power and plenty of it so that it won't lay down on the job.

Don't Get Fooled

By the kind of talk intended to sell you a light weight, small bore and short stroke, high speeded engine that will not stand up under the power strain demanded.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII April 1, 1915 No. 7

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

MERIT WILL WIN

A man is sometimes engaged in a good cause and for a time fails to get much support or following, but if his cause is just and he has enough tenacity of purpose to hold on he will finally win. Any change from established usage will always meet with opposition because we can not all see even a good thing at the same time. When the agricultural colleges were first established they were bitterly opposed and denounced as impractical by ten farmers to one who could see any good in them. And after many years of development and betterment there are a great many farmers who will not admit there is any good in an agricultural college. It is not surprising then that so many farmers can be found who oppose the recent move to help farmers—that of putting on a county farm agent. Of all the counties in Missouri employing a farm agent or farm adviser Pettis county secured the man best qualified by experience to fill such a position. But after nearly three years of efficient, earnest labor among the farmers of Pettis County there is still much antagonism among the farmers toward the employment of a farm agent. Sam Jordan, well known to most of our readers and one of the best known agricultural leaders in the state, is the county agent in Pettis County and during the nearly three years in that capacity he has held public meetings in nearly every school district in the county, has sent out thousands of circulars, has written many columns of information for the county papers and has visited hundreds of farms and given personal assistance, and yet recently a remonstrance was sent to the county court protesting again Jordan's re-employment and this remonstrance was signed by 585 persons. When these names, however, were compared with the tax lists it was found that 144 of them had not payed one cent of tax for any purpose.

At the same time a petition was filed asking for Jordan's re-employment which was signed by nearly 1700 names, about 1000 of whom were farmers, the others business men, professional men and others. This is a fine endorsement for Mr. Jordan's work in the county. When the petitioners are three to one as against the remonstrators and when these represent largely the men who pay the taxes of the county, it is good evidence that his work has been profitable.

We have always maintained that the farm adviser or farm agent as now called must show by trial that he is worth the money, otherwise his job was doomed and Pettis County farmers have decided by a large majority that the county agent is earning his money and that they are going to keep him.

PROFITABLE USE OF FERTILIZERS

The Missouri Farmer has always maintained that any farm practice to be permanent must be profitable and if any method or system can show a profit under ordinary conditions there need be no anxiety about its permanency. We have at all times taken the position that a proper use of commercial fertilizers was profitable and furthermore that under the conditions found in Missouri that the use of mineral fertilizers is essential on most farms for the maintenance and improvement of the fertility of the land. Having maintained this position at all times we are at a loss to know why any reader who has carefully read The Missouri Farmer for any considerable length of time should misunderstand our position. But here is a reader who has surely read something between the lines we had not intended within them. He says: "I am considerably surprised at the stand you take, editorially, against fertilizers on page 8 of your March 15 issue. . . I also note an article on page 4 that takes practically the same position. I will be glad to know what has occasioned your change of heart?"

It is impossible in a short editorial to consider thoroughly every phase of any single question and as we referred to fertilizers in the editorial only in an incidental way in our discussion of the question of the relative value of strictly grain farming as compared with a combined system of grain and live stock farming it is possible our questioner if he was looking for information about the correct use of fertilizers may have failed to get our viewpoint in that article. That it is possible to maintain the fertility of land in a high state of production in a proper rotation of grain farming no one will deny. But to do so we must lose a frequent crop and turn it under to keep up the humus supply and must either supply animal manure or commercial fertilizers to replace the plant food taken off with the crops. To make such a system profitable, and without profit there can be no permanency, we think it is generally agreed by our best agricultural leaders and farmers that we must have lands not subject to loss from erosion, or must be near enough to a good market so that we can sell high priced crops and possibly have the advantage of buying cheap manures from city stables, stock yards, etc. This system calls for a large use of mineral fertilizers but under the conditions mentioned is entirely practicable as we have always maintained. The man who is acquainted with Missouri farms intimately, however, must admit that only a very small part of our farm land will come under these conditions. We have today probably as many acres in grass lands as we have of plowed lands but the best farmers will tell you we plow too many acres and that unless we grow more permanent pastures and stop the great loss of soil fertility by erosion that it will not be many more years until we will face a difficult problem of finding a way to farm these uplands with profit.

It is a generally accepted truth proved by statistics based on the experiences of hundreds of our most successful farmers that live stock farming, that is a system of growing crops and feeding to animals, is more profitable as a rule than strictly direct grain farming. Some years there is no direct profit on the grain and forage fed to live stock, in fact, it sometimes happens that there is a direct loss. If it were possible for a farmer to quit live stock raising quickly without loss and to take it up again at once when conditions changed it might be advisable for him to change from live stock to grain farming at any time grain would bring more on the market than when fed to live stock. But it takes time to get established in the live stock business and often if the farmer should force the sale of unfinished animals he might lose more than his loss will be in feeding them. The only safe plan to follow is to make a regular business of whatever branch of the live stock business he is in and stick to it through both low and high prices.

Another advantage of live stock farming is that the farmer can utilize his coarse feeds—the straw, corn stover, summer grasses—in a profitable way while if he was strictly a grain farmer and lived a few miles from the city about the only use the crops would have would be for turning under for manure. The intelligent farmer can readily understand that when he can get fifty cents a bushel for corn fed to cattle and hogs and by that system can keep his land up so it will yield fifty bushels of corn per acre that he is making more money than if he were to sell the corn direct at the same price, but by the grain system he should only get thirty or forty bushels per acre. Farmers know that the actual cost of marketing the grain fed to live stock is often no more than is the cost of marketing the grain direct, and if he is many miles from a railroad it may even be actually less. It takes but two or three hours to drive a bunch of cattle to the station while it would take a number of days to haul the corn and hay they had eaten.

But under the most careful system of growing and feeding live stock there is considerable loss if fertility is going off the farm with the animals sold and loss of manure before it gets back on to the land. There is no other way to make up for this loss except to haul it back on to the farm in the form of fertilizer. Farmers are learning these facts as shown by the increasing amount of fertilizers bought during recent years. According to reports of the Missouri Experiment Station fifty-four thousand tons of commercial fertilizer were sold in Missouri in 1912, fifty-eight thousand tons in 1913 and seventy-one thousand tons in 1914. We favor the use of commercial fertilizer to increase our crop yields but we think the best way to use it is in combination with all the animal manure that can be produced on the farm.

No experiment station has done better work to determine the correct and profitable use of commercial fertilizers than the station at Woocester, Ohio, under the able direction of Dr. C. E. Thorne. Based upon experiments running for many years, Dr. Thorne finds that a man farming 160 acres of fairly good land and after allowing for interest on the land and equipment, depreciation, cost of hired help and other expenses that he would have as his net profit or rather for his pay for his own time, $180 if the land is farmed in the ordinary way in a five year rotation of corn, oats, wheat, clover and timothy, and without the use of any fertilizer. This is the average of 18 years' results from 1894 to 1911. On the same kind of land and for the same time—18 years—an application of 320 pounds of acid phosphate per acre, 160 pounds on the wheat and 80 pounds on the corn and oats—at a cost of $15 per ton the amount the farmer received above the cost of running the farm was $560 or more than three times what the man had who did not fertilize.

In the above the farmer added only one elemnet, phosphorus. When potassium was added in the form of muriate of potash at the rate of 80 pounds per acre on the corn and oats and 100 pounds on the wheat at an increased cost of $1.78 a year the farmer, after paying all expenses, would have $600 for his year's labor—$420 more clear money than the man who did not use fertilizer.

Under the same conditions and covering the 18 years' trials, but when a complete fertilizer was used by adding 480 pounds of nitrate of soda, the cost for fertilizer was increased, but after paying the increased cost the farmer has a net yearly balance for his own labor of $642. Thus it will be seen that the use of fertilizer pays a good profit on its cost, but if it is used in combination with barnyard manure the amount of fertilizer necessary to be bought is reduced and the profits largely increased. With sufficient manure produced to apply eight tons an acre every five years and the manure then reinforced by 40 pounds of acid phosphate for a ton of manure the net income of the farmer was brought up to $1820. There is no longer any question about the profitable use of commercial fertilizers but the question is the proper use and this is what we are trying to keep before the minds of our readers.

ARE YOU BUYING FEED?

When a man can buy feed for growing or fattening live stock and get a profit on the transaction he is doing a good business because in addition to his direct profits he has the extra fertility the manure will add to his land. But when a farmer must buy high priced feed to feed ordinary work animals or merely to maintain young animals through the winter without gain hoping to get a profit on cheaper feeds in the future he is to say the least doing a hazardous business. During the three drouth years 1911, 1913 and 1914 millions of dollars have gone out of Missouri for Western alfalfa that could have been practically all saved if farmers had sown a few acres of alfalfa on their own farms. We say this with a clear understanding of the fact that there are thousands of acres of land in Missouri not suited to growing alfalfa, at least not in its present condition. But there are few farms in the state where at least a small field can not be found that can be made to grow alfalfa abundantly and with only ten acres of alfalfa on the average farm most of the money spent for hay during the last four years could have been saved to Missouri farmers.

There is another chance to save this enormous and unnecessary loss. There was enough corn stalks which went to waste on nine out of ten Missouri farms last year that had it been put in the silo would have taken the place of this high priced hay. The Missouri Farmer has published many letters and we have others awaiting publication from farmers who say that the drouth stricken fodder put into the silo doubles its value. You can almost tell where silos are by the condition of the cattle. A few men find fault with the silo but they are the ones usually who do not have silos.

Let's have it "a silo at every barn and alfalfa on every farm in Missouri."

CRIMSON TRAIL OF A NEW IDEA

(Continued from page 7)

rested and as a test she is taken to a pond and her hands tied behind her, and she is thrown into the water, for test of gilt. "If she sinks she is guilty: if she does not sink she is possessed of a witch." What could be clearer than that? If she was a witch she was tied to a stake in the market place and stoned to death. You think now such things never happened? Well, history records more unreasonable things, and done, no doubt, by well meaning folks, but just such has been the "crimson trail of a new idea."

Less than one hundred years ago some folks in Boston had a "new idea." It was that the state should pay for schooling the children, our modern free public school, if you please.

A meeting was called to start the movement, but the big taxpayers said "No, this is not fair; let those who get the benefits pay," (and some are still saying it are they not?) as a result officers were sent to the meeting, broke it up, arrested the leaders and put them in jail." Many a hard fought struggle marks the bloody trail of that "new idea." And some seem to make it clear that the war is not over yet.

Just a word and this chapter ends. This one is brand new just off the griddle. It is "Cheaper money for the farmer." It is having hard sledding. Many wise ones are now heard from with many dire and ill forebodings. Hear now, "It may be a dangerous thing for the farmer." It may mean woe to him." "He borrows too much money now." "He does not use wisely what he does have." Now, is not that mighty wise? Who but a "spring" Solomon could announce so great wisdom? Listen, let's make a diagnosis, and find the "nigger in the wood pile," the "bug under the chip" as it were. You see some have money to loan on farms, and you see why they might be prompted to utter such wisdom. Then it is contemplated taking all taxation off farm mortgages. "Ah, there's the rub." You see when farm mortgages are taxed the farmer who owed it pays tax on the land also on the mortgage or a double tax. Many mortgages escape taxation by strategy any way but to take the tax from them would have the effect of raising the tax a small amount on land but it would make land not mortgaged pay the same as land that is mortgaged, which ought to look fair to all except the wise ones. Then who else could object except the man who does not have any mortgage on his farm? or the man who would rather than pay his fair share, ask the man "blessed" with a mortgage to pay double? See that "bug under the chip?" The man who has money would not want his interest rates lowered, and the man with no mortgage on his farm would rather have the man who has, pay double tax rather than pay his fair share himself. See why the wise ones are giving us such great wisdom? Catch on? Oh! "The crimson trail of a new idea!"

S. M. Jordan.

BUCKSHOT BY THE PROFESSOR

Look up the advertisements in this issue. They contain a fund of valuable information which is worth while to every thinking farmer.

Nearly every spring I lose what little religion I've got left trying to scour the old plow. Guess I'll have to quit being a "hound dog" farmer.

One reason why I haven't got much use for the average politician is because he is so much harder on the seat of his pants than any other part of his clothes.

If old Saint Peter was as careless in selecting angels as a lot of farmers are in selecting seed corn there would be a pile of "misunderstandings" between Paradise and the realm of forked tails.

We had a mighty sensible Legislature this time. What did it do, you ask? Nothing of any consequence of course—but it had sense enough to adjourn, didn't it? That's what I liked about it.

If President Wilson will go off on a little vacation me and the Anti Horse Thief Association in my county will slip down to old Mexico and put that fellow Villa and Old Whiskers Carranzy out of business.

Suppose you give your boys a patch of ground this year and give them all they can make from it? If you don't want them to be street car conductors or soda fountain clerks in the years to come, now is the time to get them interested in the farm.

Why not hitch up your belt a notch or two, spit on your hands and try to land a "whale" of a crop this year? You've heard that old saying that the Lord helps those who help themselves? Well, get busy then. Put a little heart and soul in your work.

I am not very long on this fighting stuff but I'd just about as soon go up against those 42 centimeter contraptions over in Europe as to look into the long, sour face of a banker and ask him to loan me a hundred dollars for feed. From now on I am going to join the silo bunch.

It took sixteen janitors to keep the state senate clean during the recent session of the Legislature, Well, all I've got to say is that it must have been a mighty "mussy" place. Furthermore, my private opinion is that these janitors would have served their country better if they had been at home cleaning out the barn.

I am not very strong on this woman's suffrage business—but it gets my goat to hear a lot of old skin flints who put in most of their time whittling dry goods boxes and who can spit at a crack sixteen feet away and hit it two times out of three, saying that "wimmin ain't got sense enuff to vote."

Have you sent in that dollar to renew your paper yet—or are you going to let it get lost in the shuffle of oat sowing and plowing for corn? Honest, it seems to me that every farmer in Missouri ought to want to stand by The Missouri Farmer. In the first place, it's our "home farm paper." In the next place, it's as clean as a hound's tooth from beginning to end—and there is enough good stuff in every issue to make it worth a year's subscription.

Old "Josh" Simpson got "hoppin'" mad the other day. In fact, he was so mad he offered to "lick the whole durned outfit." Old "Josh" was busy telling a crowd of fellows down at the livery stable about a cat fish he caught back in the "spring of 61" that weighed over a hundred pounds and while he wasn't watching somebody took a bottle of "pizen" out of his overcoat pocket and substituted a bottle of harness oil for it. A little bit later old "Josh" got into a dark stall and "downed" about half of it before he discovered the difference.

Water Systems for Farms

Every farmer who is interested in a better water system should drop a postal card to the Aermotor Co., 1146 South Campbell Ave., Chicago, and ask them to send their literature. A postal card will bring it to you.

GRAIN COSTS TOO MUCH

To be wasted, but the average thresher wastes far more than many suppose.

The investment and labor which a farmer puts into his wheat crop is more than is usually conceded. His money investment in value of the land, cost of seed and implements brings the cost of his grain to a point where he cannot afford to waste it.

THE HIGH PRICE OF WHEAT

suggests saving it from wastage.

All this appeals to the thresherman the same as it does to the farmer.

THE RED RIVER SPECIAL

will save this wastage, making more money for both the thresherman and farmer. It beats out all the grain and puts it in the farmer's granary instead of into the straw stack.

A TEST THAT HAS LASTED 37 YEARS

I am the owner of a Studebaker wagon I bought in 1877 from a man by the name of Blauvelt, in Paterson, N. J. He bought it the year previous at the exposition in Philadelphia, 1876, making the wagon about 38 years old. It has been in use ever since and I am using it now.

Henry DeRonde, Spring Valley, N. Y.

His Studebaker came from the "Centennial," at Philadelphia in 1876

AWAY back in 1876—the year of the "Centennial" in Philadelphia—Dealer Blauvelt of Paterson, N. J., bought a Studebaker Farm Wagon there and sold it, a year later, to Henry DeRonde of Spring Valley, N. Y.

The wagon has been in constant use ever since, and is in use now—a long term of service for a wagon.

But Mr. DeRonde's wagon is a Studebaker, and long-lived Studebaker Wagons are found all over the United States.

Built for lasting service

You see, it is the way the Studebaker is built that makes it last so long. Air-dried wood, tested iron and steel, good paint and varnish, all count.

But the main fact is that Studebaker has been building wagons for 63 years and knows how.

Studebaker could not afford to build a cheap wagon. The motto of the house for six decades has been: *build not the cheapest, but the best.*

Any wagon salesman will tell you that a Studebaker wagon is built to last. And long after an ordinary wagon has been sent to the scrap heap a Studebaker keeps right on doing its work and earning money for its owner.

Suppose it does cost a few dollars more, isn't the increased life of a Studebaker worth it?

Studebaker Buggies and Harness are also built to outlast others.

Easier for the Shearer and better for the Sheep

Wool Means Money!

Why not get all there is from your sheep? You can easily net from **15 to 20 per cent more on every sheep** you shear with a **Stewart No. 9 Shearing Machine.** Don't labor with hand shears, in the old, hard, sweaty way. Don't have aching, swollen wrists. Don't scar and disfigure your sheep with uneven shearing and spoil the wool with second cuts. Take off the fleece **smoothly and quickly** in **one unbroken blanket** with a

Stewart No. 9 BALL BEARING Shearing Machine

It gets a length and quality of wool that will bring the highest price. The Stewart runs so easily a child can turn the handle while you shear. Extra profits soon pay for it. It's the most perfect hand operated shearing machine ever devised. Has ball bearings in every part where friction or wear occurs. Has a ball bearing shearing head of latest improved Stewart pattern. Price complete, including 4 combs and 4 cutters of the celebrated Stewart pattern, only $11.50.

Write for FREE catalogue showing most complete line of Sheep Shearing and Horse Clipping Machines.

SOYBEANS FROM A TO B

Q. Who should grow soybeans? A. Every general farmer in Missouri.

Q. Why? A. Because they produce well, and are among the very best feeds. They are wonderful soil builders, and they can be grown so many ways and in so many places, and in most all types of soil.

Q. In what ways may they be grown? A. They may be grown for seed or for hay or both. They may be grown in corn for silage, or for feeding off with sheep, lambs or pigs. They may be grown for pasture in many parts of the country after a wheat crop or an oat crop has been removed. Many Missouri farmers practice this. Sometimes they are grown to be plowed under for green manure. Sometimes they are sown between corn rows at the last cultivation, for the purpose of pasture, or for fertilizing the ground.

Q. When grown in the corn do they injure the corn crop? A. The average farmer will say no. The answer will depend on circumstances. They may do damage if planted too thickly. The number of seeds per hill should not be more than the number of grains of corn in the hill with them. If the soybeans do not gather nitrogen they would doubtless affect the corn the same as a weed.

Q. What is the advantage of having them in corn? A. They add nitrogen and vegetable matter to the soil, add to the amount of feed grown, also add to the quality of the feed.

Q. How do they add to the quality of the feed? A. Corn you know is not a very well balanced ration, and it is low in protein, the most expensive food element. Soybeans are rich in protein hence the two combined make a most excellent feed, and a well balanced one.

Q. What do you mean by a well balanced feed? A. You are really out of order on the query, but since it is you, I will tell you that a balanced ration is one that feeds or nourishes all the body in the right proportion.

Q. How do you plant them in corn? A. The best way I know of is with an attachment to your corn planter. There are attachments made for this purpose.

Q. How many per hill and how deeply should they be planted? A. Not more than as many soybeans per hill as you plant grains of corn. You must not plant very deep, as they may not come up. Many farmers have gotten poor stands by too deep planting. Two inches is deep for them, from one to one and a half inches will be better.

Q. How many soybeans per acre will be needed? A. That depends on the variety you plant. Seeds of some varieties such as the Peking are so small that by putting 3 per hill 3½ x 3½ feet a bushel will plant about 30 acres. A bushel of Mammoth Yellow, one of the largest, will plant from 12 to 14 acres.

Q. What do the seed commonly cost? A. From $2 to $3 a bushel.

Q. If you plant between rows, when and how should that be done? A. You will need to lay your corn by a little earlier than you commonly do or the soybeans may make very little growth, and a one horse grain drill made for such a purpose is the best way I know of. Stop up some of the holes leaving open as many as you want rows.

Q. How many holes would you suggest be left open? A. I would say from two to three.

Q. Will a person always get good results by this method? A. No, perhaps 3 or 4 times in 5 you will get good results. Much depends on when you get them sown, on the soil and the season.

Q. You spoke of pasturing the soybeans in the corn. Tell me about that? A. You may turn lambs or pigs into the corn and soybeans when the corn is about ready to cut for fodder, and the soybeans are ripening. They will not eat any corn except a down ear. Pigs up to 60 pounds may be used. Lambs and sheep will also eat the corn blades as high as they can reach and this is why they should not be put into the field while the blades are very green as this may result in soft corn. Old sheep will eat some of the corn but they do not waste any, and how they do lay on the fat! It is a fine plan to let your fattening hogs and sheep right in the ripened corn and soybeans and allow them to harvest the entire crop. They save you hauling the manure back to the field, they get fat faster by doing their own feeding. They do not charge you 4 or 5 cents a bushel for husking your corn, they have more time for it than you do, and no doubt like the job better than you do.

Soybeans on farm of J. R. White & Son, Lawrence County, Missouri. A crop profitable for seed, for hay and for green manuring

Q. How many head per acre may be used? A. Oh, that depends on the size of the crop, but of sheep a fair average might be from 8 to 10, and half as many more lambs, and hogs about the same. You know some times you like to get the pasturing done quickly and this of course must be considered.

Q. Would you feed the hogs tankage when they are feeding on soybeans? A. Why, no, soybeans come almost as near the value of tankage as does tankage itself.

Q. You said something about soybeans in the corn for silage. Tell me more about that? A. Suppose your ground under fair conditions should make 30 bushels of corn per acre or say 5 tons of silage. In a crop of this size you can get from 1 to 3 tons per acre of the soybeans silage in addition or a total of from 6 to 8 tons per acre instead of only the 5 tons of corn silage. The combination should have a feed value of perhaps from 10 to 25 cents per ton more than the straight corn. This is considerably more than the seed will cost, and this is the only cost, and I have not here considered the extra nitrogen put into the ground by the soybeans.

Q. What variety of soybeans would you recommend? A. Oh, that depends a lot on what use you mean to make of the crop. For the silo I like the Jet, the Medium Yellow, and the Mammoth Yellow. The Mammoth Yellow often will not mature seed as far north as central Missouri, but the other two will. These sorts grow tall and are also best for hay or pasture. Mongol is the heaviest seed producer that I have tried, and the Mikado comes next, Medium Green is a fair seeder, matures rather early, but the plants are short. This is a good one for the pigs. The Ito-San is the earliest I know of and it is a very good sort. The Peking is very good also, and is said to do better in poor soil than most others.

Q. Are there other any other varieties? A. Oh, my, yes, there are dozens of them. Among the best are the Wilson, Holly Brook, Early Black, Auburn, Morse, etc.

Q. How should they be planted to grow seed? A. Best on medium soil, well drained and drilled about 28 or 30 inches apart and one or two inches apart in the row. If the rows are closer the plants do not do so well as they can not stand crowding too much. Planting the rows closer requires more seed but does not produce more of either seed or hay. For hay they may be drilled solid with a grain drill at the rate of one bushel to the acre.

Q. Do they need to be cultivated? A. Yes, but it can usually be done with a harrow. The beans are deep rooted and do not pull up easily after they are 4 or 5 inches high. Harrowing about three times is usually enough. This of course will depend on the season, the soil, and how foul of weeds the land may be. Always slant the harrow teeth back well, and keep them clean, and be sure not to go into the bean field to work them when the ground is wet, or when the plants are even damp with rain or dew. WAIT TILL THEY ARE ENTIRELY DRIED OFF.

Q. When and how should they be harvested other than pasturing? A. If hay only is the object a good time is when the pods begin to turn yellow or the lower leaves begin to fall. For seed, the pods should be further matured, but not fully ripe if they can be allowed to ripen after cutting. If allowed to be fully ripe the beans shatter badly sometimes. Some varieties are worse for shattering than others. The season also has something to do with this. Some machinery that will bunch them is best. They may also be cut with a binder and fed in the sheaf.

A clover buncher on a mower is good, sometimes a binder is used, sometimes binding them and sometimes not. The old time self-rake is finer for harvesting soybeans. When they are cut with the mower and left in the swath for a few days the stems settle among the stiff stubbles, and many beans will shatter and much of the hay will not be taken up with the rake.

Q. Does frost kill the green soybeans? A. Yes. They should always be harvested before frost. Watch the weather some, too. They are rather hard to cure. Too early planting in the spring often causes failure also.

Q. How much hay will they produce per acre? A. That depends on many

The Agency of a United People

A striking comparison between a homogeneous country and a heterogeneous group of countries is obtained by placing over the map of the United States the map of Europe. These represent the same area—about 3,000,000 square miles—if a few of the remote provinces of Russia are omitted.

Europe has the advantage in population, with more than four times as many people as the United States; in the number of large cities, with two and a half times as many cities of over 100,000 population.

Yet the United States, a comparatively young country, has outstripped Europe in the diffusion of civilization, because of its wonderfully greater means of communication between all parts of its area. The United States not only excels in transportation facilities, but it has nearly three times as many telephones as Europe, or about eleven times as many in relation to population.

By the completion of the Transcontinental Line we now talk from one end of this country to the other, while in Europe the longest conversation is no farther than from New York to Atlanta, and even that depends on the imperfect co-operation of unrelated systems.

Europe, with twenty-five countries and many different languages, serves as an illuminating contrast to the United States, with one language and a homogeneous people, despite the fact that our population has been derived from all parts of the world.

During the last forty years the steadily extending lines of the Bell System have contributed in no small measure to this amalgamating of different races.

The latest achievement—the linking of coast to coast—has given greater force to the national motto, "E Pluribus Unum."

No Matter What Separator You Think of
Get This Great Free Book First

A postal brings you the Great Western Separator Book. It puts you under no obligations to us whatever. We are glad to send it to you, whether you buy a Great Western or not. But the book *does* give you valuable information, not only about the

Great Western Cream Separator

but how to *get more cash profits from your cows.* Written by experts. Illustrated by pictures from actual photographs.

Great Western follows nature's law—cream from top—milk from bottom—gets all the cream. Imported ball bearings throughout. Self-draining bowl. Low tank, high crank. Lifetime durability. Simplicity itself. Send for book today.

ROCK ISLAND PLOW COMPANY
553C Second Street, Rock Island, Ill.

conditions but perhaps from ½ ton to 4 tons.

Q. How many seed per acre may be expected? A. That too depends on the soil, season, and variety. Field yields often run from 8 to 25 bushels.

Q. How does a bean crop compare with our oat or corn crop? A. Well, let's figure a minute. When corn is worth 60 cents for feed, soys are worth at least 90 cents. Soil that will grow 40 bushels of corn per acre, should grow 16 bushels of soys per acre. Suppose the growing of the two costs the same, while in fact to grow the acre of corn will cost more.

40 bushels of corn at 60 would give us 24.00
16 bushels of soys at 90 would give us 14.40
and we should get at least 1 ton of hay at 10.00
and the corn stalk field at ..... .50
would give us 10 cents in favor of the 40 bushels of husked corn. But wait a minute. I was about to forget to tell you that the beans should leave from $3 to $5 worth of fertility in the acre of your soil.

Q. Will the beans always put nitrogen into the ground the same as clover? A. No, your ground may not be inoculated.

Q. How can I tell when they may be doing my soil any good? A. Dig some of the plants up carefully and if they are gathering nitrogen for you, you will find little nodules on the roots much like those on clover roots only considerably larger. Examine them for nodules when the crop seems to be about half grown.

Q. How can the soil be inoculated? A. By sowing soil from a field that has been inoculated or by inoculating the seed with bacterial cultures.

Q. Will it pay to inoculate? A. If the ground is not inoculated, beans can not gather nitrogen from the air, and the ground is not benefited, and usually you get smaller yields of both hay and grain.

Q. Is soybean hay good feed? A. Almost as good as alfalfa.

Q. Oh, yes, I forgot to ask how many seed per acre are required for seeding for hay or seed? A. A bushel should plant from 3 to 5 acres, if drilled in rows. If drilled solid about one bushel to the acre is needed.

Sam Jordan.

PRACTICAL FARM PAPERS

Brethren, I can have no better text for this discourse than the issue of Missouri Farmer of March 1, '15. Last week I drove past three tenant houses on the old Lyon farm—my greatgrandfather' land—1000 acres. At every stable barn I saw the remains of what had once been fine manure piles, in some cases manure three to ten years old, part of it over the creek bank.

I also saw fields on that farm, where the best known system of cultivation would not produce twenty bushels of corn or ten bushels of wheat per acre—tenant system. Then I passed on to a ten acre field that I remember as being called worn out fifty years ago, and where the owner said he had 75 bushels of corn per acre in dry 1914. This part of my text from Hap-Hazard-Methods.

"Farmers need organization," now, says Mr. Ellis, the editor, and going back some seven years I can recall the labors of a few score of men, who within a year's time, succeeded in bringing the price of tobacco from 7 cents per pound, a dead loss to the grower, to 14 cents a pound or a neat profit. Then I remember how the organization was allowed to go down, and how the 1914 crop sold at less than 7 cents per pound, and the question came to my mind, "If organization would secure profitable prices on tobacco, not a food product, what could it do with wheat, and hogs, and corn and beef?

I have been a member of the Grange since 1874, of the Farmers Union and the Society of Equity for a short time and I see grand results from the work of all of these, but the farmer needs an organization that is closer than any of these. It is not enough to know how to produce a maximum crop, we must learn how to sell this crop at a profit, and only through close organization can we do this. Co-operation between producer and consumer must be secured, and the middle man eliminated, only in so far as he practices extortion in prices that he establishes. A year or two ago I had the chance to follow a plain old Plymouth Rock hen, from my wife's hen house to a city table, as I know the commission man, the poultry dealer and the man who bought the hen for his Sunday dinner. She was one of the coop of twenty fowls, averaging five pounds each. The railroad charged at the rate of 3 cents each for hauling the coop forty-two miles, the commission man charged 4 cents each for selling and delivering to the dealer. My wife got 60 cents each, and the man who ate the hen paid 95 cents for her, for he told me so. It would be just as easy to locate other cases of extortion as this one, if producer and consumer get together.

Our county paper will re-publish "What Shall We Teach Our Boys and Girls; and suggest that our schools take up the "Johnson County Idea."

Writing from a section where there has been no hog cholera since 1862, I will not comment on Dr. Connaway's article, but will again state very briefly, that a complete "cut out" of all hog raising in infected districts, said cut out lasting two full years, is a plan worthy of a trial.

Clover and Fertility, by my good friend Krusekopf, is an excellent presentation of the merits of clover. We will sow our clover seed in early April, and will harrow it in, laying the harrow nearly flat to avoid injuring the wheat. The clover seed sown on oats will be sown after the oats are drilled, and lightly harrowed in.

Take up Missouri Farmer March 1, and read all of the editorial page again. Remember, that if our law makers meet and adjourn, without ever hearing from us, we can expect little from them. You know your member, and if you and fifty others from your county will write him personal letters, it will be a great help in securing needed legislation. But, my space is full, and I have only touched on a few things given our readers in one copy.

Can a Missourian afford not to take such a paper, one that can be had three years for one dollar, or a little less than 1¼ cents per copy? Get up a club old friends, for I know that I am writing to hundreds of men whom I have met.

C. D. Lyon.

THE SUMMER VACATION

This term has several meanings when applied to the rural schools. So far as the school plant is concerned it means a period of rest and decay. Rest from the tramp of feet, the noise and activities which characterize these schools. Decay, in the sense that there is general neglect which gives the impression of abandonment. The yard is usually covered with weeds, the well is left uncovered, the window screens are off or hang by one hinge, the door stands open and the house becomes the home of birds, bats and hoboes. So much from a material standpoint.

To some parents, vacation means a period when boys and girls will take a larger part in the daily duties of the farm and home. In communities where labor is scarce, the vacation is a very important economical matter. In other homes where help is not such a problem vacation means a period of more home worries and responsibilities. During the school term the teacher divides these honors with the home, but during vacation it is centered in one place. Some homes look forward to the opening of the school as a time of temporary relief, while others regret that it comes so soon.

To the teacher vacation may have several meanings. It may mean a final adieu to school work. Marriage or something else will take its place. It may mean several weeks spent at home,at a summer resort or elsewhere, simply resting. It may mean close, intense application in a summer school making larger and better preparation for school work.

Finally, what does vacation mean to the average pupil? Freedom. Whatever may have been the love for the teacher, however interesting and successful may have been the school, still, the average child counts the days until the close and looks forward to that time with a feeling of peculiar delight.

The reason for this feeling on the part of the child is not difficult to understand. During the fall and winter months, he has spent most of the day in the school room. As much as it may be regretted to make the statement, still it is true that the average school plant is not an attractive place for the normal child. The poor heating, lighting and ventilating, the uncomfortable desks, the lack of good sanitary conditions, of suitable decorations, well selected library books, of organized games and plays and last, but very important, the lack of a room or place for some form of manual work, all these conditions do not cause the average, normal minded child to fall desperately in love with the school house. There is little wonder then that he looks forward to vacation as a time when he will be free to roam in the open air, to climb trees, wade in brooks, tramp through the woods and thus to commune with nature.

We have all noticed that when pupils return to school in the fall, they seem to have forgotten everything that they had learned the year before. A new teacher can easily escape from the difficulty by placing the blame on her predecessor, but for the one who holds over and who is sincere in the work, it becomes a matter of some little surprise and humiliation.

The truth is the child has been living in close touch with nature and has neglected his books. He has dealt with things and in some way there seems to be no relation between these things and his text books.

This brings us to several important questions. Why should there be any seeming break in the child's education during the entire year? Why should not the experiences and activities of the summer vacation correlate with the school work during the fall and winter? Why should not the regular school work prepare the child for a larger, keener and better appreciation of his environments during the summer vacation? Why should not one period naturally supplement the other, making it richer, more interesting and full of meaning? Why should there not be in reality a rural school extension course, for which due preparation will be made in the schools during the fall and winter and worked out during the summer vacation?

The writer believes this is possible. Not only is it possible but it could be easily done. It might cause some of us to change our notions, but what of that? It might cause some changes in the course of study, some changes in the program, some changes in the preparation of the teaching force, but these things would be easily adjusted when once we began the solution of the problem. For one, the writer would welcome the change.

R. H. Emberson, Columbia.

The Kodak on the Farm.

EVERY live thing on the farm is worth a photograph—and just now when chicks and lambs and calves are arriving so rapidly is a most interesting time to start a Kodak record—such a record often becomes more than interesting, it becomes a business asset.

Picture taking is very simple by the Kodak method and less expensive than you think. Ask your dealer or write us for our new booklet, "The Kodak on the Farm."

RAISE BIGGER CROPS

My New No. 8 Low Down Manure Spreader

used now means bigger crops next year. You know this yourself. Manure spreading time is all the time. This new No. 8 Low-Down Manure Spreader is Galloway's greatest spreader.

Positively the best spreader made for the least money. Double chain drive, endless apron; force feed; front wheels cut under load; gets into any barnyard corner; close hitch; lightest draft of any low-down machine. Capacity 60-70 bushels. All steel gear, complete with double-trees and neckyoke. Flexible rake; high speed beater pulverizes finely any barnyard material. Steel wheels; gears coupled with channel steel, trussed like a steel bridge. Box rests on rear trucks, 42 inches high. Superior in every respect to new fangled freaks of heavy draft that eat you up for repairs, annoy you and kill your horses.

K. K. Foust, Ashley, Ohio, writes: "Please find draft for spreader received October 5th. Assure you I am more than pleased with same. It has proven all you claim and more. By buying of your company, I saved $21.80 and got just what I was looking after."

My Book "A Streak of Gold" FREE

tells all about handling manure to get the greatest profit. Do not buy a spreader of any make at any price until you have dropped a postal asking for this great book worth $1.00 (costs you nothing) and my BIG SPECIAL SPREADER CATALOG that tells the truth about the spreader business. Mailed free. Get RIGHT on this spreader proposition before you buy.

EASIER TO OWN ENGINES NOW

The new 1915 sales plan which has been put into effect by Ed. H. Witte, of the Witte Iron Works Co., Kansas City, Mo., is a new step of advance in the kerosene and gasoline engine industry. Witte now sells direct from factory to user, and has arranged for easy payments, so a WITTE engine can earn its own cost while the user is paying for it. For twenty-eight years Mr. Witte has done nothing but build WITTE engines.

Ed. H. Witte

His catalogs and circulars, together with the prices he makes, show he is a master at his business. The Witte factory is one of three of the first gasoline engine factories in America, and is now the oldest and largest exclusive engine business, selling only direct to the user. Mr. Witte has just brought out his new handsome catalog in three-color printing, the title of which is "How to Judge Engines." The text matter with the many pictures and drawings shows in a convincing manner that a WITTE engine, using either kerosene, gasoline, gas, naphtha or distillate, is a competent "hand," suitable for any work that can be harnessed to a belt. The striking part of this showing is the really low prices that are made on all sizes of these engines, from 2 to 22 horsepower, stationary, portable skidded or saw-rig styles. These factory prices mean a saving to purchaser of anywhere from $25 to $250, according to the size and style of engine selected—a 6 horse power stationary engine, for instance, selling at $97.75 for the complete outfit, all ready to run as soon as unloaded at destination. The 60 days' free trial plan is also explained in connection with the liberal 5-year guaranty, which Mr. Witte makes very definite and broad. Your name and address, sent to Mr. Witte at his factory address, 1840 Oakland Ave., Kansas City, Mo., will bring to you one of these new catalogs, free, together with his new Easy Payment Sales Plan. OLD-FASHIONED THINGS

There is a charm about old-fashioned things;
Grandmother's spinning-wheel, her Paisley shawl,
Her candle molds, her quaint, old-fashioned rings,
The tall old clock that used to guard the hall,
The andirons and the old blue willow ware,
The highboy and the old carved rocking chair.

And grandma, too, we feel was part of these,
As charming, quaint, and yes, as antiquate;
Forgetting 'mid our new facilities,
That grandma, in her day, was up to date,
And used her candle-molds and goose-quill pen
In lieu of better tools undreamed of then.

And we forget our own grandchildren may
Smile in superior fashion at the sight
Of many things of which we're proud today;
Our telephone, steam heat and Tungsten light,
And sigh a bit and wonder as they laugh
At our dear, quaint old-fashioned phonograph.

—Walter G. Doty in Farm Journal.

HOME MAKERS' CLUB OF CAMP BRANCH SCHOOL 51

Miss Bab Bell, during one of her visits to this district, enthused us with the idea of forming a Home Makers' Club. After some favorable discussion we organized with the following officers:

Mrs. R. V. Denny, President.
Mrs. M. J. Clifort, Vice-President.
Miss Ona Upston, Secretary.

The Camp Branch School, of which Miss Julia C. Sullivan is the teacher, was the first school in Pettis County to install the domestic science department.

They hold their meetings on the third Wednesday of each month at the home of the various members—alphabetically arranged. At each meeting we take up two topics outlined for Home Makers' Clubs—which are sent out from Columbia on request.

Though we have been organized only a year, the district feels that many benefits have been derived from these meetings and that much of the success can be given to the untiring efforts of the President and her able assistants. The club now has twenty-four members but they do not intend resting until all the ladies of the Camp Branch School District have united their efforts and interest with them and thus the true spirit of progression will be encouraged and results will show the closer tie between the rural home and school.

How I Won My Trip to Columbia for Farmers' Week

Last spring our Farm Advisor, Mr. C. M. Long, suggested and urged that each township in our county send a boy and girl to Farmer's Week. He also suggested that the girl who made and exhibited the best middy blouse in the township in which she lived should win the trip offered to the girls in that township. Jackson township, in which I live, responded to Mr. Long's suggestion.

Our township holds an annual fair, and it was decided that the girl exhibiting the best middy at that fair should be awarded the trip. I determined to put forth my utmost efforts to win that trip. I purchased some white linen and trimming for a middy, which I cut and made by myself and then exhibited it at the fair. My joy was made complete when the blue ribbon was placed on my middy and I knew that the trip to Columbia offered to a Jackson township girl was mine. As I was a member of the Jackson Township Improvement Club, which furnished the money for my trip, I was also asked to act as their delegate to the Home Makers' Conference.

A lady of our immediate neighborhood intended to attend Farmer's Week, and I planned to go under her care but on account of illness she was detained at home, however, my mother asked Mrs. Redford, one of our Johnson County women, whom we had met at the "Round Up" to chaperon me. Mrs. Redford kindly chaperoned all the Johnson County girls—at Mr. Long's request, and we certainly did appreciate her care and thoughtfulness of us.

It is hard to give a true conception of what it means to a girl to attend Farmer's Week, as well as to the women. We were shown how to arrange the furniture and utensils in the kitchen to the best advantage to save steps and time; how to select the food and cook it properly, also how to judge clothing material and sew after the material is purchased. The contests held for girls at Columbia are most helpful and I am sure that we learned much from them; really the ones that did not win learned the most, for the others were putting into practice what they really knew and the rest gaining the instructions.

Tomato raising by girls was proven to be a money making proposition—one girl in Jackson Township won a silver trophy at Columbia besides having cleared over forty-five dollars off one-tenth of an acre of land planted to tomatoes. We also heard discussed two most interesting and important subjects, "The raising of pure bred poultry and why better than a mixed flock," and "Beautifying of the Farm Home." The first topic is always interesting to most women and girls, for most of them are poultry raisers to some degree, though many of them are satisfied if they obtain enough eggs for cooking purposes together with a few dozens to sell each month from a large flock of mongrel hens.

At Columbia the girl is encouraged to start right by securing some pure blooded fowls. The motto given her was "Only the Best is Good Enough for Me," and to help build up the greatest of all Missouri industries—the Missouri Hen.

It was a great pleasure to meet and converse with people from all over the state and get acquainted with our University at Columbia. We were impressed with the fact of how much more people can accomplish through organization for both social and financial reasons, and surely Farmer's Week should inspire all to organize from securing the results of others. This organization is just as vital for the girls and boys, for in a few years they will be the burden bearers and now is the time to prepare for their future responsibilities.

I hope that many more girls may have the pleasure and benefits from attending Farmer's Week in 1916 for in my opinion, no woman or girl could better invest ten or fifteen dollars—according to the distance she may live from Columbia—than to attend Farmer's Week and we shall be interested in hearing of the successful contestants that will be there next year.

Ruth Ballard, Johnston County.

Johnston County to the front again—let us hear from Jackson County next.

PURE-BRED POULTRY

(Written for Home Makers' Conference)

Why not pure-bred poultry on the farm? This is a question that every up-to-date farmer should ask. In many city lots we see a flock of pure-bred poultry. If they are profitable there they should be doubly so on the farm.

It is true enough that there are many flocks of pure-bred poultry on Missouri farms, but on the other hand there are many farms where you see only a mottled lot of mixed birds.

If pure-breeds are profitable in other lines of live stock, why not in poultry? Not so many years ago a large majority of our farmers raised scrub or grade cattle, hogs and sheep. There are comparatively few farmers today but will point with pride if only a trace of pure blood runs in the veins of their animals. Many are using pure-bred sires or parent stock and consequently have better quality which adds greatly to the appearance of stock and all surroundings.

Statistics show that the products of the Missouri hen have outstripped the Missouri mule, that the poultry products of Missouri are twice those of the annual wheat crop and half as much as the annual corn crop. The Missouri hen produces $10,000,000 more wealth annually than all the cattle sold in Missouri. Then does it not pay to have the best quality of stock and to devote a little more time in caring for it?

The reason all Missouri farmers do not have pure-bred poultry is no doubt because the matter has not been given proper consideration.

You have seen beautiful country homes where the owners tolerate a bunch of scrub chickens. Picture to yourself how much a flock of pure-bred birds would add to the surroundings. It is not beneath the dignity of any man or woman, no matter how well stationed in life to at least supervise the management of a flock of pure-bred poultry, even if they do not care to do the work. Aside from this why shouldn't the busy farmer's wife have the very best to be had in the poultry line? Busy as she is, the work would be easier for her if she had something to be proud of. Not only this—she is usually working for a profit out of the flock as well as plenty for home consumption. One takes more pride in a pure-bred flock and therefore gives it more care, and of course that means more profit. Pure-bred stock are easier to get in shape for market and usually lay a greater number of eggs and eggs which are of a uniform color.

Not long ago while I was talking to a friend, trying to induce her to dispose of her scrubs and raise pure-bred stock, she replied, "Why, I haven't time to go to the shows." Raising pure-bred stock by no means necessitates going to the shows. I would not urge any woman to go into the business making a specialty of show stock, unless she had a special

DINGEE ROSES Sturdy as Oaks

Our roses are strongest and best. Always grown on their own roots. More than 60 years of "knowing how" behind each plant. Safe delivery guaranteed—our guide explains. No matter where you live, you can *depend* on getting D & C roses in perfect condition. Write for

1551 Railway Exchange Bldg, St. Louis, Mo.

liking for the work. However, I do urge you to take up pure-bred stock from a business standpoint, to say nothing of the pleasure you will get out of it.

It has been shown in egg-laying contests that it pays to breed for egg production, and we know this can be done and not lose sight of the beauty of the particular variety you are breeding. On the other hand it is not necessary to breed for beauty alone.

One woman said, "I want my chickens mixed. I can tell old 'Spec' every time she goes on the nest to lay and if I had all one kind I wouldn't know which one was laying." It is often counted by one when you have a mixed flock—not that some mixed flocks do not lay any eggs, for some seem to produce a large number of eggs, but there are more pure-bred that are heavy producers. It is easy enough to distinguish the best specimens if one is at all familiar with his flock—even if they are all one kind.

A number of farmers, whom I know of, are purchasing pure bred males each year. They have no definite aim in view, other than to cross breed. This is a better way than just "swapping" roosters—the system that was used in an earlier day. They will buy, say three Wyandottes, two Langshans, perhaps two or three reds or some other variety. We feel they are almost wasting their money when they pay any great amount. How much better if they would decide on one variety and buy all of that kind! There are a great many breeders who are making a specialty of pure-bred stock. Eggs for hatching may be had for from $5 to $10 a hundred from range flocks? In this way one can get a nice start of pullets. This is an easy way. However, you should always study the catalogue for just what quality you think will suit you best and always buy the very best you can afford. A quicker way is to buy a pen of birds—say four females and one male. You can get them for $10 or as much higher as you wish to go. It all depends on the quality you want.

Last year a woman, who had formerly had Langshans but had mixed them with other varieties, came to me for a breeding male. She still had some pretty fair hens. She penned the male with eight or ten of the best females she had. The other day she called me and wanted another male to go with the best pullets from that mating. She said she had one hundred fine pullets and had sold about eighty chickens from the mating. She felt it had paid her. I give this as an illustration to show how quickly you can get a start. We ought to have on every farm in Missouri a flock of pure-bred poultry. Missouri is now poultry queen and we want her to keep this high rank. If this message turns only one person's attention to pure-bred poultry, I will feel repaid for having given it, for if one person in a neighborhood has pure-bred poultry, others will soon follow.

Summing up the advantages of pure-breeds: you get pleasure, profit and beauty. Then why not pure-bred poultry on every Missouri farm?

Mrs. Jas. A. Staples,
LaMonte, Mo.

Prizes for Canned Vegetables

Mr. and Mrs. J. Ed Hall of Lamonte, Mo., are offering through the Missouri Homemakers' Conference, a $10 trophy or cash, to the young woman in the state who will most successfully can six jars of different vegetables in pint jars, these cans to be exhibited and scored at the January, 1916, Conference. This is the most liberal offer for culinary product that we have ever seen and fortunate is the young woman who wins it. This offer seems especially to appeal to those young people who have passed beyond the school club—and while the dream home of every normal woman is still in the future—why not improve the present, which is ever full of time and opportunity, to get the proper training while near mother? We shall be glad to hear from all who are interested and wish to enter this contest; it is full time to start your seeds.

The following vegetables are possible to have on your table the year 'round and yet not have to purchase them from the grocer: Peas, Beans, Spinach, Swiss Chard, or any wild green, Asparagus, Corn, Tomatoes, Summer Squash, Egg Plant, Lima Beans, Okra, Beets, Cauliflower and Carrots.

The Farm Home Beautiful

The front yard of the average farm home could be made much more beautiful if more attention was paid to planting a few rose bushes here and there and The Missouri Farmer wants to appeal to every housewife in whose home it is a visitor to make this spring the occasion for beautifying the home premises in this respect. Few people realize what a dollar or two will do in the purchase of roses—and once planted they are a joy forever—growing more luxuriant and beautiful each year. At the present writing there are more than one thousand varieties of roses being grown in the United States—and hundreds of them are perfectly hardy and will withstand the coldest winters. To begin with, there are the beautiful rambler roses which in two or three years will cover your entire front porch—or, if you prefer, arbors can be built for them in the front yard. Among the hardy varieties is the Crimson Rambler, famous throughout the Country. Then there are the American Beauty and Paul Neyron ramblers—some of the later varieties which bear a world of gorgeous roses—many of which are three inches in diameter. Then there are dozens of beautiful bush roses which bloom the whole summer long—furnishing a world of beautiful flowers from early spring until frost in autumn. Elsewhere in this issue will be found the advertisements of several rose growers and we hope you will drop them a postal card and ask them to send you their catalog. Why not make your front yard a thing of beauty? Why be content with a few indifferent roses for only a week or two in the spring? Why not have a lot of gorgeous roses which will grace your table and fill the house with perfume the whole summer long? Look up the rose ads.

Farmer Girls, Attention!

Would you like to earn a beautiful diamond ring, a lavalliere or a handsome wrist band watch? If so, we shall be glad to tell you how you can do it during your spare time. Write us at once for full particulars. Address, William Hirth, Columbia, Mo.

Something New in Silos

The W. S. Dickey Co., 202 New York Life Bldg., Kansas City, Mo., is putting out a new tile silo which is attracting a great deal of attention. A postal card will bring you full information.

Motorcycles on the Farm

On the last page of this issue will be found the advertisement of the Indian Motorcycle—undoubtedly the greatest motorcycle on the market. Hundreds of these machines are being purchased by farmers these days both for pleasure and utility for they are the greatest destroyers of distance ever invented. When you need to make a quick trip to town on some errand—or when you want to take a long spin for pleasure—the motorcycle is the thing. If you are interested drop the company a line and mention The Missouri Farmer.

Interested in Automobiles?

If you are interested in automobiles you should drop a postal card to the Studebaker Automobile Co., Detroit, Mich., and ask them for their big catalogue. They are putting out two of the finest moderate priced cars on the market—and they are big, roomy dependable cars built expressly for farmer families and built to last. Every farmer in the Country is familiar with the Studebaker farm wagon which has been the standard for years. The Studebaker automobile is manufactured by the same people. Write them for their big handsome catalogue if you are interested. Be sure to mention The Missouri Farmer.

Believes in Our Plan for Farm Organization.

I have been reading your plan of farm organization and I will say that I am in full sympathy with the move. The world has to depend solely on the farmer but some people don't want to give him a bread and butter living for his work and investment. The commission men and most everybody else told us last fall that fat cattle and hogs would be higher than a tree in the spring. But now they are very cheap, and there must be a nigger in the wood pile. I will say the time has come when Mr. Farmer will have to awaken to the fact that unless something is done that it will not be long until he will be no more than a slave in bondage! Keep pushing this good move along and see what can be done. Yours for universal peace.

C. H. Scruggs.

Think of a splendid, clean paper like The Missouri Farmer for three years for one dollar—or only 33⅓ cents per year? Doesn't it seem that every thinking farmer in the state would want it at that price?

Better look over our classified columns and then send for a setting of purebred eggs to get a start of better stock.

Edgar Dooley Etterville, Mo.

LIVE STOCK NOTES

By R. P. Royce, Fieldman

Yorkshires—the Bacon Hog

Readers will find it to their interest to look up the advertisement of Frank Gildow, of Jamesport, Mo., in which he announces that he is closing out his entire herd of large Yorkshires—the acknowledged bacon breed.

It will be recalled that the firm of Dr. John Gildow & Sons recently held a dispersion sale of Poland Chinas. Messrs. Gildow also maintain a small but select herd of Yorkshires. Several years ago they purchased a Yorkshire sow just to furnish their own supply of bacon. The experiment proved so satisfactory that they added several other sows and a boar, and have since built up a nice trade among those who wanted to improve their bacon supply. The foundation stock was secured from the leading herds in the United States and the young things now offered are of the same breeding. In a recent letter Mr. Gildow has the following to say: "Our initial purchases were made from the three most prominent herds of the breed. The offering includes the grand champion boar and sow of the 1913 Missouri State Fair, and practically all of the older animals are State Fair prize winners. For the benefit of those who are not familiar with this wonderful breed, I will say that the Yorkshire is by odds the greatest bacon breed in the world. They grow very large and are noted for their prolificacy."

J. D. Blackwell, of Fayette, Mo., offers well bred registered Aberdeen-Angus young cows with calves at foot, also two-year-old heifers due to calf in early spring and summer, yearling heifers and good yearling bulls ready for service, at farmer's prices.

Clelland's Galloways

J. and W. R. Clelland, New Hampton, Mo., who advertise Galloway cattle in this paper, are among the oldest breeders of the state and the herd they maintain is first-class in every particular. This firm is now offering a nice lot of young bulls and heifers as well as a number of good sows—some with calves at foot and others due to calve soon. Most of the young stuff is sired by one or the other of the two herd bulls, Flagstaff by The Chief 2nd, or Sallie's Othello. If any of our readers are interested they will find it to their interest to write Messrs Clelland.

D. L. Sutherland & Sons advise us that their cattle have come through the winter in good shape and that they have a cracking good bunch of young bulls and heifers they can offer the trade at very reasonable prices. The Sutherland herd has been established for over thirty years, and it has been a big factor in the success of the Sutherlands. Now is a very opportune time for any one to get into the pure bred cattle business and there never was a time when the outlook was better. Look up the Sutherland ad and write them for prices.

Report of Chas. L. Taylor's Sale

Chas. L. Taylor held his first public sale of Durocs at his farm near Olean, Mo., Tuesday, February 23, and made an average of $44.50 on fifty head. While Mr. Taylor expressed himself as fairly well pleased we will say that such an average was at least $15 per head under what such an offering should have brought. It was a splendid offering viewed from any standpoint. In the first place everything offered was either sired by a grand champion or bred to a grand champion—and the pedigrees didn't stop with the sire and dam—but contained the blood of many of the most noted boars and sows of the breed. Indeed, we doubt if any sale held this year contained as much champion blood. In the second place, the whole offering was good individually, and had exceptional size. Several spring gilts were sold that would weigh near 400 pounds.

The top of the sale was Miss Crimson Col. I Am, by B. & C's Col II, out of Belle of Crimson by Crimson Wonder Again. This young sow is easily one of the most valuable sows that has been sold this year and she was knocked off to W. H. & Geo. E. Thomson, of Columbia, Mo., for $270. A White Jr. of Palmyra, was the contending bidder on this sow as he was on all the choicer lots. Mr. White secured Lady Olean, a daughter of Miss Crimson Col I Am, for $140. A spring gilt by Professor's Col. and bred to Col. Wonder topped the gilt di-

15 Registered Shorthorn Bulls--FOR SALE
From 8 to 18 months of age. They are red, white and roans, Scotch and Scotch topped. Sired by the State Fair winner, Sultan's Heir 368468. Taylor's Chesters

W. B. Taylor & Sons, Weatherby, Mo., still have a number of exceptionally good fall boars on hand that they are anxious to dispose of before their spring crop arrives and accordingly they have put the price down to a point where any one thinking of buying can hardly afford to overlook their offer. The Taylor herd has been gotten together by select purchases from the leading herds of the Corn Belt and the produce from the herd never fails to please. Better write at once.

Freeman & Russ' Big Polands.

The Superior herd of big type Polands owned by Freeman & Russ, Kearney, Mo., represents one of the good collections of Polands owned in North Missouri. Just at present they are in a position to furnish most anything one wants from fall pigs to mature sows bred to farrow in April. Most of the fall pigs are sired by the good young boar, King Jumbo, and a number of the sows are bred to him. This young boar was one of the most promising boars the writer saw last fall. He was sired by J. B. D. by Miller's Jumbo, who was by Expansion. His dam was Big Lill by John's Boy by Long John. King Jumbo has everything one likes to see in a herd boar, namely, size, bone and quality. Please mention this paper when you write.

Sheley & Clatterbuck's Sale

The sale of Duroc bred gilts held by Sheley & Clatterbuck at New Bloomfield, Mo., Wednesday, February 24, did not come up to the expectations of the sellers, and proved to be a bargain day for the few who came to buy. This was the second sale held by Messrs. Sheley & Clatterbuck this spring and that fact together with the extreme scarcity of feed in their section mitigated against a better average.

The sale offering was a very desirable one from the standpoint of bloodlines and some very excellent individuals were offered, but for the most part the gilts were bred to farrow later than the average buyer likes.

Several breeders from a distance were present and were active bidders on the more desirable lots.

Longview Farm, Lee's Summitt, Mo., secured some eight or ten head and in the lot was the good fall yearling, Coronation. This prize winning daughter of S. & C's Valley Chief topped the sale at $91. Beauty's Perfection, a fall yearling by Beauty's Model Top and out of the old champion sow, Gatton's Perfection, went to R. W. King, Hopkins, Mo., for $59.

P. M. Gross, of Macon, Mo., conducted the sale and never did an auctioneer work harder to get a crowd to appreciate good stock. During the sale Col. Gross took time to analyze the present conditio nof the hog market and ended by predicting that hogs would jump two dollars a hundred just as soon as the federal quarantine is lifted.

Hill Sells Durocs

In a recent letter from R. L. Hill, who advertises Durocs in this paper, he has the following to say:

You will be interested to know that we have sold them all, selling them all in one day. Ten of them went to Thos. Clark of McBaine, Mo., four of them to Keith Bros of Sturgeon, Mo., two to S. W. McReynolds, Carthage, Mo., and two to H. S. Bryan of Redding, Ia.

Now I am offering boars for sale and will give you detailed description of them. Four of these are Sept., 1914 boars, weighing about 150 pounds, all good color, with plenty of bone, stretch and good type and conformation. I will guarantee these to please the purchaser. These four are all by Col. Wonder II., second prize boar at the Missouri State Fair 1913, a litter mate to Belle of Missouri 3d, grand champion at the same fair in 1914.

Also have some fall gilts of Sept. farrow, same breeding as the first mentioned boars."

We take pleasure in urging those of our readers who are in the market for a boar to write Mr. Hill. You will like the kind he sends out.

The Ennis Farm Poland and Jersey Offering

The advertisement of the Ennis Farm is again changed this issue. They are now booking orders for Spotted Poland China spring pigs to be shipped in June. The demand for early farrowed spotted pigs is always heavy and those who place their orders early are insured of getting the choicer lots. Mr. Ennis advises us that he has about twenty-five sows bred for spring farrow. These sows are bred to one or another of the five boars doing service in this herd and pairs, trios or more of unrelated pigs can be furnished. Mr. Ennis also owns the Sunset herd of Jersey cattle, consisting of about 115 head, all of which with the exception of five or six have been bred on the farm. From time to time the farm offers young bulls and heifers for sale at very reasonable prices. Those of our readers who are interested are urged to write for further particulars.

Turpin's Angus Offering

Elsewhere in this paper will be found the advertisement of Robt. D. Turpin, Carrollton, Mo., in which he offers one aged bull, eight coming yearling bulls and several yearling heifers. Mr. Turpin has been in the Angus business a number of years and his herd is producing the kind that pleases the careful buyer. You will find his prices extremely reasonable.

Obadiah Prettyman, Fairfax, Mo., is now offering two good big type Poland China yearling sows bred for May farrow —also one fall yearling sow bred for June farrow. Besides the above stock he has an exceptionally good lot of spring gilts bred for May farrow. These spring gilts are dandies and will weigh in good breeding condition a little over 300 pounds. Mr. Prettyman has an excellent herd and we are glad to call our readers' attention to his ad and to recommend his stock.

Stockwell's Champion. Grand Champion Jersey Bull at Misssouri State Fair, 1914. Owned by J. B. Smith.

F. L. Crosby, of Mexico, Mo., is offering a number of choice young Clydesdale stallions and mares sired by Gallant Sturdy. Gallant Sturdy has been a winner wherever show and for the past two years has been made champion Clydesdale stallion at the Missouri State Fair. His get have also been winners at the same show and several of the young things now offered are prize winners.

The war is taking thousands and thousands of horses out of this country and while it is true that they are buying the lighter and cheaper sorts, it means that there will be a marked shortage in this country and when times take a turn there is going to be a tremendous demand for the good kind. The time to get into any business is when the prices are low and we feel sure that Mr. Crosby can make a mighty interesting proposition to those of our readers who may be interested.

Smith's Jersey Offering

J. B. Smith, Platte City, Mo., is offering about thirty head of choice Jersey cows at very reasonable prices. Many of those offered are bred to Stockwell's Champion, grand champion bull at the Missouri State Fair last year. Mr. Smith has been one of the leading exhibitors for the past few years and his winnings in the show ring are evidence of the quality of this herd.

In addition to the cows and heifers offered Mr. Smith has four young bulls for sale.

Gebhardt Bros., of Palmyra, Mo., are offering several very choice Guernsey bulls for sale. These bulls are right in every respect and our readers will do well to write Messrs. Gebhardt.

IS YOUR HORSE WORTH $1.00?

YOUR MONEY BACK IF IT FAILS

You wouldn't keep a horse or any other animal very long if he wasn't worth a dollar, would you? If an animal is worth keeping at all he is worth keeping in good health. It costs only a dollar to keep a bottle of the old reliable

(7) CRAFTS' DISTEMPER REMEDY

in your barn and protect your animals from disease. For 22 years CRAFTS' has been sold on an absolutely guarantee to cure Distemper, Coughs, Colds, Influenza, Epizootic, Catarrhal Fever, Pink Eye and all similar diseases of the head and throat in horses, sheep and dogs, or your money refunded. CRAFTS' cures quickly, destroys the germs, tones the blood, and restores the victim to perfect health. Buy a bottle today, you take no risk, satisfaction guaranteed. If your druggist does not have CRAFTS', we will send it prepaid on receipt of price. Be sure to get the genuine. Imitations are never so good. 50c for trial size. $1.00 size three times as large. MONEY BACK IF IT FAILS.

Valuable Horse Book Free chock full of "horse sense"—tells how to treat and cure all the common ailments of horses. Send for your copy today—a postal brings it FREE by return mail.

Wells Medicine Co., 33 Second Street Lafayette, Indiana

RAUSCHER'S CHESTER WHITES!

One of the Oldest Herds in the West

A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.

H. Rauscher & Son, Kahoka, Mo.

Glenvarloch Large Yorkshires

The prolific, growthy and gentle bacon hog. Closing out entire herd at private sale. Bred sows, boars and pigs either sex. The produce of one Yorkshire sow will keep your family in delicious meat all next winter. Everything at bargain prices. All immune.

Frank Gildow, Mgr., Jamesport, Mo.

POLAND CHINA BRED SOWS

DOUBLE IMMUNE

Two good yearling sows for May farrow. Have raised two litters. One fall yearling for first of June. Had one litter. Spring gilts for May farrow, weight about 300 lbs. These are the big broad-backed kind and prolific.

Obadiah Prettyman, Fairfax, Mo

DUROC BOARS

Extra good fall boars. Plenty of size and bone. Prices right.

C. D. CALDWELL, Milan, Mo.

Guernseys are Champions

of the world over all breeds in butter fat production. If you are looking for something extra in a registered Guernsey bull, write us.

WE CAN SUIT YOU

GEBHARDT BROS., - Palmyra, Mo.

JERSEY CATTLE

Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.

Wm. H. Bruns & Son, Concordia, Mo.

Jerseys-Spotted Polands

April Special—Jerseys: I will offer for April only, six young bulls, ready for service, at lower prices than I have quoted for six years. Also bred heifers.

April Special—Spotted Polands: For April only I am offering 35 fall boars, mostly October farrow, at $20 each. Order now. Also sow pigs and bred gilts for sale. Free circular.

THE ENNIS FARM, HORINE STATION, Mo. (Just south of Saint Louis)

Jersey Cows

I want to sell 20 head of registered cows and heifers that are either fresh or soon will be. Also four young bulls.

J. B. SMITH Platte City, Mo.

HOLSTEINS

Young bulls and heifers from A. R. O. cows. Sired by Sir Korndyke Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.

M. E. Moore & Co., Cameron, Mo.

ELM LAWN HERD IMPROVED CHESTER WHITE SWINE Choice boars and gilts of September and October farrow for sale at reasonable prices. Everything recorded free.

W.B.Taylor and Sons, Weatherby, Mo.

Economy Calves

You can now feed a calf for the first five months of his life for less than half the cost of the milk he would consume in the old way. Do this with

Blatchford's Calf Meal

This meal has been known as the complete milk substitute since the year 1800. Very easily prepared. It prevents scouring promotes a strong rapid growth and makes a better cow.

Write for Actual Figures based on results, that show you how to increase your calf profits. The new data will be sent for the asking. Write today.

Blatchford Calf Meal Factory, Dept. 4214, Waukegan, Ill.

A Broken Implement Part—and Town Twelve Miles Away!

BUT distance doesn't bother the modern farmer. When a machine breaks down, he hands the broken part to one of the boys and sends him to town—knowing he'll be back promptly. For 25 miles an hour is easily covered by the 1915

Indian Motocycle

Used to take a good horse a whole day to do the same job—but you had to take him away from the farm work and that delay meant money.

The Indian climbs the long hill as quickly as it skims over the level road. Heavy, rutty roads are made smooth roads by the *Cradle Spring Frame* which absorbs all vibrations and gives the utmost ease and riding comfort.

The 1915 Indian is the finest, fastest, most economical, most powerful, most serviceable machine ever built. It has 9 Big Basic Innovations—every one a mighty important necessity—and 20 refinements that loom up as the biggest values ever put into a motorcycle.

And that great *international* reputation behind the Indian—it means everything to the farmer who buys wisely. It keeps him from wasting hard-earned money on a machine that hasn't a reputation to make it make good.

A chain of Indian factory branches, large distributors and 2,800 dealers assure over-night service for Indian riders—*anywhere.*

Your beautifully illustrated 1915 Indian Catalog is ready. Where shall we send it?

HENDEE MANUFACTURING CO., 787 State St., Springfield, Mass.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Get Him Interested

Some years ago, substantially this conversation took place between a stalwart Missouri farmer and his fifteen year old son: Said the Father to the boy: "Neighbor Jones tells me you have rented a couple of acres of ground from him. If you wanted some ground, why didn't you ask me for it? We've got 320 acres of as good farm land as there is in the township." "Well," replied the sturdy little fellow after some hesitation, "I know we've got plenty of good land but if I asked you for any I am afraid you wouldn't let me keep all I raised on it. Neighbor Jones promised to let me pay him one-third of the crop for rent, so if I don't raise anything I wont lose anything except my work—and I thought I'd have enough time to work those two acres when things are not rushing here at home."

Thus matters rested for the time being. The grizzled, hard fisted old farmer was not particularly pleased but offered no further open opposition. The boy, on the other hand, carried out his bargain with the neighbor. He planted his two acres of rich, loamy bottom land in potatoes—hoed them carefully at odd times and raised enough so that when they were all sold he had $40 left for his toil—and he was happy. "Now, what are you going to do with your money?" asked his father one evening at the supper table. After gulping down several half masticated mouthfuls the little fellow answered eagerly, "I want to buy me a nice new saddle with part of it—and then I thought I'd like to buy several of your shoats with the rest if you will let me." "Well," said the old farmer, that proposition about the shoats is sensible—but what do you want to waste a lot of money on a new saddle for? Isn't our old saddle plenty good enough for you?" The boy was too crushed and hurt to reply and, after a moment, with his eyes full of tears and a sob he left the supper table. It was at this stage of the little drama that his mother interfered—mother, who is the "Good Angel" of every boy—and after mildly chiding her husband for his unsympathetic harshness, the old farmer called to his son out in the kitchen and said, "Never mind, boy, you can have that new saddle and I'll let you pick out five of the best gilts in the feed lot."

We recite this tragedy of a little farmer boy's longings and ambitions because we know that it finds its counterpart in hundreds of Missouri farm homes today and because we hope the lesson may strike home to every man who reads it—that it may inspire within his breast a little more heartfelt sympathy and interest in the little fellows who are growing into manhood under his care and guidance and from whom the community, state and Nation expects so much in the future. This farmer was a splendid citizen so far as thrift, sobriety, etc., are concerned, and in the ordinary sense a good father—and yet, because of a lack of broad human sympathy such men often literally trample upon the hearts of their loved ones. He saw the "dollar" side of his boy's hog raising proposal but could not see that a nice new saddle was the "leaven"—the inspiration from which his interest and success in the other things would largely come.

One reason why so many farmer boys drift to the cities is because they were not taught to take a genuine interest in the brighter side of farm life while they were still young and impressionable—because it is too much of a grind from one year's end to another—because there is never an hour for play and amusement and because they are not given a vital, personal interest in the things they do. Boys are miniature men and though we may not realize it, they possess the power of reasoning just as we grown ups do—and every day finds this reasoning process more fixed and settled. First, see that your farm home is made " a good place to live in"—and by this I do not mean that it must be costly in its appointments, etc. See to it that the boy's room has an inspiring picture or two in it—that it looks inviting and cozy, and lastly, give him a pig or two or a few sheep—or an acre or two of land—something of his own. Require him to look after these things personally—and give him every penny he can make out of them. Finally, don't forget that occasional kindly pat on the head and a friendly word of encouragement and praise once in a while. Give him cause to love the farm rather than hate it.

CONCRETE SILOS IN CAPE GIRARDEAU COUNTY

It will probably interest your readers to read an account of concrete silo building in this county. The growth of the dairy industry, the favorable outlook of the beef cattle business and a short corn crop all combined to turn people toward the silo as a means of preserving and making the fullest use of the feed produced.

About 100 silos were constructed in this county the past year. The majority were stave, quite a few were pit silos, one or two of the Gurler type, and seven monolithic concrete silos. All of them are giving good satisfaction and if there is a dissatisfied silo owner in the county I have not heard of him. It is a well known fact that all that is necessary in keeping silage is to have the silo airtight, of such a shape that the silage will pack readily, and to put the corn in at the proper stage, well packed. This article, however, is not intended to be a general discourse on all silos, but rather on the construction and cost of seven concrete silos.

In the first instance four farmers cooperated: forms were built of native lumber according to blueprints furnished by the State Agricultural College. A man thoroughly experienced with the work was also sent to help get things started. The inner forms were covered with tin in order to obtain a smoother inside wall. The first silo completed was 10 by 20; it was constructed at an actual cash outlay of $57.50. This sum represents 100 sacks of cement at 40c per sack, hired labor $12, wire re-enforcing and miscellaneous $5.50. Gravel of good quality was near at hand and the owner hauled it himself. The three neighbors who were also going to build helped with the work and were helped in return.

The next one put up was 10 by 24 feet. In this case there was an actual cash outlay of $65. The next two were each 10 by 28 and in each case $75 was expended. These four silos were the ones where the four men helped each other and conditions were practically the same in each instance. The last three were somewhat smoother than the first one but the silage has kept equally well in all of them.

The next silo is 10 by 36 feet and in this case a complete record of all cost was kept and every legitimate charge that could be made was put down. The forms are of high grade pine flooring and were constructed by an expert carpenter who used blueprints from the College. Both inner and outer forms were covered with metal. The cost of forms was $40. Gravel was hauled four miles and $1 per yard paid for the hauling; a special grade of woven wire re-enforcing was used and all labor was hired and paid current wages, even the board of the workmen and extra visitors was taken into account. The total cost of the silo exclusive of forms was $180. It was not thought proper to include the cost of the forms because rental from them will more than pay first cost.

The next silo is 10 by 34 feet; it was built with the above mentioned forms and $15 paid as rent for their use. Three men were hired regularly, but all hauling and the work of the owner and his two sons was not charged for. This silo complete required a cash outlay of $142.

The seventh and last silo is 12 by 32½ feet. Chats were shipped from the mines at Fredericktown to Allenville in this case because gravel was not close enough to profitably haul it. The carload of chats cost $23 at the station, of this amount $20 was freight. The haul of two and one-half miles to the farm was charged against the silo. The cost of forms and the labor of the owner and his two sons was not taken into account, although all hired labor and materials were. The silo on this basis cost $166.50.

These figures are somewhat lower than the owners themselves counted on before beginning the work. Every one of them is giving full satisfaction and the silage is first class. Without any doubt whatever there will be a considerable number of them put up this coming season; each silo is a convincing demonstration of what can be accomplished by careful construction with good material.

Summarizing, we have:

10 by 20 concrete silo with a cash outlay of $57.50.
10 by 24 concrete silo with a cash outlay of $65.
10 by 28 concrete silo with a cash outlay of $75.
10 by 28 concrete silo with a cash outlay of $75.
10 by 34 concrete silo with a cash outlay of $142.
12 by 32½ concrete silo with a cash outlay of $166.50.
10 by 36 concrete silo, cost complete, everything accounted for, $180.

We believe these figures worthy of careful consideration.

C. M. McWilliams,
Farm Adviser Cape Girardeau.

SHOULD USE PURE BRED BOARS

Missouri ranks third in the number of hogs produced for market in the United States, but much lower than that in value per head. One can readily see from these facts that there is something the matter with the quality of hogs produced in Missouri. When one goes on the markets and watches the car loads from different states, they will notice the great difference in quality of the hogs shipped from different sections. Some sections produce hogs with more quality and of course their hogs command a higher price on the market. One who is familiar with conditions in Missouri and other states knows that conditions are just as good or better in Missouri than in any other state for producing hogs. Our grain and forage crops are produced just as economically. It is not any of these factors that we need to bring about improvement in our hogs, so much as that of using more pure bred sires. It is a recognized fact that the herd boar is fifty per cent of our herd. Therefore every farmer who wants to get more money for his hogs, and bring the value of Missouri hogs up should use a pure bred sire. Purchasing a pure bred sire is not an extra expense, but an investment that will pay big. Grades are sometimes just as good individuals as the pure bred boar, but they have not that ability to transmit those good qualities of their former parents. It is probable that the grade boar's sire or grandsire was a poor individual, and would have as good a chance to transmit to his offspring those poor qualities as the pure bred boar would have to transmit his good qualities, which have come down from good individuals for generations back. So brother farmers, if we will all use more and better pure bred boars, we will get somewhere toward improving Missouri hogs.

Roy Baker, Bates County.
Student in Short Course.

DEFECTS OF THE TWENTIETH CENTURY FARMER

The greatest defect of the farmer today is his limited education. As the country is becoming more populous and competition is becoming keener, the farmer must have more education.

The average farmer seldom knows what kind of fertilizer his land needs. He does not give manure its proper value and does not take care of it in the best way. He does not think that crop rotation is as important as it is, and, of course, does not practice it as much as he should. As more machinery is being introduced on the farm all of the time, he is not as much of a mechanic as he should be.

As a general rule, he does not conduct his work in a business-like, systematic way or plan ahead much, but just works at one thing until he gets tired and then begins on another. He does not keep records enough, and seldom knows whether or not his stock is paying for its board.

A very small per cent of the farmers have scales, and, when selling grain to one another, usually have to guess at the weight or haul it two or three miles out of the way in order to weigh it. They generally think only of the cost of such conveniences and forget about the valuable time it would save them.

Another valuable investment that the farmer generally fails to make is painting. Painting not only increases the selling price of the land above the cost of paint, but also increases the beauty of the place.

Roy Cox,
Moundville, Mo.

[The above theme was written by Roy Cox in answer to the question, "What are some of the most common defects of the farmer today?" It was written in class work in the Moundville, Public Schools, where agriculture is taught successfully by C. A. Smith. The Missouri Farmer is used in the class work in the Moundville school.]

Bears Close Inspection.

The Missouri Farmer came into our family about a year ago and lay on the library table unnoticed for quite a while for we were taking higher priced papers published outside the state.

One day I picked it up more through curiosity than anything else and found it discussing some of the very problems I had been turning over and over in my own mind and in every number I find things that seem to have been put there just for my especial benefit. Now the other papers lie on the table until The Missouri Farmer is read.

I enclose check for one dollar and do not cut me off without fair warning when my time is out as I do not want to miss a number.

J. W. Payne,
Howard County.

[We have many times called attention to our policy of standing on merit and the actual concrete help we can be to our readers. We have received a great many letters recently along the line of the above and of course we are pleased with the sentiment. We believe a paper edited and published by men who are and have been for years identified with Missouri, a paper whose capital is all invested in Missouri and whose profit is—every dollar—spent in the state, ought to have the support of every progressive farmer living within her borders. We are willing to send the paper to any farmer on the basis that if it does not help him more than a dollar's worth we will refund his money.]

Farmer Girls, Attention!

Would you like to earn a beautiful diamond ring, a lavalliere or a handsome wrist band watch? If so, we shall be glad to tell you how you can do it during your spare time. Write us at once for full particulars. Address, William Hirth, Columbia, Mo.

The Missouri Farmer

VOLUME VII APRIL 15, 1915 NUMBER 8

The Profitable Use of Fertilizers for Corn

By C. B. Hutchison, Professor Farm Crops, University of Missouri

The use of commercial fertilizers is becoming more and more common in Missouri each year. This is due to the fact that the lands are gradually being depleted of their fertility by exhaustive systems of grain farming and also to the fact that lands are constantly increasing in price. When the productiveness of land becomes sufficiently low that remunerative crops cannot be secured, the use of fertilizers is ordinarily one of the first things that is adopted to bring better returns. The increasing use of fertilizers, therefore, is an index to decreasing soil fertility and to increasing land values.

In general it may be said that plant food in soils exists in two forms, first, the insoluble or unavailable form, which constitutes by far the greatest part of the total amount present; and second, the soluble or available plant food, which may be absorbed by the plant roots. The latter is found in only small quantities and it is the form upon which crop yields depend. It is the business of the farmer so to manage his soil that there may be a sufficient quantity of plant food available at all times to promote maximum growth and thus permit of maximum yields. The presence of a good amount of organic matter or humus in the soil is a very important factor in keeping the proper amount of plant food available, since the action of its decay in the soil causes the insoluble plant food slowly to dissolve. With excessive grain cropping the organic matter is exhausted and the immediately available plant food depleted. The soil is thus left in such a condition that plant food is made available too slowly for the needs of the plants and crop yields are accordingly decreased. It is at this time, therefore, that the use of commercial fertilizers is usually resorted to for the purpose of supplying soluble plant food.

Commercial fertilizers are simply concentrated forms of one or more of the three plant foods that are commonly lacking in all soils, namely, nitrogen, phosphorus, and potassium. On worn lands the available supply of all three becomes low as explained, although the soil may be fairly well supplied with some of them in an insoluble form. Complete fertilizers contain all three of these plant foods and are most commonly used on these worn lands both with corn and wheat. Such fertilizers are sold on the market under the name of "Grain Growers," "Corn Growers," "Truck Growers."

The Missouri Experiment Station for a number of years has been investigating the fertilizer needs of Missouri soils. These experiments have had to do with the use of various fertilizers, manures and lime with crops in rotations and with direct applications of fertilizers for corn and wheat. The results of these investigationns warrant some definite recommendations regarding the use of fertilizers with corn.

On fields conducted at Carthage and High Hill, fertilizers have been applied in the hill with corn. The results of these treatments are given in the following tables:

FERTILIZERS IN THE HILL FOR CORN—HIGH HILL EXPERIMENT FIELD (1)

Kind of Fertilizer	Cost of treatment per acre	Yield of corn in bushels per acre 1909	1910	1912	Av. 3 yrs. '09-'10-'12	Av. 3 yrs. '10-'12
None		36.4	45.0	26.3	35.9	35.7
Bone meal, 50-lbs.	$ .70	36.9	56.0	31.8	41.6	43.9
Bone meal, 75 lbs.	1.05	39.7	59.0	26.9	41.8	43.0
Bone meal, 100 lbs.	1.40	37.1	57.0	25.1	39.7	41.0

2-8-2, 50 lbs.	.60	*34.7	46.0	34.7	38.5	40.3
2-8-2, 75 lbs.	.90	*36.7	49.5	27.7	38.0	38.6
2-8-2, 100 lbs.	1.20	*38.3	50.5	28.7	39.2	39.6
None		*34.2	40.5	24.8	33.2	32.7
3-8-6, 50 lbs.	.80		50.0	31.0		40.5
3-8-6, 75 lbs.	1.20		47.0	30.2		38.6
3-8-6, 100 lbs.	1.60		50.0	32.9		41.4
None			39.5	26.6		33.0

* Average of two plots (1) Bulletin 126 Mo. Agr. Exp. Sta.

These small applications of fertilizers in the hill have given profitable returns on the High Hill field. As an average for three years, fifty pounds of steamed bonemeal to the acre have increased the yield of corn 6.3 bushels. Seventy-five pounds have given an increase of 6.6, and one hundred pounds an increase of 4.4 bushels to the acre. The smaller yields from the heavier rates are due to the fact that some times large amounts of fertilizers in the hill are apt to cause the corn to fire badly in seasons of drought. Just why this should be is not very well understood. It is probable that too large an application is not quickly used up, and, hence, tends to keep the feeding roots confined to a small area throughout the season. With the small application on the other hand, the fertilizer is quickly used up and the roots spread through the soil, making it less likely that the drought of late summer will injure the plant.

Complete fertilizers of a composition of 2-8-2 have not given as profitable returns during the same period of time on this land. It should be noted that these experiments were located on soil on which a great deal of manure has been used and cowpeas grown so that the soil is well supplied with organic matter, and consequently not so badly in need of nitrogen as of phosphorus. The heavier application of phosphorus in the bone meal has given better returns than the lighter application in the 2-8-2 fertilizer. It will be seen that the increase from the 2-8-2 fertilizer has been 4.6 bushels, 4.1 bushels, and 6.3 bushels with fifty, seventy-five and one hundred pounds per acre respectively. Again, the lighter application has been most profitable. The increases for the two year average vary somewhat from those of the three year average, but in general demonstrate the same truths.

Similar experiments with fertilizers in the hill for corn were tried at Carthage. The following table is a summary of three years' results. There were some variations in the amounts of fertilizers applied, but in each year heavy and light applications were compared.

FERTILIZER IN THE HILL FOR CORN—CARTHAGE EXPERIMENT FIELD (1)

Kind of Fertilizer	Amt. of application	Yield Bu. per acre	Increase over no treatment bu. per acre	Value of increase	Cost of fertilizer per acre	Net return per acre
2-20 bonemeal	Light	39.0	6.0	$3.30	$1.40	$1.90
2-20 bonemeal	Heavy	41.7	8.7	4.79	2.10	2.69
2-8-2	Light	42.6	9.6	5.28	.80	4.48
2-8-2	Heavy	43.7	10.7	5.89	1.30	4.59
2½-6-2	Light	39.6	7.4	4.06	.75	3.31
2½-6-2	Heavy	40.0	7.8	4.29	1.20	3.09
None		33.0				

(1) Bulletin 119 Mo. Agr. Exp. Sta.

The results of the experiments at Carthage likewise show that fertilizers may be applied with profit in the hill or drill with corn. In this case, however, the heavier applications have generally been best, and the mixed fertilizers better than bonemeal. Fertilizers are best applied by means of a fertilizer attachment for the planter, which drops the fertilizer near the hill. Best results may be expected, as a rule, on medium to poor lands with 60 to 75 pounds of a complete fertilizer containing 2 to 3 per cent nitrogen, 8 to 12 per cent available phosphoric acid, and 2 to 4 per cent potash. Steamed bonemeal applied at the same rate, especially on land where the nitrogen and humus have been maintained by manure and green manure crops, will give practically the same and in some cases even better returns.

The practice of using fertilizers in the hill with corn should always be combined with careful soil building practices, however, and not be depended upon simply to grow another crop on an exhausted soil. It should be clearly understood that such small applications do not contain enough plant food to make a crop of corn. They simply give it a quick, vigorous start which probably enables the plants better to withstand the attacks of insect enemies and fungous diseases as well as to keep ahead of the weeds.

Another method of using fertilizers on corn is to distribute it with a fertilizer grain drill ahead of the planter. Where applied in this manner, 150 to 200 pounds of a complete fertilizer on the poorer lands will usually give good results, while steamed bonemeal or acid phosphate will be more remunerative on the better lands, since on such lands phosphorus is usually the limiting element.

It should be understood that such a use of fertilizers, except in connection with other soil building practices, is only a temporary expedient for the man who must have immediate re-

FERTILIZERS WITH CORN

Plot on right received Nitrogen, Phosphorus and Lime treatment and yielded 44.3 bushels of corn to the acre. Plot on left received no soil treatment—yield 34.6 bushels to the acre.

turns. Their use alone will not permanently maintain the fertility of the soil. In fact, their continued use alone for the purpose of growing an immediate crop on an exhausted soil ultimately will injure the soil. The gross returns from the corn crop are not great enough to justify the expense of heavy applications of fertilizers. Profitable returns on this crop must depend chiefly upon the use of plant food from the store within the soil. This supply may be kept at its highest state of efficiency through the proper management of the cropping system, the use of barnyard manure, and green manure crops supplemented by the judicious use of fertilizers. The proper use of fertilizers, then, for the man who owns his land is as a supplement to the best system of crop rotation and manuring that a man can practice in order that the humus content of the soil may be maintained and favorable conditions supplied for making soluble the plant food that exists in the soil.

"THE CRIMSON TRAIL OF A NEW IDEA"

CHAPTER II

Just one more howl has been heard about the move for "Cheaper Money for the Farmer." Here it is: "The methods of the farmer on an average are not so good as they ought to be, and too many farmers actually refuse to make use of the means they have at hand to make any improvement." "He believes he knows all about the farm game, and a man in that attitude is not able to learn much." Comment may not be necessary, but once in awhile word comes from some one that "I don't need any advice about farming. I have farmed all my life, and nobody can show me how to farm," etc., etc.

Usually the person who thinks he cannot be shown anything more about farming, can most always prove his point. Go past his farm and take a look and anyone can get all needed evidence that the fellow is right. I have known many who could not be taught much. One man in Nodaway County said he attended a farmers' short-course for two weeks and did not learn a thing. We often find men like this one and they should not be blamed; they should be pitied, since they cannot help their condition. They are usually harmless and to confine them seems hardly necessary.

If "cheaper money would be a detriment to farmers" as has been argued it would be just as logical to say that dearer money would be the farmers' salvation.

While we are on the subject of funny arguments, I heard a story once about myself. By the time it got back to me the fellow had it that "Jordan said if there were no renters people would not have to lock their smoke houses." If I had said such a thing I would have had to class myself among them for much of my life has been spent on and in rented property, but the person, no doubt, meant to do no harm, but really he must have been harming no one but himself, since the story could not be reasonably believed that a man with just a little gumption would make such a public statement, consequently, the only effect that could logically follow would be to give the teller of such foolish yarns a reputation for most anything except to tell the truth. The same man had no doubt heard me say at least one good thing that might help some one, and don't you think he would have felt better had he repeated the good?

Sam Jones once said "Throw at a bunch of dogs, and the guilty ones will howl, tuck their tails and run." Did you ever know of a person try to create a favorable impression about himself by condemning some one else or by offering in a loud voice a "fervent" prayer? Perhaps distorted statements, and falsehoods with no possible foundation may be what David Harum was troubled with, and from which he got the following consolation, "It is good for a dog to have a few fleas." You see it keeps the dog from getting too lazy. Matters of this sort, I sometimes think, give a man his fighting strength, and makes blood good and red while the "Mrs. Grundy" fellow soon shows up his yellow streak.

Not far from 90 years ago a young man conceived a new idea. His attention to his experiments took all his time and means, until his family was reduced to poverty and want. All the people said "It can't be done." But Charley yet thought it could. He was thought by many to be insane and he was dubbed "The India Rubber Fool," but ignoring his traducers he kept on and finally succeeded and gave to the world the rubber fabric that is now put to hundreds of uses, and that requires thousands to manufacture it to meet the demands. He had many lawsuits to protect himself for as is always the case many were trying to steal his ideas as well as his reputation and name. Where rubber goods are known Charles Goodyear is known, and he is today counted as one of the world's benefactors, but he had to travel the crimson trail.

My father made the first double shovel plow made in Gentry County, Missouri, where he farmed and worked at odd times at his carpenter trade. He used to make the coffins for the burial of people in that community, and I have held the candle many a night while he worked, and he would many times "call me to order," when I would become so sleepy I would almost drop the candle. He would say, "Hold the light so I can see." Many folks would not think of buying anybody's "store" coffin in those days. It must be made of solid walnut, no veneered goods for them, so each coffin had to be made as needed according to measure, and for years sticks showing length and width of the dead person stood in the corner of the shop. The ready-made coffin had hard sledding, and don't you remember how "that two-shovel plow will never do the work?" "Single shovel for mine." Once in awhile he could talk a man into buying one of his double shovel plows.

I have often wondered why he did not see the idea of attaching two of his double shovels to a truck, making the modern cultivator, but then it would perhaps not have done him much good. It would have been simply too much for us to make such a dangerous leap all "so sudden" from a single shovel to a cultivator, and just think what the results would have been had it been made a "riding cultivator?" That would have been too much, the mob would have taken him.

Later he did make riding cultivators for our own use. He made a two row, wheel corn planter, and we rode on that. He also bought the first sulky breaking plow in our neighborhood. The folks all called him lazy, and said he would kill his horses, etc., but he did not kill them. There was no kinder man to his family, and a man who is good to his family is usually good to his horses, too. It seems that I can almost hear him now as he laughed at the remarks made about him over such things. He never lost his temper but always had a kindly remark for the person who might, behind his back, try to do him harm. He was a great reader, well posted on the topics of the day and most folks knew him too well not to tackle him in an argument on most any topic. Oh, yes, he was "for" the church organ too. How were you on that organ business, uncle?

May be those church organs and fine country girls gave me my love for "chin music," and maybe those riding farm machines were the cause of my great laziness. But gee, that organ business did have a tough time getting located. It should be clear that the Lord never intended us to praise him by machinery, and then along came that other new fangled idea, the baptistry. The very idea of a tub right in the church house, too, to baptize folks in. "None of that for me." The Lord intended that all true believers should be baptized in the creek any way and it was cheaper. Then comes along some Alec and suggests that the water in the tank be warmed. That was the last straw, for "I've allus seen it, that if the ice is cut in the creek and that the water is deep and cold, that a feller's religion jest sticks to him a little tighter."

The self-binder made many a bonfire before it established itself, it took thousands of years to transform the reap-hook to the reaper—but this chapter is too long now.

It should just be recalled that modern farm machinery, the church organ, the baptistry, the "store made coffin," all had to fight their way over "The Crimson Trail of a New Idea."

Sam Jordan.

FARMERS SHOULD CO-OPERATE

I have been thinking for sometime I would write you my endorsement of the articles on co-operation among the farmers which have recently appeared in The Missouri Farmer, and especially the articles by Mr. Ellis.

It has always been strange to me that farmers could not get together and co-operate and this season has been one of more than ordinary opportunity for such a move.

Farmers have been compelled to transfer feed from one section of the country to another and a large portion of it has been done through middlemen, but if proper co-operation had existed between the farmers of the different sections of the country, it would have resulted in quite a saving.

It seems to me that if some plan could be inaugurated between the parties, so that an equitable division of middlemen's-profit would be had, it would result in quite a saving to both parties.

A business man of Columbia not long since said to me, "Look what you farmers are getting for your wheat?" But I had only to remind him of the fact that the farmers of Boone County, or a large majority at least, had marketed their wheat crop at 68 to 70 cents per bushel and that the speculators were receiving the difference between that and the present price.

It seems to me that if co-operative creameries, fruit companies and other business, can succeed through co-operation, that the farmers in Missouri could succeed through co-operation in the management of elevators to market wheat and other grain, and to buy feed, and through lamb clubs (which have already been tried to some extent) and clubs for control of hog cholera, and other live stock associations for the protection of the small shippers as well as the large.

About 25 years ago there existed in this county as well as throughout the state a farmers organization known as the Wheel and then a little later as the Alliance, both secret societies organized for the purpose of bettering the farmers financially, morally and educationally but designing politicians brought about the disruption of the organization. At no time did it get farther than the organizing of a few local stores and the establishing of a mail-order house. At one time, however, it almost succeeded in establishing an elevator and mill in this county but failed because no agreement could be made as to where the plant should be located. Such mills were established in other states about that time but it seems that the farmers of Missouri were then and are now afraid to trust each other with any enterprise of that kind. There seems to be no reason why a man with one or more hogs, cattle sheep, or anything else in that line, should not be able to take the same to the local market and receive the market price for it, without having previously sold the same to some dealer. Such might be done by establishing a local market day or days, as the case might be, for each week, and parties having stock to sell delivering on those days. If farmers only realized it they hold in their power the making of the strongest organization that ever existed, the consumation of which would turn the world up side down, and make all other business sit up and take notice.

U. C. Crane, Boone County.

MANURE AS A FERTILIZER WITH CORN
University of Missouri, Soil Experiment Field, Jasper County.

Plot on left received no soil treatment—yield 29.2 bushels to the acre.
Plot on right received 8 tons of manure to the acre—yield 64.7 bushels.

Girls, Attention!

We want the name and address of every bright, ambitious country girl in whose home The Missouri Farmer is a visitor. We have some mighty good news for you—something which will interest you tremendously. The moment we hear from you we will write and explain fully. Just drop us a line, care The Missouri Farmer, and tell us you are interested. Don't delay until a lot of other girls get ahead of you. Write today. We hope that every subscriber in whose home there is a girl who might be interested in this will call her attention to this notice and urge her to get in touch with us at once. We promise you in advance that she will be keenly interested.

CHEAPER FARM LOANS

A great deal of business is done these days on borrowed capital. Approximately only one-third of the farmers of this state own the land they till free from debt; about one-third own the land heavily encumbered with debt and the rest do not own any land at all. Some of those who own their land use borrowed money for improving the land, building barns or houses, buying machinery and live stock and taking farmers altogether there are few who do not use borrowed capital. The amount of capital necessary to buy, improve or stock a farm is double and in many instances more than double what it was twenty years ago. Not only does it take more money to operate a farm now than ever before but farming is done on a closer margin and it takes better business methods now than it did twenty years ago to get any profit at all out of farming. These facts are recognized not only by the farmers themselves but they are seen by our statesmen, bankers, business and professional men, all of whom generally admit the imperative need for cheaper money for productive farm purposes.

Missouri was one of the very first states to recognize this demand and the recent Legislature enacted a law which when put into effect will provide for the farmers of this state money on long time and at a much lower rate of interest than the current rate. Before this law can be put into operation, however, it will be necessary for the people to approve an amendment to the state constitution which it is proposed will be submitted by initiative to be voted on at the general election to be held in 1916.

The law passed by the Legislature is known as the Gardner Land Bank Bill because the plan was first submitted to the Legislature by Col. F. D. Gardner of St. Louis. The measure was introduced in the Senate by Hon. Anderson Craig of Nodaway County, and in the House by Hon. Noah W. Simpson of Lewis County. In speaking of this law recently Senator Craig said: "If the amendment making this law constitutional is adopted by the people I think it will be the greatest legislative achievement in the history of the state. It will bring in an abundance of foreign capital. It will put the farmer on his feet and enable him to meet all competition. It will start the wheels of commerce in every village and city. It will encourage the small farmer and tend to reduce the tenant system. If this system had been adopted 20 or 25 years ago we would not have seen the rural population decreasing and the cities overcrowded with men out of employment." Representative Simpson says, "Our farmers must have relief from these short-time, exorbitant interest rate farm loans, or the next generation will not only have to face an impoverished soil but a complete deterioration in farm life. It is a lamentable commentary upon our state that while loans, secured by Missouri farm mortgages, are as safe as a bond of our National or State Government, yet, in these times of general business depression we see interest on farm loans being boosted up to 8 per cent all over the state."

When this law becomes effective it ought to be a great encouragement to men who have a ltitle money to make the first payment on a farm to become land owners instead of renters. Then to the man who is now hopelessly laboring to pay the high rate of interest he is compelled to pay under our present system it will give hope that by paying no more than he has been paying he can under the Gardner Bill pay off his loan and own his land free in 20 or 25 years. To put this measure before our readers for discussion we print the following summary containing the essential provisions of the law:

The operation of the law is to be supervised by a board composed of the Governor, Attorney General, Secretary of State, State Treasurer and State Auditor. The members of this board get no pay other than their present salary. The business will be managed by the State Bank Commissioner.

The bank will make loans to farmers on notes secured by deeds of trust on farm lands for not more than one-half the value of the land. The time of the loan is not less than 5 nor more than 25 years and the amount not less than $250 nor more than $10,000 but preference will be given to loans of less than $5,000. Loans shall not be made for speculation or otherwise except for the following purposes: (a) To increase the production of the land mortgaged; (b) To make useful improvements thereon; (c) To pay off liens or encumbrances or to make part payment of purchase price where the borrower is paying part of the purchase money; (d) Twenty-five per cent of the amount loaned may be used for the purchase of stock and machinery.

The board may require the interest and partial payment of the principal to be paid annually or semi-annually and the borrower may pay off the entire loan at any interest paying date. The first $500,000 in loans will be made at 4.3 per cent plus one-half of one per cent to create a reserve fund and 1.7 per cent as partial payment on the principal. Upon this basis the man taking a loan for $1000 would have to make the following annual payments to meet the interest and pay off the debt. If the loan is for 5 years the borrower will pay annually $224; for 10 years $124; for 15 years $91; for 20 years $75; for 25 years $65. Thus it is that by paying the annual rate of 6½ per cent without any other commission or expense the borrower will keep up his interest and pay off the debt in 25 years. Counting commissions 6½ per cent is about the current rate farmers are now paying for five-year loans and at the end of the time their debt is just as large as when first made.

The state is to be divided into districts and a land appraiser will be appointed for each district by the bank commissioner subject to the approval of the board. These appraisers will receive a salary of $2000 a year and their business will be to examine and appraise the land and make his report under oath. The title is to be examined by the Prosecuting Attorney of the county and then approved by the Attorney General.

All services rendered by public officers are without further pay than that they now receive. The State Bank Commissioner is named as trustee and in case of foreclosure he acts without commission.

For working capital the Legislature will appropriate out of money in the treasury one million dollars. When the bank shall have loaned five hundred thousand dollars it will sell debenture bonds never to exceed the amount of the notes secured by deeds of trust. Bonds to the amount of forty million dollars based on the original capital may be issued and further issues may be made at a ratio of thirty dollars of bonds to one dollar of reserve. Bonds are exempt from state, county and municipal taxation.

To create a reserve fund the borrower is charged one-half of one per cent annually during the currency of the loan and out of this all expenses and loss if any shall be paid. Whenever this reserve fund becomes sufficiently large the Legislature is authorized to provide for the repayment to the state of the working capital.

The rate of interest fixed for the first $500,000 loaned shall be 4.3 per cent and after that the rate will depend upon the rate for which the bank can sell the bonds. With bonds selling at par drawing 4.3 per cent interest the annual payment the borrower will be required to make on a twenty-five year loan will be 6.5 per cent and on a twenty-year loan it will be 7.5 per cent. A borrower can pay off his debt in twenty to twenty-five years at the same rate he is now paying for in-

(Continued on page 9)

These Two Structures Were Built of Exactly the Same Material.

THIS trestle carries trains weighing hundreds of tons each, day after day, year in and year out. In building it, the engineers used wood they knew, from test and experience, to be strong enough to carry the load, and durable enough to last.

The builder of that silo had to consider strength and durability, just as the bridge builder considered it.

But the silo man also had to be sure that his material would insure the proper fermentation of newly packed silage—that it would make the best silage.

Bridge builder and silo builder—both selected the same material—

Southern Yellow Pine

READ THESE PROOFS—*Here's the Proof of Yellow Pine's Strength*, as shown by comparative tests made by the U. S Forest Service and the figures reproduced in R. S. Kellogg's "Lumber and Its Uses," 1914, a standard work on forest products. The table shows the relative breaking strength and crushing strength of the woods listed, the tests all having been made from selected pieces of perfect wood of the same size.

Woods Tested	Breaking Strength	Crushing Strength
Long Leaf Yellow Pine	*8,630*	*4,280*
White Oak	8,160	3,510
Beech	8,160	3,280
Slippery Elm	7,710	3,180
Post Oak	7,380	3,330
Cypress	7,110	3,960
Douglas Fir	6,340	2,920
Hemlock, Eastern	6,180	3,270
Black Ash	6,000	2,300
Silver Maple	5,820	2,490
Spruce, Red	5,710	2,760
Red Cherry	5,040	2,170

Here's what an unbiased silo expert says in Bulletin No. 70, 1912, Agricultural Experiment Station, Storrs, Connecticut:

"A round, wooden-stave silo, taking all things into consideration, has proved most satisfactory. . . . Silage keeps best against wood and nothing is lost around the edges."

There are the facts. Consider them for yourself. Then consider the low cost of the Southern Yellow Pine silo, its unequaled qualities as a container. Couple that with its strength and durability, and figure out for yourself whether a Southern Yellow Pine silo isn't the silo that is best for your pocket-book, and best for your silage.

We have no silos to sell you—there are a number of first class Southern Yellow Pine silos made, and you'll make no mistake in any of them.

Send for Our Free Silo Book

We have, however, a Silo Book, all about silo building and using, and all *fact*, backed by reports from government and state authorities. That book is absolutely free to you if you will send us your name and address. Also, we have carefully prepared plans for model barns, cattle sheds, poultry houses, feed racks, granaries, and other farm buildings, complete with lumber bills, cost estimates, etc. These, too, are free to you for the asking. Whatever the information you may want concerning lumber, write us personally, and you will receive a prompt personal answer.

PROPER PLACE FOR GREEN MANURE

Several weeks past I sent The Missouri Farmer a few lines that were published in the issue of March 15th under the heading "Green Crops for Soil Maintenance" and I note with pleasure the editor's comment on same under the heading "Two Systems of Farming." I do not know where the editor gathered the idea that in my comments I was advocating an absolute system of grain farming and relying on green manures to preserve and increase fertility in our lands. Certainly such a system was furthest from my thoughts when I penned the lines published. What I had in mind was calling attention to the indifference and lack of knowledge of the benefits of green manuring for preserving and increasing fertility as shown by the common practices of our farmers and the general silence on the subject by the agricultural press.

I am adding these few lines commenting on the editor's remarks as called forth by my article not with the idea of entering into a controversy but with an earnest desire to impress upon the readers of The Missouri Farmer a fuller conception of the benefits and profits to be derived from a better understanding and a larger practice of green manuring. I can fully commend the advice to feed more live stock, provided it can be done at a profit, but when conditions are such that there is no profit or when it is impossible to get funds to finance cattle raising, the advice to feed more stock must fall on exceedingly bare ground, and if cattle cannot be had to feed through lack of funds or if the feeding shows no profit on the operation there will be very little incentive to repeat the performance and in either of the above cases where is the manure to come from to maintain and increase fertility? Where the above conditions apply green manures step in and keep out the broken down system of live stock farming advocated.

This matter of financing cattle growing (which I take it to be understood where mention is made of rolling lands which can only be used profitably for pasturing stock) is a vital fact in any system of live stock farming where the farmer is not well-to-do. Any one who has tried during the last two or three years to finance a bunch of this stuff for a time long enough to insure proper returns on the investment knows the hopelessness of the task; where funds are available six months is the limit of time granted, and while this length of time might be sufficient to take a gambler's chance in feeding a bunch of stock, it does not begin to be of any use to the person wanting to grow cattle to use summer pasturage.

Until financial conditions change or suitable provisions are made for financing cattle operations extending over periods of two or three years all the preaching in the world will have little effect in increasing cattle growing because you are up against a fact, not a theory, and too many farmers have been bitten by this six months fact to be caught again with the same trap. Against the difficulties and uncertainties of live stock production at the present time we have an era of high prices for grains and feeds; the natural tendency among farmers being towards producing as much of these crops that can be turned for cash as possible.

The above seems a long way from advocating the use of green manures, it is recited however to show how especially at the present time the continual reiteration in the farm press of the necessity for keeping more stock for preserving and increasing fertility is going to be a waste of space and ink until financial conditions change for the better or provisions are made so that cattle raising can be financed on long term loans and at better rates than prevail generally throughout the country at the present time.

On well established live stock farms where ample capital is present for carrying on the operations of growing and feeding cattle green manuring can be used to supplement and help out the supply of barnyard manure; crops must be grown to feed the cattle and if through the use of green manures these feed crops can be increased it has the effect of lessening their cost, thus enabling the cattle to be fed more economically, giving a greater chance for making a profit on their handling. The use of all of the barnyard manure that it is possible to get at a fair price is advisable, but even on the best of live stock farms where maximum numbers of stock are kept and the best possible use made of the manures produced the supply is insufficient. If the question was put to the operators "Could you use more manure if you had it?" how many would answer No. I venture to say that without exception the reply would be that they could use more manure. If this is the case on the most heavily stocked farms, how much more is the need of fertility on the average farm where but the work stock and a few head of milk cows are kept and when financial conditions preclude the handling of more stock? The advice to keep more stock to such a farmer is fatuous, generally in the first place financial conditions are against getting the stock, secondly there are no adequate facilities for handling stock such as barns and sheds; thirdly, the farms as a rule are not fenced for stock and very little pasture available, such as there is being principally a weedy growth, and lastly it is taking about everything that can be squeezed out of the soil to satisfy the landlord or pay interest, taxes and running expenses.

My sympathies are with the average man on the average farm. I know from experience what he is up against when he tackles the problem of increasing the production of his acres, that have been systematically robbed for fifty or seventy-five years; having been up against this problem myself and having tackled it with thousands of tons of manure and hundreds of green crops turned under, I think that I am in a position to speak with a little authority as to the most economical method of getting available fertility back into our worn soils; my advice is to use all the stable manure possible, but put your main reliance in green crops turned under.

The time is here when most of our soils must have some of the mineral elements returned to them for best results but this applies whether we use manure or green crops for increasing the humus and nitrogen contents of our soils; the problem is to increase the available fertility of our soils in the cheapest and quickest possible manner and it must be approached in a business-like way taking all factors into consideration. When this is done I have no doubt but that green manuring will come into its own and it was only to be of assistance and encouragement to the average farmer on the average farm that I penned the few lines that the editor was kind enough to publish.

PAYING OFF THE MORTGAGE

"Why the farmer does not make more money." That is a subject we are all interested in. There are a lot of whys as I view it. In the first place it takes as much capital to improve and stock an up-to-date Missouri farm as it would to buy the land ten or fifteen years ago. There is also a lack of interest in the business by too many farmers. There are men farming a lot of good Missouri land who claim they can not make interest on land valued at from $70 to $100 an acre. I believe that if the farms are looked after closely just as the merchant or banker looks after his business and we will give the land a better crop rotation system, and keep as much live stock as possible, it would help to make the farm pay.

I am operating a farm of 320 acres and I know we have had a lot of ups and downs in the last four years. We have had one good crop year and three failures, two together in 1913-14—with only about one-fourth crop of oats and hay and less than one-half crop of corn but fair yield of wheat each year.

Three years ago I put up an Oregon fir silo 14 by 32 feet with a 4-foot concrete base making it 14 by 36 feet. I found it more than satisfactory. Last fall I put up one of the same kind 16 by 32 feet, including basement. I have wintered 91 head of cattle and horses —most of this stock is two years old and over. The principal feed was silage. My cattle are in fine shape. I have been using a little wheat straw and some cane or fodder as a dry roughage but it takes very little. I have not bought any feed, only 90 barrels (450 bushels) of corn to finish a bunch of hogs. All know who have fed hogs this winter that it goes without profit.

Now I will not only have feed to winter this stock but expect to put them on grass and keep them on the place, if we can have a normal season, until fall, then I will feed 73 cattle. I expect to raise the corn that they will eat with the assistance of one hired man. The only product that will be bought will be cotton seed meal to help finish the cattle. I take this method of handling my stock in order that I can some times meet a bad market yet have some profit. Not only the profit but one has employment for his help all the time in winter same as summer. We feed in the barns in winter for in that way the manure that accumulates will spread over a good patch of land each year.

With the high prices of grain we must produce more feed and buy less. We must grow feed that will put growth on our young stock and cheapen production on all classes—sheep, hogs, cattle, horses and mules. We can do it better by the use of silos than any one thing I know of. In dry seasons like we have just gone through, cowpeas and millet are good but you will find 15 or 20 acres of corn in a silo will feed more stock than the same acreage in anything else. If men who like farming will give close attention to their vocation I believe there is a good living and a fair rate of interest. There is an old axiom that, "He who would by farming thrive must either hold the plow or drive," and the time has come when we farmers had better do both.

R. P. Reid, Boone County.

Editor's Comment: Mr. Reid is another of those farmers who took hold of a farm a few years ago with a mortgage and in spite of drouths and other discouraging things farmers have been contending with, the mortgage has been paid off. Like most of our readers who have expressed themselves on this subject, he has made his money handling live stock. And like others who have written he thinks the secret of success on the farm is close attention to business and a love for the work.

THE COUNTRY CHURCH

We are now hearing a great deal of criticism, both friendly and unfriendly, in regard to the present existing social conditions generally found in the country.

Few, however, are able to offer a reasonable remedy, one that appeals to the farmer folk as being better than those customs and practices which have so firmly attached themselves to us in the past generations. Times have changed and we too must change if we are to keep pace with the progress of our friends in town and city and at the same time so interest our boys and girls in farm life that they will want to stay on the farm. We would not be so narrow minded as to say that all should stay (for square pegs never fit in round holes), but when their natural inclination is for farm life, it is little less than criminal for us to force them to the town or city for congenial social, intellectual or spiritual environment.

The community interest plan will solve the problem. Who better at the head of that work than a live, wide-awake, progressive, resident minister? Where a better community meeting place than the community church? Not the usual 24x36, box building, warmed by one stove in the middle of the room, common the country over, but a modern building, up-to-date, complete in every detail with light and heating plants, class rooms, reading rooms, manual training rooms, gymnasium, etc., second to none to be found in the town. The best is none too good for farmer folk. Provide such a place, open to the public seven days of each week, put a proper person in charge, give it your support and you need not worry about your boys and girls leaving the old homestead to find recrea-

tion and amusement in town or city.

The one-fourth time preaching must go if we are to progress as we should and live up to our possibilities. The time was when it served very well but that time is past. We are paying for one-fourth time work but not getting it, only Sunday sermons when what we need is pastoral work. The common practice of preachers coming into our midst Saturday night, preaching two Sunday sermons and gone again until the following month, is just a little better than none. I am almost persuaded to believe it is worse than none at all for then we would come alive, get busy, and organize a live, up-to-date church. Too many country preachers seem to think that when they have delivered two Sunday sermons that that is all that is required of them. They have done about all they are paid to do I am sorry to say, when in reality that service is only a small part of what they really (as real pastors) should do. Imagine if you can the city pastor after having delivered his Sunday sermons, calmly sitting down and waiting for the next Sunday service, and then two more. How long would he stay? And yet we are up against that very sort of preaching service. Under this one-fourth time non-resident plan the preacher cannot possibly get in touch with his people. He is not of use, does not belong to the community and cannot possibly get our viewpoint. He may be earning all he gets but we certainly are not getting value received.

That old-time fallacy of not being able to support a resident pastor is a delusion and a snare. We can, if we will. We must if we are to advance. What we need is men on the field, every day and on Sunday, resident workers, men who are a part of the community, who can see from our viewpoint and co-operate with us in solving our problems. There is a mission field in the open country, whose possibilities for a golden harvest of men's lives has scarcely been touched. We hear of young preachers leaving for broader fields of usefulness when they haven't even scratched the surface soil in their present field of opportunity.

Would that there were more real, genuine, country pastors, who were willing to cast their lot and stand or fall with us in this our grand work of saving for lives of usefulness and honor that most valuable product, that priceless product, the boys and girls of the farm.

J. H. Smoot,
Thompson, Mo.

SPRING CARE OF WORK HORSES AND MULES

The efficiency of work horses and mules in the spring depends much upon feeding and care. A day's work with a pair of horses or mules is usually worth more during the busy spring season and they are usually less fit to do their best work at this season than at any other time of the year.

For best results, work horses and mules should have been accustomed to the harness, daily work and a reasonable work-horse ration before the beginning of the spring work. A small quantity of feed fed before the season opens means greater efficiency of horses and mules through the early days of the busy season.

Continued heavy work demands nutritious feed. Corn and timothy are in most cases, the available food stuffs. This ration can be greatly improved by the addition of one or two pounds of oil meal per day. Where brood mares are used 2 to 4 pounds of bran per day is a valuable addition. Animals at heavy work should have more grain and less hay than when idle or doing light work. The conditions of animals should be the basis for judging the efficiency of rations. Horses doing hard work will require from 1 to 1⅓ pound of grain and three-fourths to one pound of hay per hundred pounds live weight per day. Mules will require slightly less grain and more hay. Men feeding horses and mules should adapt the ration to the animals so as to produce and maintain the best working condition.

Regularity in feeding and watering make for economy and satisfactory results. Regular grooming to remove heavy winter coats and dry sweat lessens the danger of pneumonia and other sickness besides making the teams more efficient. Clipping should not in most cases be necessary, but is occasionally advisable. Harness properly fitted makes possible greater service, less energy and worry. Well fitted collars are especially important since they prevent collar boils and other shoulder troubles.

The collars used should always have ample bearing surface. Perspiration should never be scraped off the collar with a jack-knife, but should be rubbed off with a moist cloth which will leave the surface perfectly smooth. The use of sweat pads is unnecessary unless the collars fit poorly. Experience at the Missouri Agricultural Experiment Station indicates that horses or mules reasonably hardened for work in reasonable condition, with good coats, with proper fitting harness, with good wholesome food, when used with good judgment on the part of the man in charge should reduce the difficulties of spring work to a minimum.

E. H. Hughes,
Instructor in Animal Husbandry.

WHEAT HAY

In the northwest they cut wheat and barley for hay. Last year there was a poor prospect for hay and wheat looked like a good yield and a possible price of seventy-five cents. I thought an acre of hay would be worth as much as an acre of wheat, so I cut some for hay. Cut when it is in the dough or just after blooming it keeps all the blades and hence weighs more. I think it made about three tons per acre. Wheat threshed about 21 bushels per acre which at 70 cents, the price at that time, was $14.70. So my hay cost me less than five dollars per ton and as good as any hay I ever fed. My only regret is I didn't cut more. It should be let lay longer than timothy then raked and put in cocks and let stand awhile. If properly shocked it turns water well. It doesn't cure out quite as well as timothy and clover in the barn, hence the necessity of shocking it for a few days.

Pam R. Grinstead, Pettis County.

Soybeans planted in the corn may afford protection against chinch bugs and they have many other advantages worthy of your consideration.

COWPEAS DRILLED IN CORN AT THE LAST CULTIVATION FOR GREEN MANURE
University of Missouri, Soil Experiment Field, Audrain County

A bushel of cowpeas planted on three or four acres and cultivated will make more seed than you will need to plant another year.

The Telephone Unites the Nation

AT this time, our country looms large on the world horizon as an example of the popular faith in the underlying principles of the republic.

We are truly one people in all that the forefathers, in their most exalted moments, meant by that phrase.

In making us a homogeneous people, the railroad, the telegraph and the telephone have been important factors. They have facilitated communication and intervisiting, bringing us closer together, giving us a better understanding and promoting more intimate relations.

The telephone has played its part as the situation has required. That it should have been planned for its present usefulness is as wonderful as that the vision of the forefathers should have beheld the nation as it is today.

At first, the telephone was the voice of the community. As the population increased and its interests grew more varied, the larger task of the telephone was to connect the communities and keep all the people in touch, regardless of local conditions or distance.

The need that the service should be universal was just as great as that there should be a common language. This need defined the duty of the Bell System.

Inspired by this need and repeatedly aided by new inventions and improvements, the Bell System has become the welder of the nation. It has made the continent a community.

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

An hour or two riding on the road drag after every rain will make your buggy springs seem a lot softer when you go to town or to church.

Were we asked what implement on the farm would pay the greatest per cent on its cost we would answer the King road drag. With only a few hour's labor and without one dollar of expense you can make a drag that will add a thousand per cent to the pleasure you get out of a buggy or automobile ride.

—o—

Remember that cultivation is fertility boiled down. Corn roots can not extract fertility from a clod and no more from a vacuum. It matters not how much fertility there is in our soil unless we put it in shape so the fine plant roots can use it we might as well lock it up in a box.

—o—

It will not pay to get in such a hurry to plant corn that we neglect the thorough preparation of the seed bed. One of the most profitable workings for spring planted crops is the disking of the land before plowing. This disking cuts up the stalks and other coarse litter and incorporates it with the soil and then by fining the soil that is turned to the bottom of the furrow it is not necessary to work the plowed ground so deep. It pays to thoroughly disk the corn land before and after plowing.

—o—

The most expensive element of plant food is nitrogen and the air above and about us is largely composed of nitrogen we can have without cost if we will accept it. Clover, alfalfa, cowpeas, soybeans and other plants will extract the nitrogen from the air and store it in the soil for the use of other crops if we will occasionally plant these legume crops. As these crops are all profitable to grow and help to balance up the other feeds raised on the farm why not raise more of them and get the use of this free nitrogen to increase the yield of our wheat, oats and corn?

—o—

A few farmers have found it profitable to grow cowpeas and soybeans for seed purposes and there should be a great many more doing the same thing. Just now our seed stores are full of these seeds grown in the south and there is no good reason why every bushel of them should not be grown in Missouri. The retail price is now from $2.25 to $3 a bushel and thousands of dollars will go out of the state this year and does every year that might be kept at home with very little effort. A yield of from 12 to 20 bushels per acre at present prices with the hay crop thrown in looks pretty good when compared to the average corn crop.

—o—

We have had a great deal to say about alfalfa in these columns but one of our good farmers said to us the other day we had not said half enough about this most wonderful crop. And we think he was about right. Alfalfa is not only one of the very richest stock foods among forage plants but it is one of the best crops we can grow for the improvement of the soil. This is because of its power to draw nitrogen from the air and because of its very deep root growth it feeds on the subsoil too deep for other crops to reach. Then when the rains fall and are washing tons of fertility off the hillsides cultivated in corn, the deep spreading roots of alfalfa hold the soil intact and convert the fertility into hay worth more than the average corn crop. Then why not grow alfalfa and stop the hillside wash?

—o—

Few men ever discover a real new idea. Few men have the patience and persistency to dig deep enough to find new ideas and so when we learn of a man who has really discovered something new we like to make note of it. One of the difficulties in getting a stand of sweet clover, a crop just coming into prominence, has been in finding a way to germinate the hard shelled seeds found in so much of the seed stock. For eight years a professor in the Iowa Experiment Station has been patiently working to find some way to break up these hard seed coats so that the seeds would grow when planted. He has at last succeeded in inventing a machine that will scarify the seeds so they will germinate as readily as any other seeds and that will eliminate one of the worst difficulties in growing sweet clover. The man is H. D. Hughes, of the Iowa Experiment Station, formerly with the Missouri Station, who is accorded this honor. When ordering sweet clover seed don't fail to demand scarified seed.

—o—

USE YOUR CLUB

We have been talking a great deal of late about the value of organization among farmers and we think our readers are fully awake to the value of some organized effort in the local communty as well as from the larger territory of the state and the nation. Many of the big questions affecting farmers' interests can be handled only by state and national organizations but before we can have these large and powerful bodies we must have the small working units in the country districts. In Missouri we have already a great many local organizations but too many of them seem to be waiting for the state to be organized as a whole before they get into the game. We think it is unfortunate that the plan of organization is so much divided in this state for it prevents that solid team work so necessary in accomplishing anything worth while. We have the grange, the farmers' union and the improvement clubs all with good men at the head of them and all doing good work in a small way but the farmers of this state will never get the full benefit of their team strength until we have one state wide organization or at least a state federation of all the various organizations working in the interest of farmers.

But while we are waiting for this state-wide organization why not try to get all the good we can out of our local club? And by local club we mean any form of society whether it be grange, farmers' union, co-operative creamery, co-operative grain marketing, or the neighborhood farmers' club. None of these organizations has more than skimmed the surface of the possibilities of what can be done in farm betterment. If these local clubs will take up the work according to the plan recently outlined in The Missouri Farmer a great deal of good will be accomplished locally and the bigger things will come when we are ready for them. The club which has active standing committees who keep informed on all questions relating to production such as the best varieties, adaptability of new crops, best fertilizers to use, deep or shallow plowing and cultivation; and questions of marketing such as where to sell, when to sell, how to standardize and pack the products; and how to buy, where and when to buy to best advantage; the club which takes these and other matters up in this thorough way will get the most out of its organization and will be ready to join hands with a state wide organization when we are ready for it.

—o—

HAY—$20 A TON

Whether it means western alfalfa or northern timothy the above caption, which may be found tacked on the wall of hundreds of warehouses where feed is sold in Missouri, has driven home to thousands of farmers the chill of desperation during the last few weeks. Under such conditions it is not strange that men will complain that there is no money in growing and feeding live stock. In a recent trip across the state we saw thousands of acres of last year's corn fields with the old stalks yet standing and not a hay stack in sight. Here and there might be seen a field bare of stalks and at the barn a silo full of succulent forage which was saving the $20-A-Ton the other fellows were paying for hay.

There are at least two classes of men who have escaped the $20-A-Ton affliction and they are the men who had a silo or a field of alfalfa.

It is none too early now to begin planning for a silo or a field of alfalfa if you have not already both of them on the farm. It is not our policy to recommend any one kind of silo to the exclusion of others but from the abundant information we gain from farmers from time to time and from reliable data from experiment stations the individual farmer should decide according to local conditions what is the best silo to build. Land is too high priced and the cost of cultivating it too much to allow such a large part of the crop as is contained in the corn stalks to go to waste. To allow corn stalks to rot in the field is one prolific cause of "why farming don't pay."

Our reports show that farmers who have secured a good stand of alfalfa have been getting a yield of anywhere from two to six tons per acre yearly according to the fertility of the soil. Few report a yield so low as two tons and the general average will run about three and a half tons obtained from three to four cuttings. Alfalfa is a great drouth resister after it is once well established because of its deep root growth and at least a few acres on every farm would be a pretty good insurance against another hay shortage in Missouri.

We would like to see the above two propositions, that is "a silo at every barn and alfalfa on every farm" taken up as community measures all over the state. Why not at some convenient time in the near future call a meeting and ask the state board of agriculture and the College of Agriculture to co-operate by sending their best speakers to help and have a thorough discussion of both questions. The silo and alfalfa are not only good in drouth years but they are good for the live stock farmer in any year and more of both should be seen in every county in the state.

—o—

NOT A GOOD CUSTOMER

In a recent number of The Missouri Farmer we published an article from a successful Jasper County farmer stating among other things that the grocerymen of his town did not consider him a good customer because most every time he came to town he brought something to sell and that he demanded a fair price for it. Furthermore, this farmer did not buy much of grocerymen for the very good reason that his family table was abundantly supplied from his own garden, orchard, fields and poultry and feed lots. There is no good reason why it should be otherwise with any farmer in Missouri. One acre in a variety of fruits, thoroughly cultivated, will supply the table of the average family with an adequate supply of choice fruits the year around. One acre culticated in potatoes, sweet corn and other vegetables will furnish the table with a better quality and variety than it is possible for any city family to enjoy even at any price. Fortunate indeed is the man who is considered a poor customer for the groceryman just because he is thrifty enough to supply his table from his own soil.

Missouri farmers would be several million dollars ahead every year if they produced all the vegetables and fruits consumed on the farm and this could easily be done with several million dollars to sell city people if every farmer raised a good garden. Most every day we see farmer's wagons loading up from the grocery stores with white potatoes, sweet potatoes, beans, canned goods of all kinds and all these can be produced as abundantly and as cheaply and of as good quality as may be grown any where in the world. It may be that the big farmer with a good bank account can afford to buy the fruits and vegetables for his table if he can content himself to eat from a tin can or of the wilted vegetables found in the stores, but most farmers cannot afford to do that and the only alternative is to raise a good garden of your own.

—o—

CO-OPERATIVE MARKETING

If farmers would co-operate by counties just for the marketing of surplus products which do not find a ready sale as well as for many articles which ordinarily have ready sale, they would find it of advantage to hundreds both as seller and buyer. In those counties having county agents an exchange could be maintained through the county agent's office with very little expense and in counties where there is no agent arrangements could be made to maintain an exchange with one person in charge and the expense paid from comissions on sales. A weekly or monthly list of things for sale and things wanted could be printed and sent to members and the buyer and seller brought together at very little cost. While we are complaining about the high cost of living and the increased expenses of farming why not adopt some of these simple methods and cut out unnecessary expenses?

CHEAPER FARM LOANS

(Continued from page 5)

terest only. This will be a great incentive to land ownership.

By the state mobilizing the farmers' credit the borrower is enabled to get his loan at the lowest possible rate of interest and at the same time it is not costing the state a penny because all expenses are to be paid out of the commission of one-half of one per cent which the borrower pays annually.

Some of the beneficial effects of this law will be to encourage men to own the land they cultivate or in other words to become home builders. It should encourage men who now own land needing drainage or clearing of timber to put it in cultivation. It should encourage men to handle more live stock, improve the fertility of the land and build better houses, barns, silos, fences and other improvements.

In a short time petitions will be circulated asking for the submission of a constitutional amendment permitting the establishing of such a system of rural credits and we trust our readers will thoroughly study this proposition so as to be ready to act on the petition and also to vote on the question when submitted at the next general election in 1916. Let us have a full and complete discussion through the columns of The Missouri Farmer.

BARNYARD GOSSIP

What a great help it would be to the editors of a paper like The Missouri Farmer if they could occasionally have an opportunity to sit around the fireside of the homes of its readers and have a friendly talk with them. True we have a chance to talk "at" our readers every issue and occasionally some of them talk back "at" us through their articles but this is not like it would be if we could meet "face to face" and talk it over "heart to heart" until we understood each other better. Estimating that only three persons read each copy of The Missouri Farmer that means that the editors have an audience of one hundred and fifty thousand good people to talk to twice a month. Among the farmers on our list some own large farms, some small ones, while others are tenant farmers and a few are hired farmers. About one-third of these farmers own their land free from debt, another third is made up of men struggling to pay off a mortgage and the final third is made up of hired managers and renters, many of whom have little hopes of ever owning any land at all. Some of these men are farming land originally prairie, others land originally timber, some cultivate level lands needing drainage, others hillsides where it is necessary to check washing away of the soil. There are hundreds of other things causing one farm to differ from another and these are the things we could have a better understanding about if we could talk to our readers face to face. The editor as a rule must talk in a very general way and the reader must be able to take for himself only the facts which will apply or fit in under his own particular conditions. The man who is able to understand this will get more good out of what he reads and will not as a rule have so much fault to find with what the editor has to say.

—o—

The policy of a paper should be sound, that is it should be such as to serve in the best possible way the interest of its subscribers. But sometimes the interests of subscribers may conflict, then what is the editor to do? No man can serve two masters. In such cases as in all others the editor must be honest and sincere and this must be backed up by knowledge and experience to enable him to point out the best way. The editor of a paper can not afford to advocate a thing just because it is popular—just because for the time being at least he may think it will agree with his readers. The politician does that and the politician is not long in good repute with the people. On the other hand the statesman, in contrast with the politician, tries to be right and would rather be right than to hold office. The politician never hesitates to sacrifice principle for power but the statesman stands for the right regardless of consequences to himself.

—o—

Every day in an office like The Missouri Farmer a great many letters are received. In our office the mail is delivered five times a day and if we fail to get quite a number of letters in every delivery we think something is wrong—that there has been a werck on the railroad or possibly a late train missed connection. With this large number of letters, then, coming from so many different localities and from so many different people each one differing from every other one about something—we repeat that under these conditions the editor must try very hard and very conscientiously to be right rather than to try to please, albeit he is as anxious as any other honest man to please. In methods of farming no man can sit in an office and prescribe rules that will fit in all conditions and yet he may be able to point out certain things to be avoided and others to be followed that will be of great value to his readers.

—o—

We have frequently pointed out the wonderful and varied resources of Missouri and we think it is a fact apparent to any one familiar with our natural resources of soil and climate, forest and mine that all that this state needs to become the richest and foremost in the Union is for all industries to co-operate and for us all in whatever capacity we may work, to show the true Missouri spirit. Good towns make good markets for the products of the farm and without good markets there can be no prosperity for farmers. Hence the farmer is interested in everything that helps to build up the town, whether it be the success of the business men, the manufacturer, the mining or the professional man. The thing to do as I see it for farmers to promote their own interests and at the same time the welfare of the state as a whole is first to get rid of our prejudicies. No man can see or think clearly who is biased by prejudice. But after we get rid of our prejudice against other classes we will find it necessary to get rid of our selfishness as individuals so that we will be ready to join hands with our neighbors in any movement for the betterment of society in any way. When we do this we are ready to work for the public good and when we do that we are working for our own good. No man ever helped his community or himself by opposing a public improvement simply because it will cost something. Comfortable clothing, wholesome food and pure water all cost something, but what would life be worth without them? Good schools and good roads, are the two first and greatest needs for the improvement of farm life but they will cost something—not so much though but what we can afford them and they will be worth all they cost.

CORN

wants what it wants — when it wants it.

THE "Breeder's Gazette", January 21st, says,—"There are times when quick action is a straight road to profits. If there ever was a time in our agricultural history when bumper yields should be assiduously sought it is in this year of 1915."

No matter how rich your soil,—no matter how much phosphorus you may have in it or may have applied in raw rock, for this year's crop, you need this year's plant food,—the quickly available kind, all ready to nourish the corn and wheat, to mature the bumper crop in time for the bumper price.

Empire Heavycrop

Supplies this kind of available plant food,—available phosphorus, available nitrogen and available potash. According to soil experts, all these are needed in most soils, and in this brand we furnish them in an available form. Remember, wheat and corn do their principal feeding in 60 days and they "want what they want when they want it."

TRY-A-BAG. Cover an acre for $1.50 to $3.00. See for yourself the value of available plant food. Make every acre worth two. Get the best results from your cultivation and rotation. Get our price on any quantity you want, from one bag upwards, shipped to your own freight station. Get our agency proposition and carload inducement. Write for our interesting booklets "King Corn" and "Better crops",—both are free. Write today and have it off your mind.

GREAT WESTERN

EVERGREEN BAG WORM

Mr. J. F. Hoffmeister of Barton County sends a sample of the "evergreen bag worm" which he says is infesting his trees and wants to know what it is and how to get rid of it. The following reply is by Professor Leonard Haseman, entomologist, University of Missouri.

The sample which you sent to The Missouri Farmer has been referred to me for examination. These peculiar cacoon-like objects are produced by a caterpillar which we call the "Evergreen Bag Worm." This caterpillar feeds on the foliage of fruit trees, shade trees and shrubs, besides attacking evergreens. A few years ago this pest was a severe scourge in your section of the state but for the last year or two it has not done much damage. It is usually attacked by a number of parasitic insects, which under normal conditions, keep it well under control, but when it breeds in large numbers and threatens to destroy the foliage of trees, a prompt application of a poison spray to the infested trees or shrubs will quickly destroy the young caterpillars before they have done much damage. The pest can also be controlled by simply collecting and destroying all of these bags during the winter when they can easily be seen attached to the limbs and twigs. The pest winters in the egg stage inside a large case and at the approach of spring the eggs hatch and the little caterpillars spread in all directions where they begin to feed on the foliage and at once they manufacture a tiny case which is carried about with them during the summer. While feeding the worm extends its head out of the tip of the case and as soon as disturbed it jerks back inside and closes the end of the case with its legs and mouth. Some of the larger parasitic insects, however, make use of a sharp drill by drilling holes through the case and into the body of the enclosed pest where eggs are laid which on hatching devour the pest.

BROWN FENCE — DIRECT FROM FACTORY — WE PAY FREIGHT

Over 150 styles for every purpose—hogs sheep, poultry, rabbits, horses cattle. Also lawn fence and gates.

Exchange Seeds

If you are in need of seed at once, and desire to purchase it direct, do not fail to write the Secretary of the Missouri Farmers' Exchange, Columbia, Mo. The members of the Exchange now have a supply of the following for sale: **Seed Corn, Cowpeas, Soy Beans, Clover, Alfalfa,** and other seeds, as well as livestock, labor, etc.

This is a good year to make every acre count. Plant something in every available place.

Inoculate Clover, Alfalfa

Peas, Beans, Vetch and All Other Legumes. Get a "catch"—bigger yield—greatest feeding value—richer soil. Treat your seed with

THE IMPROVED GERMAN SOIL INOCULATOR NOBBE-HILTNER PROCESS

NITRAGIN PURE CULTURE

THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES

AWARDED GOLD MEDAL, ST. LOUIS, 1904

A **granular** medium, packed in ventilated cans. Vitality and virulence of germs **guaranteed for 6 months.** Avoid imitations. Get the **original.** Look for the **Armour Oval Label** on can. **See your seed dealer** or write for free booklet.

FARM MANAGEMENT PAGE

D. H. Doane, University of Missouri

A certain amount of opposition is a great help to a man. Kites rise against and not with the wind.

I have learned that success is to be measured not so much by the position that one has reached in life as by the obstacles which he has overcome while trying to succeed.—Booker T. Washington.

For Sale

Seed Corn—$80 a bushel. Apply to Missouri's Best Seed Corn Raisers.

I wonder how many will purchase seed corn at $80 a bushel for this year's crop. My guess will be none. The main reason will be that you can get first-class seed corn for a small fraction of this price. The real question is, "Is a good bushel of seed corn worth $80?" Let's view the facts. In southwest Missouri the Agricultural College tried a simple little test. They went through the country at corn planting time and selected from the corn planter boxes handfuls of corn. These samples, as you can see, were samples of corn that were actually being planted. They were taken to a test field and planted the same day, in the same way, and on the same kind of soil beside corn from the Agricultural College—"educated corn" the farmers called it. Throughout the season each plot was treated the same and all conditions made as near alike as possible. Here is the result:

The average yield of the three poorest samples of corn taken from the planter boxes made twenty-one bushels of corn to the acre. The sample of the educated corn made forty-one bushels to the acre. Difference, twenty bushels. Now let's see where the $80 comes in. If one bushel of seed will plant eight acres, and if the good seed will increase the yield, as it did in this case, twenty bushels to the acre, then eight time twenty is 160. 160 bushels of corn at fifty cents a bushel comes to $80. **For Sale—Seed Corn—$80 a bushel.** Ask yourself if it would pay.

Chinch Bugs—Corn—Soy Beans

Chinch bugs like corn, but corn cannot say as much and as a consequence they do not thrive well together.

Chinch bugs do not like soy beans; consequently, the former will not associate with the latter. This reasoning led some farmers to put soy beans in their corn to keep the chinch bugs out. It worked. Will you be one of the few this year to help us prove the truthfulness or fallacy of this statement? We are going to work on this problem this coming year and your experience would be worth while to us. Try it once.

What the Farm Advisers Tell Me

Cockefair of Green County said to a farmer in his county upon a recent visit: "That's a fine flock of White Rocks you have there." "Yes," the farmer replied, "Fine to look at but a mighty poor investment. They have not laid enough eggs this winter to pay for the litter they scratch in." "Would you be interested in trying the feed that has proven successful with me?" Cockefair asked. "Oh, I'll try anything; they can't do any worse than they have been doing." "All right, here it is: Bran, two pounds; shorts, two pounds; cottonseed meal, one and one-half pounds. I mix this together, moisten it and put it in a self-feeder and leave it before them all the time. Then, in the morning I throw out some cracked corn in the litter and the same in the evening. You see this bran-shorts-cottonseed meal mixture takes the place of the high-priced beef scrap, and my experience has been that I get about the same kind of results. For example, my hens made me a profit of twenty-five cents per hen, averaging the whole flock together during the month of January. If you think it's worth while you can try it.

A few weeks later. "Say, Smith," Cockefair asked, "how did that ration for your chickens work out?" "Well, sir," he replied, "those hens have laid more eggs since I started feeding that ration than they had during the whole previous winter. That one hint is worth a good many times the price of the Farm Bureau fee to me."

"Why are you cutting the trees out of that pasture?" Mr. Cook of Carroll County asked a successful cattle feeder. "Well, you see my observation has taught me this. When there are a few trees in a pasture the cattle gather in bunches around in this shade during the hot part of the day and stand there and attempt to fight the flies. As a result, they graze little and lose more flesh by crowding and standing around in this little patch of shade than they would if they were right out in the open. I am cutting all the trees out of all my pastures and as a result you will see that the cattle will not be so inclined to stand around in bunches and that they will graze more hours each day. I have given up the idea of shade for cattle in the pasture." "Well, that is a new idea to me," Cook remarked, "but I am going to see what other feeders say."

"Where are you going father?" "Up to Mexico to the Farm Bureau meeting." "What are you going to do?" "Well, we are trying to make arrangements to make it possible to keep Mr. Rusk. You know they are trying to get him for a Farm Adviser over in Illinois, and we are trying to keep him. Our County Court will not appropriate money for the expenses of the work in this county, and I am afraid we are going to lose Mr. Rusk." "Well, dad," the twelve-year-old boy remarked rather thoughtfully, and with a very sober face, "I will give all that mule colt of mine will bring if you will sell him and use the money to keep Mr. Rusk. He helped us boys get started in the corn club work and I do not want him to go to Illinois, so if you will sell my colt, you can have all the money for Mr. Rusk. (Too late. The farmers in Illinois are not kicking about the small cost of a county farm agent. They have offered Mr. Rusk more than $1000 more salary than he was getting here and he has accepted it. Why can Illinois afford to do it and Missouri can't?—Editor.)

The Small Tractor in Farm Practice

Under the above title Mr. A. P. Yerkes contributes his views through the Farm Management Monthly for the last issue. We hear so much about the use of the tractor on the small farms in the Corn Belt, that it seems to me his ideas are worth considering.

"To attempt to define the status of a machine which is undergoing so rapid a process of development as the farm tractor is difficult, as its status changes with each improvement or modification. Eighteen months ago the farm tractor was a comparatively large and expensive outfit and might truthfully have been said to have no place in the operation of the medium sized farm of the general type. Now, however, the type of tractor most prominent and apparently most in demand by the farmer is a small, low-priced outfit, capable of pulling from two to four plow bottoms, and with belt capacity sufficient to operate any of the machines commonly used on the average farm.

"These small tractors are of simpler construction than the large ones. Most of them have only one drive wheel and usually only one speed forward and one reverse, thus eliminating considerable gearing, including the differential gears. At the same time they permit the hitching of a two-bottom gang plow directly behind the center of draft of the machine, something which was impossible to accomplish with a wide tractor having two drive wheels without causing side draft or running the tractor partly on the plowed land.

"The mechanical features are not so important from the farmer's viewpoint, however, as its low price. The average farm already has as large an investment per acre for power as conditions will justify, and the purchase of a tractor which would not displace its money equivalent in other power would be unwise. As a tractor's working life in years is usually only about half that of a horse, it is evident that it should displace practically double its value in horses, if it displaces no other source of power. As a rule, however, the small tractor will take the place of a stationary engine for operating the various farm machines, and the difference in the cost of such a stationary engine and a small tractor is slight; so it will not always have to displace horses to any great extent to justify its purchase.

"Judging by data already obtained in a study of the small, low-priced tractor, it is safe to predict that it will soon command, on the ground of economy, a permanent place on the average farm. The degree of success which will be attained with a tractor depends very largely on its operation and the general management of the farm work so as to utilize it to the greatest advantage. Like every machine, its value is increased by being worn out as rapidly as possible in profitable work, as the interest charges are thereby reduced, and depreciation, through rust, etc., reduced to a minimum. The work of the farm should, therefore, be planned so as to use the tractor wherever practicable and to dispense with as many horses as possible. As the tractor will be capable of doing practically all the plowing on the average farm, the number of horses which must be kept will depend upon the amount of cultivation, etc., to be done, for which the tractor is not adapted. Where the tractor is used the cropping system should be planned to reduce this kind of work to a minimum."

A Two-Fold Use for the Manure Spreader

Mr. L. M. Morehouse makes the following suggestion on this subject. While not many of our farmers grow root crops, still there are certain kinds of crops that this idea will help us with. I have heard that some of the farmers have worked up some scheme whereby they have used the spreader for threshing out soy beans and cowpeas. I wonder how many of us have ever used the manure spreader for any purpose other than its original plans called for. It would be interesting to get some information on these points. Let's help each other along this line.

"Some of the implements which are found on almost every farm are used for very short periods each year. The length of service may not include more

Round trip to San Francisco

Los Angeles and San Diego only

$56.85

VIA WABASH

You never did have the opportunity to visit **two** world expositions for **one** fare—and at the same time see California. This extra low fare and the special privileges it gives you should induce you to make plans now to take this splendid trip. You can go

via Portland, Vancouver, Seattle and Tacoma, in one direction, for approximately only $17.50 extra.

That's another trip bargain worth thinking about. Take the matter up now with the undersigned. Both expositions are open and complete now. No need to put off your trip.

Wanted—Farmers!

Mayes County, Oklahoma, wants more farmers; good farmers to take advantage of her splendid opportunities.

Located in Northeastern Oklahoma, Mayes County produces corn, wheat, oats; dairy products; live stock. Has 40 inch rainfall. Good plow land, $20.00 to $50.00 per acre; pasture and hay land $2.00 up. Good schools. Trunk line railroad; low taxes. Write for up-to-date booklet, descriptive of the square deal proposition of the Mayes County Farm Bureau.

Special homeseeker's fares to Oklahoma on First & Third Tuesdays of each month.

THE MKT

than three or four weeks. For the remaining part of the year such pieces either remain in the open, or they may be given the best of care in a first-class implement shed. Where they are exposed to the weather a rapid decline in value is the result. Investigations have proven that the depreciation for the manure spreader is approximately 11.67 per cent annually. Owing to the fact that this machine is required to carry a by-product which contains more or less moisture, a part of the depreciation is undoubtedly due to the decay of the wood in the framework. If this and similar pieces could be utilized to a greater extent they should last almost as long, and in doing the additional work the yearly charge in connection with operation could be met more fully or completely. Ordinarily the manure spreader is in use at seasons of the year when the field work is not demanding attention. While the harvest is in progress it will be found idle; hence, it is available for other work.

"In districts where field roots such as mangolds, sugar beets, or turnips are grown, the manure spreader may serve as a wagon in transferring the crop from the field to the root cellar or pit. A simple adjustment will enable the operator to save considerable time, as well as the task of unloading with the aid of a shovel. The cylinder or spreader is first removed from the end of the box and a suitable end board is set in place, the latter being held by an iron bar or rod. When the load is taken to the cellar, the end board can be lifted out readily and the roots may be rolled into the trap door merely by putting on the crank which connects with the apron shaft and turning by hand until the entire lot has been discharged. It requires only a few moments to deliver the load. If the farmer does not have wagons enough to move the crop rapidly, this difficulty may be overcome by following the suggestion which has been offered."

The Small Farm

We have heard a great deal about the small farm. The idea of few acres well tilled has been quite prevalent. Investigation of the real facts has shown us some things quite different than we had anticipated. It is interesting to know what Professor W. J. Spillman, who is head of the Farm Management Department at Washington, says through the Farm Management Monthly that goes out from this office on this subject.

"Small farms devoted to general farming rarely, if ever, give an adequate living to the operator. In order to be profitable the small farm must be devoted to some intensive type of agriculture, such as truck, poultry, fruit, intensive dairying, etc. To be successful in any of these lines, the farmer must be an unusual man, on account of the complexity of the business not only in growing the crops and caring for the animals, but also in conducting the business side of the farm. Further, if the farm is devoted to perishable products there must be an important advantage in location with reference to markets. The production of perishable products far from market is attended not only with heavy freight and commission charges, but is subject to disastrous fluctuation in prices between the time of shipping the commodity and the time of its actual sale on the market.

"Intensive crops are normally subject to far greater fluctuations in price than are the staples. Taking the country as a whole, vegetables, including potatoes, occupy only 2¼ per cent of the crop area and fruit only 1¾ per cent. Under present conditions this is about all of these crops which can find a market at remunerative prices. On account of the small area involved it is very easy to increase production far beyond demand; in fact, this often happens, with results disastrous to specialized, intensive farming. The field for the profitable small farm is, therefore, a very limited one.

"The attempt to establish intensive types of farming in regions where markets are lacking, or on a scale inconsistent with market facilities, has led to serious mistakes. Such mistakes resulting from any great extension of truck growing soon become apparent and are soon corrected; but it takes longer to realize a mistake in fruit growing and therefore longer to correct it."

KEEP THE BOY ON THE FARM

Don't let the boy leave the farm. If he has a notion in his head to go to town, change his views by giving him some interest in the farm. How would you like to work, toil and labor for no return?

It may be that this son is the youngest of several sons. If so, he is at a disadvantage among his older brothers for when they were grown up they could work for some neighboring farmer and thereby get a small start in life, while the younger son was tending the home place. Now the youngest son has attained manhood and has nothing with which to start out on. Possibly he has to work out in spare time to secure a little spending money and probably his clothes. Now, brother farmer, are you treating him right? Must he leave the old home to get a start? Why not give him something to keep his interest up? For instance, give him a sow or cow, or a small share in the corn which he has labored hard in the boiling sun to produce.

I am sure that if you would do this your boy would stay on the farm and in doing so he will be away from the many snares and temptations of the city or town. Many farm boys get the wrong impression of farm life. They think that it is only through a life in town and a business career, that success can be attained, but in my estimation the man that has made a success as a farmer is the greatest success in the world. Let your son read good farm papers such as "The Missouri Farmer," and try to make farm life attractive for him if possible. Let him have a nice driving team and buggy, for it is the pride of a farm boy's heart to own a buggy and team.

Now brother farmer if your son is thinking of going to town, try some of these suggestions and I am sure you will never regret it.

Lue Benny.

MISSOURI FARMERS' EXCHANGE

The Missouri Farmers' Exchange is a state-wide organization of farmers, co-operating in the buying and selling of farm products. The ultimate object of the Exchange is to buy and sell farm products direct, and thus save freight, expense of writing to locate an article or market, get the article cheaper, nearer home, secure seed that is acclimated, and by each member signing an agreement assure one another of a "Square Deal."

The past season we corresponded with 2200 Missouri farmers, 7070 letters passing between the members and the secretary, to say nothing of how many passed between members. We bought and sold, by the office putting members in touch with each other, $24,944.83 worth of live stock, feed, and seeds. Out of the $15,231.67 worth of products our members report that they bought from other members, we saved $1,332.43 above what the articles could have been bought elsewhere. Some individual savings are as follows: H. J. Amidon, Vandalia, saved $35 on car of corn bought in Iowa; Miss Alice Kinney, New Franklin, saved $25.25 on seed oats sold; J. L. Smithson, Dexter, saved $39 on car of hay bought in Kansas; Geo. R. Renshaw, Branson, saved $8, on $21 worth of cowpeas bought. And this could be extended, but this is sufficient to show that one can make large savings over the local prices and even the general markets. In answering the question, "Are you pleased with the plan of service, and have you been dealt with unfairly," every member states, "I am pleased with the plan of service and have never been dealt with unfairly." This speaks for itself.

The plan is very simple. Every member sends the secretary a list of the articles they have for sale and want to purchase, and these are put on file. When each member receives an answer, he receives the addresses of all who have what he wants. He writes these and makes the trade direct, with no cost in the form of commissions. To illustrate, we shall take Mr. B. who lists a Hereford bull and a "want" for seed oats, and Mr. C. who writes that he wants a Hereford bull and has seed oats for sale. Mr. C. is sent the address of Mr. B. and two trades are effected. This often happens at the same station, and neither knew the other had what he wanted till they are put in touch by the secretary.

The cost of memebrship is one dollar ($1) as an annual fee to defray the expense of writing and advertising. There are no commissions charged, each member is allowed free trade, and profits by the amount of business he does. From our last year's report you will note that this is one organization from which you may expect to get your $1 threefold. The organization is one to which every progressive Missouri farmer should belong, and a year's trial will prove this to you. When you become a member, you do not commit yourself to trade with the members of the Exchange alone; you are permitted to trade elsewhere if you think it possible to do better.

WAITING FOR YOU

Yes, waiting for every farmer or farmer's son—any industrious American who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is higher but her farm land just as cheap and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads are Actually Free to Settlers and Other Land at From $15 to $20 per Acre

The people of European countries as well as the American continent must be fed—thus an even greater demand for Canadian Wheat will keep up the price. Any farmer who can buy land at $15.00 to $30.00 per acre—get a dollar for wheat and raise 20 to 45 bushels to the acre **is bound to make money**—that's what you can expect in Western Canada. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** is fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. Good schools, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for service in the war. Write for literature and particulars as to reduced railway rates to Superintendent Immigration, Ottawa, Canada, or to

Canadian Government Agent.

Farmers Must Co-operate

Dears Sirs: Enclosed find $1 for three years subscription to your paper, which is well worth the price asked for it and even more, as your articles on the co-operation of the farming classes are more than worth the price of the paper, and the day is not far distant when the farmer must get interested in this one subject or give up the farm. All other classes are now organized our merchants, doctors, colleges, and everybody but farmers. During the last summer I had a car load of wheat to sell and having business in St. Louis took a sample of the wheat with me and going into the Exchange there and visiting a half dozen buyers I met this proposition: "We cannot buy from the grower or producer, you must go back to Centralia and sell to your local buyer." Then, again, I wished to buy some oyster shell for our poultry and going to our local merchant, asking for prices and the answer 90c per cwt., but ordering from Chicago I received a better grade of shells for 39c per cwt. The time is almost here for "The Farmer's Union" and may the day hasten when we as farmers can stand united. C. E. Shock,
Centralia, Mo.

The money that has been sent out of the state to pay for hay fed during the recent dry years would have paid all expenses for seeding a million acres of alfalfa and with that much alfalfa well seeded the hay shortage would hardly have been felt. Better sow some alfalfa this year.

MISSOURI HOME MAKERS' CONFERENCE

This Department is Edited by Miss Alice Kinney, New Franklin, Mo.

THE HURRYING HOURS

How often the thought comes home to me,
As the moments hurry away,
Of the many things I intend to do
Somehow, some time, some day.
There are promises that have not been kept,
Though I always meant to be true,
But time is too short for all the things
That a body intends to do.

I will answer a letter or read a book,
I will write a bit of rhyme,
I will do the thing that I ought to do
Some day, when I have the time.
So I look beyond as I hope and plan
For the days that are just ahead,
While the day that is here goes into the grave
With its opportunities dead.

Today is the only day we have,
Of tomorrow we can't be sure;
To seize the chance as it comes along
Is the way to make it secure.
For every year seems a shorter year,
And this is a truth sublime;
A moment misspent is a jewel lost
From the treasury of Time.
—Selected.

WHAT A MARION COUNTY CLUB IS DOING

"The Rural Library Club was organized January 23, 1912, and its organization and success—in a large measure—is due to the untiring efforts of Mrs. A. C. Bross, who first conceived the idea of a neighborhood club, and was its president for three years. We have at present nineteen members and meet at the home of a member on the second Thursday afternoon of each month.

We exchange books and have a literary program, sometimes the entire program consists of clippings from the various household departments of the different magazines.

Again we have essays, reading, papers, recitations, written stories, contests and sometimes a few riddles, possibly a question box or maybe a game; always a business session and light refreshments are served with a pleasant social hour before we break up. During the winter we entertain the families and friends of the members at a party or an oyster supper at the home of a member; there is a big picnic for the summer with seventy or eighty people present, with a possible program. Besides all of these social times and the good books we buy—with the small membership fee and monthly dues—we have given two ice cream socials for the benefit of the Christian Orphan's Home at Council Bluffs, Iowa, and are planning something to have in the near future for them also.

Plays and box suppers help make entertainments at the school which proceeds are given to improvements for school equipment. Each month a visiting committee of two is appointed to visit the sick in the neighborhood.

We have about seventy good books now—and what is more helpful than to forget yourself and duties in some elevating book?

These things are helping us in our daily work—but we are not yet satisfield and the end is not in sight."

Mrs. W. S. Foster, Pres.,
Palmyra, Missouri..

We trust that this open Club Exchange is meeting with the approval of many of the rural clubs; it is interesting to note the many angles from which they view their special needs and make the necessary efforts to meet them.

The visiting committee to look after the sick—in the Rural Library Club—is fine; too often the rural invalid is a lonely "shut-in," whose long days would be cheered by a friendly visit.

Another suggestion: In every community there are a number of families who do not affilate with us in our social pleasures. Why not make a time or day when the hand of fellowship would be extended to them. We fully appreciate what this can mean to them and their vision of life.

The Vandalia Homemakers are setting the pace for the home and school to work in closer harmony. We wish that they would let us hear more of their good works, though so young in point of time and experience. The following record gives some of their effort which is meeting with success:

Rules Governing Credit for Home Work—Every Saturday afternoon a home work record slip will be given to each pupil. Beginning with Sunday all time spent by pupils in home work should be entered in the proper space. Each Tuesday morning a slip filled during the previous week should be returned to the teacher. The slip must be signed by the parents or guardian as an assurance that a correct record has been kept.

Any work not listed, but of value to the parents may be counted and the nature of the work specified in the blank spaces.

At the close of the school month, when the report of school work is made out, in the column of "home work," the pupil will be marked in the scale of 100 for actual work of not less than one-half hour each day, and in the column "personal care" on the scale of 100 for numbers A, B, C, and D and for attendance at church or Sunday School.

In addition to credit on the report card, reward may be given at the option of the principal for a specified amount of time spent in useful work at home.

For the purpose of reward, credit of 5 minutes a day will be allowed for each operation listed at A, B, C and D, and 20 minutes for attendance at church or Sunday school.

Home Work Record: Work in gardening, splitting kindling, bringing in fuel, milking cow, care of horses, preparing meals, washing dishes, sweeping, dusting, bedroom work, washing, ironing, care of baby.

Personal: Bathing brushing teeth, sleeping with open window, going to bed before 9 o'clock, attending church or Sunday school.

Fumigation of the Home and School.

"Formaldehyde gas is now commonly used in fumigation. It does not injure the texture of fabrics and very rarely changes their color. Formaldehyde destroys organisms by uniting chemically with the protoplasm. Formalin is a forty per cent or saturated solution of formaldehyde in water. Formaldehyde is usually sold as formalin.

"Methods of disinfection—Seal all crevices by means of cotton, rags, or by pasting strips of paper over all crevices; the furniture should be arranged so that as much surface as possible will be exposed.

"Place one-half pound of potassium permanganate in an earthen or wooden vessel and pour in one pint of formaldehyde liquid—full strength—(a large container should be used, since the effervescence will cause the liquid to run over the edge of the small container); many carpets and rugs are injured by this kind of carelessness. Leave the room at once, as the gas will be liberated immediately.

"This amount of potassium permanganate and formaldehyde should be used for every 1000 cubic feet of room space; leave the room closed from 12 to 24 hours.

"Many kinds of commercial disinfectants are used and these are not always reliable. The burning of small quantities of sulphur has very little, if any, value."

We hope the above formula sent out by the State Board of Agriculture will answer many requests that came last year for some practical method of fighting moths in the home as well as disinfecting; we have found that sulphur is a failure, even in a tight closet. One should not neglect to use the greatest caution in using the above formula.

If the potassium permanganate is placed in a paper bag it will take a little longer time to mix so that the person can be out of all danger before the gas is generated.

Now Is the Time to Swat the Fly.

Uncle Sam is waging a relentless war on the deadly house-fly and in a late bulletin prepared by the Department of Agriculture, valuable information is given on the best means of combating this deadly pest. The most effective way of exterminating the fly, according to the bulletin, is to eradicate his breeding places. The breeding season of the fly begins early in March and continues throughout the spring and summer months. All dirt should be removed from the premises, stables cleaned and decaying vegetables destroyed.

The fly has rightly been called the undertaker's traveling salesman, and in addition to his regular line of "typhoid bugs," he carries a side line of tuberculosis, Asiatic Cholera and other disease germs. Now is the time to "swat the fly."

Farming Tools

are *money savers*. High quality considered, the lowest price tools made. Last twice the "life" of common tools. Cost nothing for repairs and do better work after years of use than many other tools do when shining new from the Hardware Store.

Every hand farming tool on which you find the Keen Kutter trade mark is covered by a broad-gauge guarantee. If a Keen Kutter fork, hoe, rake, scythe, snath, shovel, axe or hay knife doesn't prove satisfactory, the dealer is authorized to return the money and take back the tool.

Send for our Garden Tool Booklet No. BI 1646.

Important Missouri Shorthorn Sale

By W. C. PREWITT & SONS, at CLARKSVILLE, MO.

THURSDAY, APRIL 22

22 HIGH CLASS BULLS AND HEIFERS 22

This sale offers an unusual opportunity for breeders and farmers of this state to secure Shorthorns of high quality from a herd that was founded along practical lines and has been at the front at most of the shows of this state for several years past.

This is our first public sale and we are putting in a class of cattle that we think are a distinct credit to us and the sort that will be money makers for buyers.

The offering is made up of 22 head of Scotch and Scotch Topped bulls and heifers.. They are a healthy, useful lot throughout and will be presented in excellent breeding condition.

With the feeding season over, and grass ready to turn on, NOW IS THE TIME TO BUY.

You are invited to come and look over the offering, and see them sell whether you care to buy or not. We will feel honored by your presence. Parties from a distance are to be our guests at the Huckstep's Hotel. The sale will be held under cover.

Write for catalog and kindly mention this paper.

Auctioneer: R. L. Harriman

PRACTICAL FARM PAPERS—No. 10

We set some peach trees this spring as it is our rule to set a few every two or three years, and we missed last year and year before. So I set twenty-two on April 6. Three years ago this spring we set fifty apple trees, 30x35 feet apart, and the peach trees were set between the young apple trees, the wide way of planting.

Although 1913 and 1914 were both very dry years we only lost two apple trees out of fifty planted. We also put out 750 strawberry plants in one of the spaces in the young orchard, and of the 750 five died. They bore us two splendid crops of berries, as they were well taken care of, but they will not bring many this year and we will set as many more next week. Any time during April will do to set young trees or berry plants, and I have set peach trees in May, all growing. While the peach is supposed to be short lived, we have had them to live and bear until thirty years old, but, of course, the trees were unsightly and gave small crops after they got old. My plan of growing peaches is to take the best of care of the trees until they are eight or ten years old then cut them away for younger trees.

A farm without fruit is no farm at all, and I must confess that we have been careless and let ourselves get pretty near out of an apple orchard, as we only have about fifteen bearing trees now, the old orchards, planted in 1854 and 1873 both being gone excepting for a few old trees.

On a neighbor's farm there are still standing four apple trees set in 1845, and they bear good crops yet. Father brought the trees from Dayton, Ohio, together with some for his father, and it took him two days to make the 60-mile trip, Dayton to Cincinnati, by canal boat.

We sent direct to responsible nurseries for our trees, and for many years have refused to buy of agents. In all that time our trees have come true to name—of course mistakes have been made—and have cost us about half agents prices, while every year we hear somebody cussing the agent who sold him his trees.

This April 7 is the first warm day this spring, frost having fallen every day in March, with no rain. Many people are through plowing, all well along, while at this date last year scarcely a furrow was turned. Much of the wheat looks bad and some will be plowed up. We will probably plow up eight acres of ours. Spring pig crop immense. Health of all No. 1.

C. D. Lyon,

FEEDING BLACKSTRAP MOLASSES

In reply to Earl Johnson in your March 15 issue, will say that we purchased our blackstrap molasses from the ..... It is guaranteed 42% Baume and it is our impression that this molasses will run around 60% sugar although there was no guarantee as to the amount of sugar it contained. It cost us 12c per gallon delivered at our station in carload lots which sounds a little cheaper to us than yours as we are in Northern Missouri while you are east of Kansas City and ours apparently is a very good quality.

We have a 52 gallon farm boiler and during the cold weather we mixed about 3 gallons of water to one of molasses and heated it thoroughly. In this way it mixes with the ensilage, cottonseed meal and corn meal to much better advantage than straight molasses or even the cold water and molasses and it is very little trouble to heat it.

We fed quite a batch of dry fodder run through the ensilage cutter in this manner last fall and the cattle ate it about as well as they did the ensilage. Otherwise it would have been almost a worthless feed. We are also feeding it to our hogs in a slop with corn meal and a little cottonseed meal but have not noticed any worms passing from the hogs after feeding it. We consider that you need either meat meal or cottonseed meal to balance the ration when fed to hogs. We are very enthuiastic about this molasses and consider we can make a much cheaper molasses feed than we can possibly buy, as I note by an experiment that is being conducted in Indiana now comparing straight molasses with Champion Molasses Feed that it is proving quite a little cheaper than the Champion Feed, which verifies our personal experience.

Will be pleased to hear further from you in regard to your experience at any time. Yours truly,

A. J. & P. Maurer,
Nodaway County.

An Important Shorthorn Sale

The attention of our readers is directed to the advertisement of W. C. Prewitt & Sons, Clarksville, Mo., in which they announce that on Thursday, April 22, they will hold their first public sale of Shorthorns.

This event should prove of more than passing interest to any of our readers who may be in the market for Shorthorns of quality, because it will afford an exceptional opportunity to secure well bred cattle, of the most approved type, at a time when the feeding season is almost over, and grass ready to be turned on.

Several years ago Messrs. Prewitt established their Walnut Valley herd by making very select purchases from some of the leading breeders of the country. Whenver new blood was added it was just as carefully selected as the original purchases. At the head of the herd stands the good bull Sultan's Heir 368468, a prize winner himself and a sire that has proven his ability to transmit to his offspring the qualities most sought after by buyers.

The offering consists of twenty-two head, including eleven good strong young bulls, and eleven females. Most of them are straight Scotch bred lots, a few however are Scotch Topped. Among the bulls cataloged are several youngsters that are promising herd bull prospects, and any one of the eleven will please the man looking for a bull to improve his herd. The cows and heifers listed represent some of the most fashionable breeding. They are the nice headed, wide, level backd, thick fleshed kind, with plenty of scale and quality.

Several times Messrs. Prewitt have been urged to hold a sale but they have prefered to wait until they could offer a class of cattle that they knew would not disappoint. They feel that the present offering is a very creditable one and extend an invitation to all who may be interested to be their guests on Thursday, April 22. The sale will be held in town and will be made regardless of inclement weather.

The catalogs are now ready and will be mailed for the asking. We recommend this sale to our readers and trust that they will show their appreciation of Messrs. Prewitts effort to produce Shorthorns of merit, by attending the sale. Kindly mention this paper.

Greiner's O. I. C. Bargains

Beginning with this issue F. J. Greiner, proprietor of the Maple Grove Stock Farm near Billings, Mo, calls attention of our readers to his herd of O. I. C. swine. Mr. Greiner has over 100 head of pigs on hand and is offering them at the following prices: choice of litter, either sex, $12, litter average, $10; September, October and November gilts, $15, bred gilts $20 and $25 each, bred sows $30 and $35 each. Mr. Greiner has been engaged in breeding a superior type of O. I. C.'s for a number of years and by careful buying, breeding and feeding and sending out only such animals as he could guarantee to please, he has established a highly satisfactory trade in something like ten or twenty states. He makes a practice of culling his herd very closely and any individuals that fall below the average are sold to the butcher. The pigs now offered are from mature sires and dams, many of which carry the blood of prize winners, and Mr. Greiner frankly states that they are the best lot of pigs he has ever raised. There never was a better time to buy pure bred stock than now. Mention this paper.

Maple Grove O. I. C's

Over 100 spring pigs from 2 to 3 months old at the following prices: Choice of litter, $12; litter average, $10; fall gilts, $15. Bred gilts $20 to $25. Bred sows, $30 to $35. Prize winning blood and the most popular strains. Each individual guaranteed to give satisfaction.

F. J. GREINER, BILLINGS, MO.

Johnson County White SEED CORN

The greatest drouth resistant and heaviest yielding variety of corn grown. My seed was from the originator's prize winning stock; cost me $10 a bushel, and what I offer was all in the crib before freezing weather.

Price extra select crated ears, $5 per bu. No. 1 Shelled Seed. $3 per bu. $5.50 per two bushel bag.

Only my own growing and selection. Better order early.

C. D. LYON, Georgetown, Ohio

Edgar Dooley Etterville, Mo.

LIVE STOCK NOTES

R. P. Royce, Fieldman

College of Agriculture Offers Duroc Boars

Elsewhere in this paper appears the advertisement of the Animal Husbandry Department of the College of Agriculture in which two choice Duroc boars are offered for sale at very reasonable prices.

One of the boars is a January yearling sired by Intrunder by Beauty's Success, the prize winning son of the champion, Beauty's Model Top. The dam of this boar is Top Best Girl by Orion Top Col. by the famous Top Col. The grand dam, on the sires side was the great sow Edna Browning, one of the best producing sows Sheley & Clatterbuck ever had in their herd. This young boar is really a very superior prospect for a valuable herd boar. He is an extremly lengthy fellow, very smooth, carrying excellent lines, has plenty of bone, and is extra good on his feet. He represents a genuine bargain and we feel sure that he will please most any one.

The second boar offered is an October yearling sired by the first prize aged boar at the recent Missouri State Fair, S & C's Valley Chief, and is out of a Beauty's Model Top dam. It will be noted from the above that this is the cross that has proven so successful in the Sheley & Clatterbuck herd. This boar leans a trifle more to the early maturing type than the first boar and for that reason will perhaps please some buyers more than the other. Any deficiency he may have in length is more than made up in extra width and depth and hams. A number of the best sows in the College herd are bred to him which is sufficient evidence that he is held in high regard by the Department.

The College had planned to keep these boars in the herd but find that they can be spared and are therefore offering them for sale. Either or both represent excellent values and we trust that our readers who can use a boar will not overlook this opportunity.

From time to time the College accumulates a surplus of breeding stock that is offered the buying public, and just now, besides the two boars referred to, they have on hand a number of good Duroc gilts that will be sold open or bred.

If interested in any of the above stock we would suggest that you write at once to Professor L. A. Weaver, Columbia, Mo. The advertisement will not appear again.

Lee Chief Goes to Kentucky

E. D. Moore, Columbia, Mo., has sold his sensational show mare, Lee Chief, to Pres. W. Ray of Bowling Green, Kentucky for $2500.

Lee Chief was shown nine times last year and won seven firsts, including the junior championship at the Missouri State Fair, and two seconds. She was regarded as the best mare out last year and horsemen are predicting a clean sweep for her this season.

Dean's Polands

Clarence Dean, Weston, Mo., is offering some rare bargains in Poland China bred gilts of strictly big type breeding. The gilts are sired by or bred to one or the other of Mr. Dean's splendid herd boars, Mastodon Price, by the famous old A. Wonder; Gritter's Longfellow 3rd; A. Wonder Price, and Jumbo Wonder. The dams of the gilts mentioned represent one of the grandest collection of broods sows owned in any herd in this state. Mr. Dean is also offering several tried sows that would look well in most any herd. The prices are extremely reasonable considering the quality and individuality offered. Mention this paper in writing.

Williamson's Poland Offering

H. S. Williamson, Centralia, Mo., who advertises Poland Chinas and Shorthorns in this paper, has a few strictly big type sows and gilts that are bred for April and May farrow that he is mighty anxious to sell. He also has twenty-one fall boars that will weigh from 125 to 175 pounds. The boars are just right for service. In speaking of these boars Mr. Williamson stated that they had extra length, heavy hams, good high backs, and the best bone and feet he ever saw on pigs of their age. He is pricing them from $15 to $25. Besides the above Mr. Williamson has forty-three open gilts, mates to the boars that are priced the same. Pairs, trios or more of unrelated pigs can be furnished.

In Shorthorns most anything from September calves to two year olds can be furnished. These bulls and heifers are of

CLYDESDALE HORSES FOR SALE

HALLECK BLAND, Rfd. No. 5 CENTRALIA, MO.

OAKWOOD POLAND CHINAS & SHORTHORNS

Bred sows and yearling gilts bred for last of April and May farrow. Twenty-one fall boars, big stretchy, big boned, heavy hamed, good backed fellows. Forty-three open fall gilts, extra good brood sow prospects. Several choice Shorthorn bulls and heifers. Satisfaction guaranteed or your money back.

H. S. WILLIAMSON - - Centralia, Missouri

SUPERIOR HERD BIG-TYPE POLANDS

We have at all times anything you want in strictly big-type Polands. Special prices on spring boars and gilts in pairs or more—not related. Write us your wants.

Freeman & Russ Kearney, Mo.

LOCKRIDGE'S GIANT POLAND CHINAS

In my recent sale gilts bred to my great young boar THE GIANT 72083 averaged $57. THE GIANT is conceded to be one of the greatest boars of the breed. You will want some of his blood. Booking orders for spring pigs. Write at once.

WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

POLAND CHINA BRED SOWS

DOUBLE IMMUNE

Two good yearling sows for May farrow. Have raised two litters. One fall yearling for first of June. Had one litter. Spring gilts for May farrow, weight about 300 pounds. These are the big broad-backed kind and prolific.

OBADIAH PRETTYMAN - - - - - Fairfax, Mo.

straight Scotch breeding, reds, whites and roans, good size, and the right type.

Mr. Williamson is one of the most successful breeders in the state and everything he sells is guaranteed to be just as represented or your money will be refunded.

Brockman's Good Durocs

Beginning with this issue A. C. Brockman, Route 2, Centralia, Mo., places his herd before the readers of The Missouri Farmer and asks that they consider his herd before making any purchases.

Mr. Brockman began breeding Durocs something over thirteen years ago, and from a modest beginning he has built up a herd that has enabled him to establish a trade over a very wide territory.

From the very first he has insisted on size, bone, prolificacy, and easy feeding quality, and the herd as it stands now is evidence that he has succeeded to a marked degree.

We have been more or less familiar with this herd for the past several years and each time we have seen it we were forced to remark on the exceptional lot of brood sows that were kept on the farm. We are not saying that Mr. Brockman has the best lot of sows in the state, but we do say that in point of uniformity, size, bone, and prolificacy few herds equal this one.

Many of our readers will perhaps recall the sow, Hazel Dawn, that Mr. Brockman exhibited at the recent Missouri State Fair. This sow was counted as the largest Duroc sow on the grounds. If we remember right she weighed 810 pounds.

Just now eight May gilts, bred to farrow next month, and seven May boars are in offer and owing to the fact that Mr. Brockman is crowded for room he is offering them well worth the money.

The above lot are sired by B's Col. Crimson by B. & C's Col. Perfection by the great B. & C's Col.

These boars and gilts are well grown out, have excellent bone, and are good colors.

Mr. Brockman would be pleased to hear from any of our readers who are interested and extends an invitation to them to visit his herd. Kindly mention this paper when you write.

Caldwell's Durocs

C. D. Caldwell, Milan, Mo., is advertising a nice lot of fall boars sired by his herd boar Leavell's Wonder, one of the good sons of Handsome Wonder. Mr. Caldwell has been breeding Durocs for about six years and has met with considerable success. He knows the kind that the average buyer wants and guarantees his stock to be as represented. We can recommend his herd to any of our readers who are looking for the useful kind at prices that are reasonable.

Rauscher's Chester Whites

H. Rauscher & Son, Kahoka, Mo., still have a number of extra good spring gilts bred to farrow in the next sixty days that they are making a special offer on. This is one of the good herds in Missouri when judged from any angle and the fact that it has been in existence for over thirty years is sufficient proof of the high quality of the Rauscher kind.

They also offer a cracking good lot of fall boars and gilts. This stuff is mostly of September and October farrow.

It will be to the interest of anyone about to buy to get into communication with Messrs. Rauscher. Mention this paper in writing.

Lawrence's Angus

V. E. Lawrence, Salisbury, Mo., writes under date of March 20, as follows: "My Angus have wintered well and are in nice growing condition. I now have about ten head of young bulls and heifers that I can offer the trade. The above stuff represents several of the leading families of the breed and at the prices I am asking should find ready sale. The past season has been a very trying one on cattlemen, but I take a very optimistic view of the future. I don't remember a time when a man could buy good cattle with greater assurance that they would make money than right now. I have always found that the time to buy is when prices are near the bottom."

There is a lot of truth in what Mr. Lawrence says and we urge any of our readers who are interestd in his kind of cattle, to write Mr. Lawrence at once.

Milking Shorthorns

W. P. Harned, the veteran Cooper County breeder advises us that he has on hand several very choice young bulls bred and selected along lines that are calculated to make them valuable additions to any herd that is being developed along milking lines. Mr. Harned has long been a persistent advocate of the milking Shorthorns and for years he bred with this idea in mind. He feels that the Double Mary strain he has developed equals in every way the famous Duchess blood, and he will be glad to give any of our readers more detailed information if they will but write him.

Mr. Harned has been identified with Shorthorns all his life and he is one of the best known and respected breeders in the state.

Lockridge's Giant Polands

Will G. Lockridge, Fayette, Mo., is now booking orders for spring pigs, either sex, sired by his great young boar, The Giant. This boar is easily one of the best big type Poland China boars in this or any other state and with the opportunity Mr. Lockridge intends to give him we are going to expect him to make a great record. The Giant is sired by Hercules 68356 and is out of Colossal Giantess by Old Colossal. The day he was nine months old he weighed 400 pounds, and measured 65 inches from between the eyes to the root of tail, was 61 inches in the heart girth, and stood on a 10½ bone. He is headed for the 1000 pound class and will reach that much talked of goal in about as smooth condition as one could ask in a hog of his size. Keep this boar in mind and ask Mr. Lockridge to save you a good boar or gilt sired by him.

Duroc Boars Express Prepaid

W. O. & B. A. Smith, Thompson, Mo., are offering the readers of this paper some attractive bargains in fall boars sired by their first prize senior yearling boar, Beauty's Model. Messrs. Smith are pricing these boars at $25 each delivered at your station. Remember that if you want the kind that win you must buy the blood of winners. How many prize winners can be recalled that did not have a lot of winning blood close behind them? None that we can think of. Here is an opportunity to secure proven blood at very moderate prices. Write them if you can use a boar.

Angus Bulls and Heifers

Readers of this paper will find it to their interest to write Robt. D. Turpin, Route 2, Carrollton, Mo., concerning the stock he is now offering for sale. Included in the lot is one aged bull, eight coming yearling bulls, that weigh from 700 to 800 pounds, and several extra good cows and heifers.

Weller's Durocs

J. E. Weller, Faucett, Mo., has one of the best known herds of Durocs in his section of the state and the young stuff he is offering in his advertisement should prove very attractive to any one planning to buy. We have visited the Weller herd and have no hesitancy in recommending his herd to our readers.

Spotted Polands

Edgar Dooley, Etterville, Mo., is advertising a nice lot of yearling and fall boars and gilts of the real old-fashioned big boned, spotted kind. We know men who have been made rich by handling this kind and if you want some of the genuine blood Mr. Dooley will be glad to talk "turkey" with you.

Angus Bulls and Heifers

J. M. Jones, Everton, Mo., calls attention, elsewhere in this paper, to a number of choice young Angus bulls and heifers that he is offering for sale, as well as his herd bull, Laddie Blackbird. Here is a chance to buy a bull of proven merit and Mr. Jones will be glad to have any one interested to visit his herd and look over the kind of calves that this bull sires. Mr. Jones is a thoroughly reliable breeder and we take pleasure in placing his herd before our readers.

THOMAS E. DEEM
AUCTIONEER
Selling pedigreed live stock is my specialty. Eight years of success in this line has proven that my customers are pleased.

JERSEY CATTLE
Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.
Wm. H. Bruns & Son, Concordia, Mo.

Jerseys-Spotted Polands
April Special—Jerseys: I will offer for April only, six young bulls, ready for service, at lower prices than I have quoted for six years. Also bred heifers.
April Special—Spotted Polands: For April only I am offering 35 fall boars, mostly October farrow, at $20 each. Order now. Also sow pigs and bred gilts for sale. Free circular.
THE ENNIS FARM, HORINE STATION, Mo. (Just south of Saint Louis)

Jersey Cows
I want to sell 20 head of registered cows and heifers that are either fresh or soon will be. Also four young bulls.
J. B. SMITH Platte City, Mo.

HOLSTEINS
Young bulls and heifers from A. R. O. cows. Sired by Sir Korndyke Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.
M. E. Moore & Co., Cameron, Mo.

Glenvarloch Large Yorkshires
The prolific, growthy and gentle bacon hog. Closing out entire herd at private sale. Bred sow, boars and pigs either sex. The produce of one Yorkshire sow will keep your family in delicious meat all next winter. Everything at bargain prices. All immune.
Frank Gildow, Mgr., Jamesport, Mo.

ELM LAWN HERD IMPROVED CHESTER WHITE SWINE Choice boars and gilts of September and October farrow for sale at reasonable prices. Everything recorded free.
W.B.Taylor and Sons,Weatherby, Mo.

RAUSCHER'S CHESTER WHITES!
One of the Oldest Herds in the West
A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.
Rauscher & Son, Kahoka, Mo.

Save $50 on your Silo
Don't buy or agree to buy any Silo of anybody till you get our latest Folder with special direct-from-factory prices.
We positively and absolutely guarantee to save you $50 to $100 in spot cash, depending upon the size you want.
You save $50 first because you pay no agent's or dealer's profit: second, because you buy from one of the biggest Lumber and Building Material Houses in America, and NINETY PER CENT of a Silo is LUMBER. The wood Silo is not an experiment, it has been tried out and found satisfactory.
Every Gordon-Van Tine Silo is genuine, Clear Oregon Fir, a wood that the U. S. Forest Service says is the strongest and longest lived. And we use one-piece Staves only—no spliced two piece staves to open up and ruin ensilage. It is the only stave that can be used any side, in or out.
Has New Adjustable Wall! All hoops are tightened from the ground. No guy wires needed!
No doors or door frames to weaken the structure, or warp and get out of shape, but instead is a real modern construction.
A Silo with framework as solid as Steel, none stronger. Built like a city "Skyscraper." Impossible to creep off of the foundation, is the easiest Silo on the market to erect.
The Gordon-Van Tine roof allows you to put more ensilage in our Silo than you can in any other Silo of a like diameter which is four feet higher. Sold under a written guarantee of satisfaction or money back. Prompt delivery guaranteed, no matter where you live. We make quick shipments of silos direct from Davenport. Send for complete, illustrated Folder showing many advantages. Then compare with other Silos you know. Remember we unqualifiedly GUARANTEE to save you FIFTY DOLLARS in real money.
Can you afford to choose a Silo till you have seen what a genuine bargain we have to offer?
If you write NOW, you will receive complete details by return mail.
GORDON-VAN TINE CO., 5704 Case St., Davenport, Ia.
Largest Factory-to-Farm Lumber and Building Material House in America.

STOP DISTEMPER AT THE START

DUROC BOARS
Extra good fall boars. Plenty of size and bone. Prices right.
C. D. CALDWELL, Milan, Mo.

BUCKSHOT BY THE PROFESSOR

If "greens" don't hurry up and grow I'll soon have to go to eating silage.

Even a mule loves kind treatment once in a while—and human beings still more so.

Suppose we buckle up the old belt a notch or two, spit on our hands and go in for a big crop this time? What do you say?

If you don't want your son to "chaw terbacker," drink "pizen," cus a blue streak, fight and raise Ned generally, suppose you cut these things out yourself?

There's nothing like getting up in the morning with a smile. It makes the day pass more quickly and happily—and it's hard on the doctor's business.

Lots of fellows don't think their wives are very pretty until some other fellow gets to "making eyes" at them. Then they raise a "holler" that you can hear for ten miles.

If old Saint Peter didn't use more judgment in picking angels than some farmers use in picking seed corn ther'd be a lot of horse thieves and train robbers in heaven.

You know, I like a home where Father or Mother returns thanks before each meal. Somehow I don't believe that a boy who comes from that kind of a home will ever go very far wrong.

I almost believe now I could have licked that fellow Johnson myself. I'd liked to have had a chance to have gone behind the barn and tried him a whirl—and I'd have done it for a bloomin' sight less than $20,000, too.

Upon the way and manner in which you plant things depends the harvest. You can't take a few "swipes" at a 40-acre field with an old rusty shoveled cultivator or a worn out plow and expect to impart a swelling to your bank account in the fall.

Is there a bright, ambitious farmer girl in your family? If so, will you not kindly have her send in her name to the Publisher of The Missouri Farmer? He has a mighty interesting offer to make to some bright farmer girl in every school district in the state.

Why not plant a few gorgeous roses this spring? Why should the people in the towns and cities be the only ones to enjoy beautiful flowers? Their sweet fragrance not only makes the farm home a more charming place to live in but it makes us better and kindlier men and women.

The Missouri Legislature had enough money to blow in $17,000 on junketing trips to "investigate" a lot of things nobody cares anything about—but it didn't have enough to appropriate a few hundred dollars for the State Board of Horticulture—and so it had to disband and give up the ghost.

It makes me "sore" to travel around over Missouri and see hundreds of farmers raking up and burning their corn stalks. Here we are trying to devise means by which we can maintain the fertility of the soil—and yet a lot of farmers are deliberately burning it up. So, too, we are sending millions of dollars out of the state for feed—and yet here are a lot of men who are burning up enough silage, had it been properly preserved, to have fed every horse and and cow in the state. Have we got much right to complain about "hard times" while we are guilty of such wanton waste?

Housekeeper Wanted

One of our good subscribers has appealed to us to find him a housekeeper. He recently lost his wife. Has several small children. Good wages and good home to right party. Address The Missouri Farmer.

TWO KINDS OF POTATO BUGS

A correspondent from Adair County, Mrs. Buelah Webber, says she has been bothered with the "possum" potato bugs and has not found any successful way to control them and would like to know how to get rid of them. The following advice is by Professor Leonard Haseman, Entomolgist of the University of Missouri:

The potato plant is attacked by two types of beetles which we commonly call the "Potato Beetle" or "Potato "Bug." The one common form in most localities is a hemispherical shaped object with yellow and black stripes. It is the so-called "Colorado Potato Beetle" and is the one which does most damage to the early potato. The other type of beetles is longer and more slender and may be striped with yellow and black or white and black or bluish. These beetles are the so-called "blister" beetles or the "old-fashioned" potato beetles. The one which you refer to is evidently this later type of beetle for when disturbed they drop to the ground and act "possum." The Colorado potato beetle may also feign death, though usually not so directly as the so-called "blister" beetles. The application of Paris green and London purple should quickly control the Colorado potato beetle, but the blister beetles are resistant to arsenicals, which is the killing element of the two poisons you mentioned, and as a consequence, one is not always able to destroy the blister beetles with arsenical poisons. The stock dip should have destroyed them if you touched them with it, unless, of course, you made the solution weak enough so as not to affect the bug. Stock dips are of no value in a campaign against this type of pest, however, for they are very destructive to the foliage of plants.

About the best way to control blister beetles is to resort to driving. With a little practice you can learn to drive them from your potato patch about as readily as you can drive sheep or other large animals. At first they act "possum" but a little dry road dust and a brush will start them to moving and they get over the ground quite readily once you get them started. It is a good plan to distribute a little straw along the edge of the patch and when driven into this, fire it and in that way destroy many of them. You can also drive them to the edge of the field with coal-oil or with very strong soap suds and a little coal-oil added in this way will destroy them.

It may be of interest to you to learn that the blister beetles in their grub stage are decidedly beneficial to the farmer, though the beetls in the mature stage are equally as destructive. The young grubs of some of the blister beetles live underground in the egg cases of the common grasshoppers where they feed on the eggs and in that way prevent many outbreaks of grasshoppers.

We want the name and address of every bright, ambitious country girl in Missouri. Write to The Missouri Farmer at once—for we have something which will interest you very keenly.

INCREASE YOUR PROFITS

By BUYING or HIRING a

RED RIVER SPECIAL

The farmer wants all of his grain saved. It can best be done by the *Red River Special.* It uses the correct principle to take the grain out of the straw—*It Beats it Out* with the Big Cylinder, the Man Behind the Gun and the Beating Shakers, just as you would do by hand with a pitchfork.

IT SAVES THE FARMER'S THRESH BILL

It pays the farmer to insist upon a Red River Special doing his threshing. It saves his grain and does not waste his time.

It is most profitable for the thresherman.

It threshes fastest—threshes most—threshes when conditions will not permit other kinds to work—and the farmers want it.

PRINCE ALBERT

the national joy smoke

Copyright 1915 by R. J. Reynolds Tobacco Co.

This is Charles Blow, of Dundee, Ill., who tips the age scales at 94 years. Mr. Blow is to-day, and always has been, a man who smoked his pipe liberally—and enjoyed it mightily. Mr. Blow qualifies for the Prince Albert "old-time jimmy-pipers club" and has just been elected to full-fledged membership. We would like to hear from other old-time smokers.

has this to say to you:

You get busy and smoke some pipe, or roll a makin's cigarette with Prince Albert tobacco that'll make you wish you could hark back to your first days of smoking.

Because, no matter how pipe-shy any man is, no matter how tender his tongue, *he can* smoke a pipe, and *he will* smoke a pipe if he smokes Prince Albert tobacco!

Why, smoking P. A. is like having breakfast in bed Sunday morning! You just pack that joy'us jimmy pipe with load after load. The first few puffs *prove* P. A. can't bite your tongue or parch your throat. That's because it is made by a patented process owned exclusively by the R. J. Reynolds Tobacco Co. *No other tobacco can be like Prince Albert.*

Prince Albert is sold everywhere. Just say, "P. A. for mine." In the toppy red bags, 5c; tidy red tins, 10c; pound and half-pound tin humidors; crystal-glass pound humidors.

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C

International Harvester Haying Machines

WHEN the time comes to turn your attention and your energies to the hay harvest for this year you will have to take the weather and the hay crop as you find them—but on you and your methods and machines will depend the amount and quality of the hay you get into barn and stack.

As to hay machines, many years of trying out in many fields have proved that you cannot do better than make your choice from the **International Harvester** lines.

International Harvester haying tools are carried in stock or sold by local dealers who can take care of you quickly in case of accident. It is their business to see that you are satisfied with the **International Harvester** haying machines and tools you buy from them. You cannot go wrong if you buy only haying tools with the I H C trademark.

Write us, and we will give you the name of the nearest dealer handling **International Harvester** haying tools, and we will send you catalogues on the machines in which you may be interested.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Let Us Save the Farm Waste

Competition compels every manufacturer to watch closely to save the waste or by-products of his plant from the sale of which he reduces the cost of his wares and materially adds to his profit. But careless methods and following in a rut have caused a loss to farmers that would have bankrupted any other business. There are many leaks on the farm which cause material loss but the greatest waste is the failure to save the corn fodder and utilize it for increasing the profits of growing live stock.

Annually Missouri farmers cultivate one-sixth the whole area of the state in corn. Last year—a drouth year—we produced on 7,421,678 acres a total yield of 175,158,072 bushels of corn valued on the farm at $115,257,869 for the grain alone. This was more than fifty per cent of the value of all our farm crops. The experiment stations have found and their findings have been proved by thousands of farmers that the forage of the corn crop when utilized by making it into silage is equal in feeding value to two-thirds that of the grain. Upon that basis the value of last year's corn fodder if made into silage would have been worth $76,871,912. Not more than one-half the fodder is saved under present methods and hence the farmers' loss for one year only amounted to $38,435,956.

Last year's loss on our corn fodder could it have been put into the silo would have paid for building more than 12,000 miles of gravel roads at $3,000 a mile. The loss would have paid for building a first class high school at a cost of $10,000 each, within easy walking distance of every farm boy and girl in Missouri. This wasted fodder made into sweet silage and fed to dairy cows would have paid the flour bill for every farm family in the state and then there would have been enough left to have paid the shoe bills and more.

Fifty years ago most farmers were cultivating a virgin soil and a crop could be grown with very little effort and in spite of adverse seasons of drouth or wet weather. Today we cultivate a depleted soil, the cost of labor has increased, the price of the land has gone skyward, insect pests have multiplied and the only way to make the corn crop pay its share of farm expenses and profits is to save the fodder by putting it into the silo.

The silo has become a positive necessity on every modern, well regulated farm where live stock is kept. The dairy farmer finds the silo essential to success in winter and almost equally valuable in time of short pastures in a summer drouth. The breeder of purebred stock finds silage a most valuable feed in the growing and development of breeding animals. The feeder of beef cattle finds that a ration of corn silage supplemented with cottonseed meal and clover or alfalfa hay will greatly lessen his cost of making beef. The man who keeps horses or mules, sheep or hogs, poultry or any other class of animals will find profitable use for silage made from many crops which are not now otherwise used to good advantage. The cost of a silo will prove a good investment on most farms and a means of saving the greatest of all farm wastes.

A Hollow Tile Silo on farm of Marshall Gordon, president Missouri State Dairy Association, Boone County, Missouri. (See page 13)

GEO. B. ELLIS
MANAGING EDITOR

VOL. VII MAY 1, 1915 NO. 9

WILLIAM HIRTH
PUBLISHER

ASHES AND HEN MANURE

Unleached hardwood ashes should contain about 5 or 6 per cent of potash with one per cent of phosphoric acid. But potash seldom produces its full effect unless used in connection with more phosphorous than is contained in ashes, and therefore ashes should be mixed with some such carrier of phosphorus as acid phosphate or steamed bonemeal. 250 pounds of unleached ashes and 180 pounds of 16 per cent acid phosphate would carry as many pounds of phosphoric acid and potash as would be found in 300 pounds of a 10-4 fertilizer.

Ashes are about one-third lime, and the addition of lime to acid phosphate causes the reversion of part of the phosphorus from the water-soluble to the citrate-soluble form, but this is no longer considered a serious matter. There is usually sufficient lime in the soil to cause this reversion, and if there is not, there should be, because this quantity of lime is essential to full crop production. For example: at the Ohio Experiment Station 320 pounds of acid phosphate has increased the value of crops by $15.20 on unlimed land, and by $24.20 on limed land, over and above the cost of the acid phosphate and the lime, as a 10-year average.

A ton of fresh hen manure should contain about 22 pounds of nitrogen, 20 pounds of phosphoric acid and 10 pounds of potash as a general average. When air-dry, hen manure should contain about 40 pounds of nitrogen, 40 pounds of phosphoric acid and 20 pounds of potash in the ton. Fresh manure from fattening cattle should contain 15 pounds of nitrogen, 8 pounds of phosphoric acid and 10 pounds of potash per ton, while as a general average, mixed barnyard manure, after exposure to the weather in open yards, is estimated to contain 10 pounds of nitrogen, 6 pounds phosphoric acid and 10 pounds potash to the ton. A ton of dry hen manure is therefore worth approximately as much as four tons of average yard manure.

Many persons propose to mix ashes with hen manure, but no material containing lime, in the form in which it is contained in ashes, should be mixed with moist manure, as the lime will cause the liberation of a considerable part of the nitrogen in the manure, and it will escape as ammonia gas. Ashes and dry hen manure may be mixed immediately before applying the manure, as the ammonia will mostly be absorbed and held by the soil.

The proper material to mix with manure is acid phosphate, as this serves to fix the ammonia, instead of liberating it and also re-enforces the manure with phosphorus, which is the element most needed by most Ohio soils.

At the Experiment Station, and as a 16-year average, 8 tons of fresh cattle manure has produced increase of crop to the value of $26, the manure being applied to corn in a 3-year rotation of corn, wheat and clover. When the same quantity of manure has been reenforced with 320 pounds of acid phosphate—40 pounds per ton of manure—the net value of increase, after deducting the cost of the phosphate, has been $39.

Acid phosphate, sprinkled over the dropping boards, will reduce the loss of ammonia and increase the effectiveness of the manure.

A mixture of 250 pounds dry hen manure, 150 pounds acid phosphate and 100 pounds unleached hardwood ashes will contain practically the same quantities of ammonia, phosphoric acid and potash as would be carried in 300 pounds of a 2-10-2 fertilizer.

By using a sand sieve and a wooden pestle to pulverize the manure such a mixture may be applied with the ordinary fertilizer drill, and if the ashes are not added until within a few days of the application there will be no appreciable loss of ammonia.

Coal ashes have practically no fertilizing value, but may sometimes be used with advantage in loosening a compact clay soil, or as a mulch around small fruits in the garden.—Press Bulletin Ohio Experiment Station.

POOR THRESHING COSTS DOUBLE

It wastes the farmer's grain by throwing too much into the straw stack.

It wastes the time of both farmer and thresherman by bother, breakdowns, etc.

It loses the thresherman the best jobs and the best of his run.

THE RED RIVER SPECIAL WILL SAVE ALL THIS LOSS

The farmer should insist on the RED RIVER SPECIAL doing his threshing. He has a right and it is his duty to do this. It is his grain that he has worked hard to plant and harvest and the loss falls upon him.

The RED RIVER SPECIAL employs the only correct principle for separation. It uses force to get the grain out of the straw. *It Beats it Out!*

It Saves the Farmer's Thresh Bill

C. L. Erickson and ten other farmers of Paswegia, Saskatchewan, say: "We want the Red River Special outfit to do our threshing next year as it saves all of our grain."

The shrewd thresherman should equip himself with the outfit that is popular with the farmers and that makes him more money by doing better work and more work.

Provide yourself with the Red River Special outfit and

NO WAR TAX on HOMESTEAD LAND in CANADA

The report that a war tax is to be placed on Homstead lands in Western Canada having been given considerable circulation in the States, this is to advise all enquirers that no such tax has been placed, and there is no intention to place a war tax of any nature on such lands.

(Signed) W. D. SCOTT,
Supt. of Immigration.

SUCCESS WITH ALFALFA

About a year ago, in connection with other parties, I purchased two sections of land in the famous Missouri River bottom, lying south of Carrollton, every acre of which is in a high state of cultivation. We planned immediately to get forty acres on every one hundred sixty of this land, seeded to alfalfa. We began last spring to seed a number of acres to oats and alfalfa, and on every piece that we seeded with oats, we cut a good crop of oats and two crops of alfalfa, last year. We continued to seed as we had the opportunity, as late as the tenth of October, and on no piece did we fail to get a good stand of alfalfa, but I am somewhat uneasy about some of this alfalfa, and wish your advice on the matter.

On some fields of alfalfa, the roots are thoroughly alive with nodules, showing a great abundance, while on other fields where the soil is apparently the same, I can not find any at all. I have tested the soil from a number of these fields and find that all contain, apparently, plenty of lime, and I can not find any reason why there are no nodules on some of this alfalfa. None of this land was inoculated before seeding; neither did we inoculate any of the seed. The alfalfa which is thoroughly alive with nodules does not appear to be any healthier, or does not seem to be making any better growth, than that on which there are no nodules.

Can you tell me what will be the outcome of this alfalfa, on which there are no nodules, and in your judgment will it continue to live and grow? Could I do any thing for it, or would inoculation do any good after the alfalfa is six months to a year old? We have improvements on every one hundred sixty of this land, and it is our purpose to divide it, and sell it in tracts to suit the purchaser, and for this reason we would not stand back on any reasonable expense, in order to help this alfalfa.

I wish to say that I am a regular reader of The Missouri Farmer, and like the paper very much, and am glad to say that I have been able to get more than its cost out of any one of its issues. E. H. Quisenberry, Carroll County.

Where there is plenty of available nitrogen the alfalfa may not show the nodules because they are not needed. This condition is most likely to occur on the rich bottom lands like you describe. If the land is the same I do not see why there should be any difference but the difference may be in the way the land has previously been handled.

So long as the alfalfa shows a good dark green color and grows well you need not worry about it. You can inoculate, however, if it shows a need of it later, by scattering inoculated soil over the field and disking it in immediately. Go to the field where plenty of nodules are found on the alfalfa roots and dig up from the top 7 or 8 inches of soil enough to spread 200 to 300 pounds per acre over the field needing inoculation. It is better to do this on a cloudy day as the sunlight will soon kill the bacteria if it comes in direct contact with them. You had better do this just after the first or second cutting and then follow up the sowing with the disk so as to work the inoculated soil into the ground. If there are any weeds starting this disking will help to get rid of them. However, I would not worry about inoculation so long as the alfalfa was growing all right and showing the dark green color.—The Editor.

Neighborizing the Farmer

One of the most significant facts of our telephone progress is that one-fourth of the 9,000,000 telephones in the Bell System are rural.

In the days when the telephone was merely a "city convenience," the farms of the country were so many separated units, far removed from the centers of population, and isolated by distance and lack of facilities for communication.

But, as the telephone reached out beyond cities and towns, it completely transformed farm life. It created new rural neighborhoods here, there and everywhere.

Stretching to the farthest corners of the states, it brought the remotest villages and isolated places into direct contact with the larger communities.

Today, the American farmer enjoys the same facilities for instant, direct communication as the city dweller. Though distances between farms are reckoned in miles as the crow flies, the telephone brings every one as close as next door. Though it be half a day's journey to the village, the farmer is but a telephone call away.

Aside from its neighborhood value, the telephone keeps the farmer in touch with the city and abreast of the times.

The Bell System has always recognized rural telephone development as an essential factor of Universal Service. It has co-operated with the farmer to achieve this aim.

The result is that the Bell System reaches more places than there are post offices and includes as many rural telephones as there are telephones of all kinds in Great Britain, France and Germany combined.

Team Work for Betterment of Agriculture in Missouri

By Geo. B. Ellis, Managing Editor

Any boy who ever drew the reins knows the value of team work in the use of animals for farm power. He knows how important it is in mating his work teams to select those individuals for the make-up of a team, whether it be a team of two, three or more animals which by gait, endurance, strength and disposition are not only equally matched but which have been trained to work together. The larger the team, that is the greater the number of individual animals in the team, the greater the importance of every animal fitting into his niche and doing his full part of the pulling. With a team of four, six or eight horses it is really necessary to have a big and strong pair for the "wheelers"—a pair that will throw their full power against the collar and hold until the lighter leaders swing into line and the combined power of the whole team moves the load. How often have we seen the "leaders" too quick for the "wheelers" try their strength at the load and fail because they did not "hang" until the sturdy old team put their weight into the collar.

All Must Pull Together

Missouri agriculture offers great possibilities for effective team work. We have a lot of individual strength for good in agricultural betterment but the individual can move but a small load as compared with the united effort of the whole team. What we need now to put Missouri in the very fore front of agricultural progress is for everybody from the individual farmer, the local farmers' club and the grange on up to our college of agriculture, the board of agriculture and other state wide organizations to find their right place in this great agricultural team and then all pull together for whatever will make this a better state.

Nature has done much for Missouri, but she has left a plenty for men to do if we would have her lead in social, moral and intellectual progress. It ought to be the pride and ambition of every true and loyal Missourian to make the state as a whole stand for the very best there is in American citizenship and American homes. If this is ever done it will not be through individual effort alone but it will be when our forces are all united in one powerful team, working as one man, for one purpose, and for the good of all. It will be when we make the spirit of co-operation and team work the true Missouri spirit. This will require not only loyalty to state, and it matters not whether we are native or adopted sons, but it will demand of us enthusiastic support of every state institution together with an abiding faith in the future greatness of Missouri. The man who does not believe that Missouri possesses both in the quality of her citizenship and in her potential resources the raw material necessary to make this state the equal of the most advanced state in the Union will not be of any great benefit in the team work for the betterment of Missouri agriculture.

Must Be Loyal to Our State

The man who lives in Missouri and permits himself to believe that Nature has done more for other states or that there are better opportunities elsewhere will not fit into this team work to good advantage. He will lack the enthusiastic loyalty and unlimited faith that it takes to make a good team worker. The man who allows himself to think that the institutions of other states are superior to Missouri's institutions may not be expected to urge greater support to make our own better. The man who will send his son or daughter to the University or College of another state because of some slight or possibly only imaginary superiority is not putting any weight against the collar to make Missouri institutions of learning better than those of other states.

This team work for the betterment of Missouri agriculture should begin at home, right on the individual farm but it must not end there. The man who is doing good team work on his farm is the one who gathers from his agricultural papers, from bulletins, from books, from the farmers' institute, the grange or the farmers' club all the help he can get and then without prejudice—with a mind open to all the knowledge he can get proceeds to work out his problems on his own farm. But that is only the beginning of good team work—it is not all of it. We might say it is not team work at all but it is only the training necessary to fit a man for doing team work to accomplish the bigger things which need to be done. Small things only are done by individuals, great things require the united work of many.

What are the agencies which go to make up the team work for agricultural betterment in Missouri? At the head of the list should be placed the agricultural college, an institution whose leadership we should all willingly follow. It matters not that our agricultural college may sometimes make mistakes—it has made many mistakes—but with all that the progress in farm betterment would have been fifty per cent further along had we farmers accepted the leadership of the college with the mistakes thrown in. I am not arguing now that we should accept a fallacy or an impractical rule of farming but what I mean to say is that there has been so much more of good than bad in what has been taught by our college of agriculture that we would be ahead in the game if we were to take it all—the bad with the good.

The Agricultural College Should Be in Sympathy with Farmers

But while we are urging the individual farmers to accept the leadership of the agricultural college we are not trying to excuse the college for any mistakes it may make or may have made, for we think that institution should be held strictly to account for its responsibility of leadership. One reason the college of agriculture fails to do its best team work along with the other forces engaged is its lack of enthusiasm. We think as a rule agricultural colleges and the teachers therein are entirely too conservative—too much afraid of their ground. One reason for this is a lack of sympathy for the every-day affairs of the farmer's life and the lack of contact with farmers. If college professors were required to do a few weeks practical farm work every year—even though at the expense of that European trip so much desired—they would have a better appreciation of the thousand difficulties under which farmers are working. The agricultural teacher is too apt to become an idealist, as many of them are, overlooking the hard fact that on ninety-nine farms out of every hundred there are a thousand things to do, some of them really impossible, before conditions will fit the ideal. Whether we place the agricultural college at the wheel expecting the institution, through its great organization of teachers, investigators and extension directors, to move the great weight of the load; or whether we shall put it in the lead to direct the farmers so they can do most of the pulling themselves; we repeat that in whichever part of the team the college of agriculture finds its place, it must get in closer touch with actual farm conditions before the best work can be accomplished.

While we think enthusiasm for the farmer's betterment and sympathy with his life and understanding of his difficulties and hardships are all necessary before the college professor can fit into his place properly, we are convinced that it is of very much greater importance that farmers should cultivate a sympathy and confidence in their work, one for the other. In the great conflict of the nations across the globe the one thing that makes it possible to continue that inhuman struggle is the universal sympathy every man has for his fellows and the consciousness each individual has that he is fighting, not for himself alone but that he is fighting for his country. Team work in this great fight which is going on here and elsewhere for the betterment of agricultural conditions is only the new way of fighting the world-old battle of knowledge against ignorance. Just as we have learned, step by step, that the scythe and cradle were better implements than the reap hook and the reaper was a great improvement over the scythe and cradle and the self-binder and complete harvester were vastly better than the old-time reaper, so we must learn step by step that to work together we can accomplish more for ourselves and for the good of all than to keep on in the old time way of individual effort.

The Indian let his ponies browse the brush or graze the prairie and compelled his wife to laboriously plant the corn with a blunt stick. The Indian did not know the value of team work and his race has been almost wiped off the face of the earth and the white man has taken his place.

The Future of Missouri Is in Our Hands

Team work simply defined means efficiency—a better way of doing the same things we have been doing and of doing things impossible under individual methods. We have been doing some team work for a long time in Missouri but we ought to do more. The old-time subscription school might be said to have been the first step in team work in education. Before that each family hired its own teacher. It required some sacrifice of opinion and compromise of differences to get together and all use one teacher. But what would we think of the old subscription school today? Team work has given us our present public school system not only free to every child in the state but every child not otherwise provided for compelled to attend. With the graded elementary school, the high school, the state normal school and the state university all free to any child who will attend, we have made a big step from the old family method of teaching the children and really with thousands of them not taught, and all this the result of team work in education.

Whether in the future Missouri shall be called a great state; whether we as a people will be known as enlightened, progressive and successful in business; whether or not we shall hold our own with other states in the rapid strides of the world's development; it will all depend upon whether or not we can bring together in one powerful harmonious working body the college of agriculture, the board of agriculture, the state farmers' organizations, the local farmers' clubs and the individual farmers. Team work means united work, it means sacrifice of personal opinions at times but compensation will come in the general agricultural betterment and each individual will get a greater share than if he were working independent and alone.

JOHN IMPROVES THE FARM

John D. Lawnsdale inherited the old homestead two years ago. He had worked hard to build it up, and had determined to place the farm on a permanent and paying basis. With this in mind he had applied fertilizer and energy in increasing amounts.

He was coming home from town one day with a load of concrete fence posts and met his neighbor George Martin, who said,

"Hello, John, what are you going to do with all those concrete fence posts?"

"I am going to repair that old fence line next to my west cornfield near the creek pasture. The cattle gave me so much trouble there last summer that I decided I would not fool with them any longer. Those old wooden posts have all rotted off and I decided to replace them with something that would last."

"They must have cost you a lot of money, didn't they?"

"No. They did not cost me so very much. I only paid thirty cents apiece for these and the Citizen Lumber Co. is asking twenty-five cents apiece for good cedar posts. I think these are well worth five cents more because I don't think I will have to replace them as long as I live here. I put in a few

A pleasing entrance to the farm.

last year and I liked them so well that I am going to put in about eight hundred this spring and about one thousand next year. Do you know that old pasture lot where that old rail fence used to be?"

"Yes."

"Well, I cut that old rail fence up and made stove wood of it. It certainly made good fire wood and made lots of good wood for Mary to cook with. I think that the old hedge fence and rail fences are relics of the past. We should no longer tolerate these inefficient forms of fencing.

"Why, when I tore that old rail fence down, I found that it was nothing but a harbor for weeds, mice and other pests. I burned the brush and killed about a million insects and chinch bugs that were wintering there. Concrete fence posts for mine. I can now burn the weeds along the fence every season and thus get rid of a lot of pests and weed seed. The concrete post will not burn and it is pretty easy way to clear the farm of weeds.

"Wood posts do not last long and good posts are hard to get now. While well made concrete posts are practically indestructible and also possess many other advantages."

"Those posts do not look like they would be strong enough."

"Oh yes they are, they will stand all the strain an ordinary fence will get. They are reinforced with No. 3 steel rods placed in each corner of the posts about three-fourths of an inch from the outside so that they will be well covered. All concrete posts should be well reinforced. I have known of some people using old rusty barb wire fence. But this does not make good reinforcement. The purpose of reinforcing is to add strength to the post. Old rusty wire and scrap iron, which in itself has become weakened by rust and corrosion can not add strength to the concrete. The most desirable reinforcing is the round, square or twisted square rod."

"I wish I had some of those but I haven't got the money to buy them."

"Well, George,I tell you what I am going to do after this. I am going to make my own posts. Bill Jones over on Providence Road made his own posts and they only cost him seventeen cents apiece not counting the labor he put in on them and he had to pay $1.10 per cubic yard for his sand and gravel, 3c a pound for his reinforcement and 40c per sack for his cement. Now, I am going to use the sand and gravel from the old creek bed in the pasture. It is just right to make good concrete. Then all I will have to buy will be the reinforcing and cement. That will make the posts cheaper than good wood posts."

"How do you make them? Are they hard to make?

"No, they are not hard to make and any one who is handy with tools can make a set of post molds in a short time, or he can buy them already made."

"What mixture do you use?"

"You can use a mixture of 1-3—one part of cement to three parts sand, or if you screen and grade the sand and gravel, which is better, you can use a mixture of 1-2-4 using no larger aggregate than will pass through a half inch mesh sieve. For gate posts and corner posts larger sized gravel can be used.

"There are two methods of making concrete posts, namely: the wet and the dry methods. In the first method, the concrete is mixed rather dry and tamped in the molds. The molds are then removed and the posts allowed to cure. In the curing of the cement posts they are kept damp until they are thoroughly set. This is done by sprinkling them with water and covering them with wet straw or sand."

"How do you fasten the wire to the posts?"

"There are a great many different ways. Sometimes holes are made through the posts by placing small pins or greased bolts in the forms. These are removed before the concrete has set, leaving a hole through which a short wire may be placed to fasten the line wire. This method is more or less unsatisfactory. There are also several patent fasteners on the market, but their use increases the cost of the posts. Usually the cheapest and simplest way is to fasten the wire to the post by wrapping a small wire around the posts."

"By the way, here is a picture of my new gate posts I put in this spring. Mary's cousin was out from town last Sunday and she took a picture of the place. She gave me this one when I was in town today. I haven't the gate put up, but will have soon. The gate won't sag on these posts."

"Well, John, you certainly have made a great improvement on that old place since your father died. If he were to come back, he would not know the place. It certainly looks good. So long, John. I am coming over to see you soon and learn some more about these concrete posts."

"All right. Good-by George. Come over and bring your wife along. Mary will be glad to see her. If I were you, George, I would write to the Agricultural Experiment Station at Columbia, Mo., and the various cement companies and ask them for their literature on making concrete fence posts. These free bulletins which they send out certainly contain a lot of valuable information." M. A. R. Kelley,
Instructor in Agricultural Engineering

HOW TO INTEREST THE BOYS AND GIRLS

Last year the Farm Bureau organized some Tomato Clubs where the girls were to grow and can a tenth acre. Where local leaders were obtained success resulted regardless of a very poor season.

A club conducted by Mrs. Irb Miller of Pittsville and Mrs. J. E. Deal of Holden was especially successful. Mrs. Miller started with only seven girls and four of those became discouraged by dry weather and army worms and dropped out. Now she has twenty girls wanting her to be their leader this year. It was a member of this club, Mary Turnbow, who won the State Trophy offered at Columbia. What is more this little girl, twelve years old, sold $50 worth of tomatoes from her tenth acre and will use this money to attend High School.

The Story of Mary Turnbow

Mary, as the accompanying picture shows, is rather small for her age. She lives in the village of Pittsville and had no land available. A neighbor who lives a mile away let her have a piece of land. Each day she walked back and forth to her garden and cared for her plants. In July a Home Economics school was conducted in the neighborhood and she attended this so as to learn how to can her tomatoes. When the tomatoes began to ripen not only must these long trips be made every day but fruit must be picked and carried home. Sometimes, but not always, she had the use of the family horse for this work. The season was far from good but she put up about 300 No. 3 cans and sold enough fresh tomatoes to bring her income to $50. Think of it, $500 income per acre and by a little girl, too. The following is her own story of the work:

The girls of this community met this spring and organized a club which we called, "The Girls' Agricultural Club." There were fifteen members and they were all willing to help make our club a success. Our club did a great deal of good work in this community and it is also helping children

Mary Turnbow, 12 years old made $50 from one-tenth acre of tomatoes.

of other communities to organize such clubs as ours.

These clubs make us feel like we had rather stay on the farm than go to the city, and this is what we are all working for. We had such good success with our Agricultural Club we organized a Sewing Club to last through the winter.

Transplanting: First the ground was plowed, harrowed, then worked over with hoe and leveled down. I next made my rows three feet apart, set my plants three feet apart. Before I set them out I put a small quantity of chicken manure on each of the hills. Then I set the plants deep enough so the dirt came almost up to the first leaves.

When I had them all set out the rows were checked. The tomatoes were "Early June" and "Ponderosa." (Stone variety would have been better, C. M. L.) To set them out it took me two hours. The plants cost 25c.

Watering: Every evening about sundown I put a cupful of water on each plant. This took me twenty minutes.

Cultivating: I first hoed all the dirt loose around the plants then while the plants were young and tender I kept the dirt around them so the sun would not sunburn them. This took me two hours.

Nell Shelton, member Industrious Roberts club, won state prize for first essay.

Delta Deal Makes $40.

Another successful club member is Delta Deal. Her income exceeded $40 from a tenth acre. She was a member of the "Industrious Roberts Club." Not only did she can tomatoes but she put up a fine display of all kinds of fruit and vegetables in glass. This display won her several dollars in prizes in the township and county exhibits, and her club work won her a free trip to Farmers' Week at Columbia. She also won a trip to the State Fair at Sedalia, owing to her proficiency in canning. Here her work was admired by many people throughout the state.

Miss Nell Shelton Wins State Prize

We show herewith the picture of Nell Shelton, another member of the Industrious Roberts Club. Nell won the state prize offered at Columbia for the best essay on "Canning Tomatoes" accompanied by a can of tomatoes. She also won a trip to the State Fair last fall where she and Delta Deal and Ethel Kaiser, another Roberts Club girl, put on a demonstration in canning under the cold pack process.

Floy McWethy, another Roberts Club girl, got an income of about $40 from her tenth acre. Mary Brown of Post Oak, sold $30 worth to her neighbors

but canned none, except for home use.

Not only have these girls made some money but what is far more important they have learned how to preserve fruit and vegetables in an easy, cheap and wholesome manner for home use.

C. M. Long.

WHAT TEAM WORK IS DOING IN JOHNSON COUNTY

What a fine thing it would be if we had the money in the bank to our credit that would represent the loss we have sustained from hog cholera during the past five years. Yes, the amount covering the loss for one year would look pretty good in these times of high priced feed and slim bank accounts. And just to think we could save practically every dollar of this waste if we farmers could divest our minds of our little prejudices and jealousies and preconceived notions of our own and just do a little team work by counties like the farmers of Johnson County have been doing for about a year under the leadership of C. M. Long, county farm agent, in a fight to rid their county of hog cholera.

Map No. 1 on this page will give you some idea of what the proposition was when Mr. Long under the able direction of Dr. Connaway and assisted by Mr. M. I. Hurley, organized more than twenty teams explicitly anti-hog cholera clubs and began the fight to control cholera in Johnson County. This map shows the condition before the hog cholera control work began. From a careful census of the county Mr. Long ascertained that the loss from hog cholera in Johnson County for three years previous to the time of this clean-up work amounted to approximately $116 per farm on the average or a total loss for three years of nearly $450,000. Now turn to Map No. 2 and observe the cholera infected farms found in the nearly six months, Oct 1, 1914, to March 21, 1915. It will be observed from the legend under the map that about half of the farms indicated were not infected farms but on these farms the hogs were merely treated with serum as a means of protection. According to the reports the losses have been reduced from an average per farm of $116 to $6.25 per farm; quite a nice sum saved to the farmers of that county.

A look at this Map No. 2 shows that nearly all the infected farms for the last six months have been in the northern part of the county. Across the line in the adjoining county to the north there is no organized work for the control of hog cholera. In this territory it is reported that a great many farmers use the simultaneous method and that there has been a great deal of cholera in that territory. This shows very clearly what it would be worth to have the entire state all under close organization and strict supervision so that sanitary measures could be enforced. With the kind of work they have done in Johnson County extending to every county hog cholera could be put under control and practically exterminated inside of two years.

Another line where team work is showing up to great advantage for the farmers is the campaign started by Mr. Long to get the farmers to plant soybeans this year as a protection against possible loss from chinch bugs. One farmer expresses the idea pretty clearly when he says, "If we must fight the chinch bugs and can do it with soybeans and at the same time make money out of it, then I am for it. That's the kind of war I like to engage in."

Under the invitation of the County Farm Bureau the business men of Warrensburg and Holden have put up $1200 in cash for prizes to be offered for the most successful growers. Seed enough to plant from one to four acres is furnished free to each contestant, but the contestant agrees to pay back to the Bureau next fall one and a half bushel of soybeans from his crop or $3 in cash. The first prize is $200 cash for the greatest yield of soybeans grown on one acre and this is followed by other prizes of $25 and lower. These large prizes are offered on the condition that 1000 acres are entered in the contest. Should there be only 500 acres in the contest then the prizes will be only one-half as large.

The farmers, business men and newspapers are taking hold of this contest in admirable fashion and if Johnson does not have soybeans for sale next year instead of wanting to buy we will miss our guess. The interest in the contest is shown by the fact that the county papers are devoting large space to exploiting it and one paper, the Star-Journal, has given over the front page to the plan and to information about the crop. The reasons given by Mr. Long for putting on this contest are summed up as follows: They make a crop wet or dry. They are well adapted to thin land but will grow on any kind of soil. The crop has already been raised in the county sufficiently to prove its value over other crops. The crop is profitable, the seed often selling for $3 a bushel. Yields of from 10 to 17 bushels of seed per acre were grown last year and then there is the hay crop besides. Soybeans do well when planted with corn and it is thought they protect the corn from chinch bugs. Oil is extracted from the beans and the meal is equal to cottonseed meal for feeding stock thus insuring a market after the seed demand is supplied.

Why should we stand back and criticise others for what they are trying to do? Why not get into the game ourselves and try to win? We would not advise dropping off a large acreage of any established crop to grow soybeans but every farmer who feels the need of protection against drouth, against the loss from chinch bugs and who wants to find a crop that will grow on thin land and a crop that will help to improve the fertility of the land should try at least a small acreage of soybeans this year.

Keep your eye on Johnson County team work for the eradication of hog cholera, the growing of soybeans, for marketing eggs directly, for the girls' tomato clubs and other useful lines of work inaugurated by the Johnson County Farm Bureau. No individual or community can stand still. We must either go forward or backward and the way to go forward is for every man to put his shoulder to the wheel and push.

Map No. 1. Showing distribution of hog cholera before the anti-hog cholera campaign was started by the County Farm Bureau under the direction of Dr. J. W. Connaway, Veterinary Department, University of Missouri.

Map. No. 2. Showing distribution of hog cholera and herds treated from Oct. 1, 1914, to March 21, 1915. The open circle (o) indicates farms where the herds were treated for protection. The solid (.) shows where cholera was found during these six months. Compare these two maps to get the value of the clean-up work.

Studebaker
WAGONS BUGGIES HARNESS

THIRTY-FIVE YEARS OF FAITHFUL SERVICE

In the fall of 1878 we needed a wagon to haul our wheat. Mr. Smith arose early one morning, and riding one horse, led the other to Eugene, ten miles away, and bought a Studebaker wagon from A. V. Peters, the Studebaker agent there.

I well remember his getting home at midnight, for I sat up and kept his supper warm for him.

My eldest child, born in June, was three months old.

The old Studebaker is still our favorite wagon. It is in good condition.

Mrs. W. T. Smith,
Natron, Oregon

Her "Baby" is now 35 years old—born year Studebaker was bought

MRS. SMITH of Natron, Oregon, well remembers the day her husband drove home the Studebaker, for her little one was three months old. And during all the years he was passing through babyhood, boyhood and on to full-grown man's estate, that faithful wagon was at work making money for the family and cutting down the cost of the investment.

Built with a reputation for durability

Such durability would not seem surprising to you if you knew the methods, the material and the men on which the reputation of Studebaker wagons is based.

Studebaker wagons owe their long life to the manner in which they are built, and the materials built into them. Air dried, selected lumber alone is used. Steel and iron are tested for ability to stand strain and stress. Even the paint and varnish used on a Studebaker wagon undergoes a chemical analysis.

And there is a great deal more in manufacturing wagons than the mere fact of putting wheels, gear and body together. A wagon must hang right and ride right. It must be built to stand rough work, to carry all sorts of loads and to travel over all kinds of roads.

Studebaker has been building farm wagons for sixty-three years, and they know how. Skilled workmen, a model plant that covers over 100 acres, and extraordinary purchasing facilities all help to make the Studebaker Wagon the best.

Studebaker also manufactures Buggies and Harness of the same high standard of excellence.

PRACTICAL FARM PAPERS—No. 11

A man came along the other day and said that he did wish we could go back to the "good old times" of fifty years ago, and I said, "Please excuse your uncle, C. D." Since we had that talk about old times, I have been looking about, and thinking over the difference between farm life in 1860 and 1915, and will write of some few things as I see them on my own and nearby farms. Our team is a rather light one of three horses, but Harry goes out in the morning with the light, fourteen-inch sulky plow, turns a fourteen-inch furrow seven inches deep, all day, two and a half acres, and turns it easier on the team than we did a ten-inch furrow, six inches deep, with the old Thompson walking plow, and he does not have to lift a 110 pound plow, six feet, at each corner. When he harrows he takes the sixty-tooth nine-foot steel harrow, and does more good at one working than we did at two workings, "half lap" with the old A harrow. Fifty years ago this spring, we planted twenty acres of corn. First father furrowed the land one way with a one-horse plow, then we were ready to plant. He started to furrow cross ways. Mother and I dropped the seed while uncle Jim and another man covered with hoes, it taking about two and a half days to plant twenty acres. When we go to plant now, one man gets on the check rower and with two horses plants ten acres a day, or more, even in our small fields and short rows.

I have cleared an acre of land since last fall, with only three or four days work to do on it now.

I compared my ax with the old six-pound Williams hand made ax that cost $2 in 1860, and my mattock with the one "Uncle Sam" Yearsley made for father in 1865 at a cost of $2.50, and I guess that if I had had such an ax and such a mattock, that acre of timber would all be standing yet, while my new tools cost $1.25 each, as against about double for the old ones. Why, even the whetstone that I use to edge up the ax when it gets a little dull, cuts pretty near as fast as the old grindstone, that used to hang on two poles by the corn crib, and that whetstone is an artificial stone, too.

On the old 1000-acre farm grandfather owned, a 200-acre crop of wheat was reaped with sickles "back in the 40s," and father said that one day they had thirty reapers, all too cook for in an open fire place, all working at 75 cents a day, three meals and whiskey. He said that the women brought out a lunch for the men at nine o'clock in the morning, and another at four in the afternoon, a bucketful of hot water, sugar, ginger and whiskey with the afternoon lunch, to enable the men to stand the heat better! He said that the bottle of whiskey was sent to the field as regularly as the drinking water, and that while most of the men drank very moderately of it, all expected it, even to the extent of refusing to harvest for the few men who were "so mean, as to not furnish whiskey."

With our 100-acre farm, the fifteen to twenty-five acres of wheat is but a two days harvest job at the most—three men, three horses, and no whiskey.

That 200-acre wheat crop was threshed with a "ground hog" machine, simply a toothed cylinder and concave, the machine threshing, but not cleaning the grain, an operation which was performed with a "windmill," as the wheat fan of that day was called.

Sixty years ago we took the county paper and a city weekly, and got them from the postoffice, three miles away, on Saturday afternoon. Now we take a dozen weeklies and a city daily, and at one o'clock p. m. I have read the news up to two o'clock this morning. Next Monday morning, "Big Ike," our carrier, will make his first trip by automobile and we will get our mail by ten oclock in the morning instead of eleven o'clock, as we have been doing for the past eight years.

No, sir, I don't want to go back fifty years, and the man who sees 1965 will not want to go back to 1915 either.

C. D. Lyon.

APPLICATION OF LIME TO THE SOIL

An application of lime to the soil may become necessary on account of two general causes: First, because of an actual lack of available lime in quantities sufficient to properly and fully nourish the growing plant. Calcium is one of the ten chemical elements absolutely essential to normal plant development; and if it be wholly lacking in soils, even though the other essential elements are present in abundance the plant cannot develop naturally. Rarely, however, are soils encountered which are entirely without lime, although it is quite common to find soils which have been derived from granite rocks, sandstones or mica-schist, in which the percentage of lime is very low. In soils thus deficient in lime it would be correct to say that an application of this material would serve to furnish a direct plant food and when such a condition obtains, lime may be said to stand in the same class with other carriers of plant food usually used as fertilizing agents, such as acid phosphate, tankage, bone meal, etc.

Many soils, however, are abundantly supplied with lime by nature, so that it seldom becomes necessary for those who cultivate them to resort to liming. It would be just as irrational to apply lime where it is not needed as to omit it where it is required, and hence arises the necessity of ascertaining the needs of particular soils in this respect. This class of soils is usually formed by the decay and disintegration of, or the effect of former glaciation upon, limestone rocks. It sometimes happens, however, that even soils of limestone origin show benefit from liming also.

The second, and in the light of present experimental evidence, by far the more important reason for applying lime to the soil is for the purpose of counteracting the evil effects of free acids which may be present.

When the remains of plants undergo decay upon soils deficient in carbonate of lime and magnesia, acid or sour humus is likely to be produced, which is a condition particularly noxious to most agricultural plants. Such a condition is especially likely to occur even in upland and naturally well drained soils whenever heavy crops of green manure are plowed down, particularly in hot weather. In all such cases liming is an effectual and probably the most economical remedy.

Experiments have shown conclusively that where an application of plant food is required some form of available phosphorous must receive first consideration. But when soluble phosphates are applied to soils deficient in lime and magnesia the phosphoric acid combines with the iron and alumina of the soil to form compounds which are not readily utilized by plants. If, however, the soil is fairly well supplied with lime and magnesia this transformation is retarded so that the plant is afforded an opportunity to utilize much of the phosphoric acid before it becomes unassimilable.

Physical Effects of Liming.

The effect of lime upon the physical condition of the soil is oftentimes an important consideration in the practice of liming. Many clay soils when wet by rains are not porous enough to allow the water to pass through them with sufficient rapidity. In consequence we have a heavy water-logged soil and the air which is necessary for the healthful development of plant roots is excluded. In times of drought, also, such clay soils, as well as certain loamy soils, containing a considerable amount of clay, have a tendency to cake readily, thus becoming more difficult to till and less adapted physically to the growth of plants.

By causing the soil to become more open and friable, lime becomes an effective remedy for all of these unfavorable conditions. In this connection it will be readily seen that on heavy clay soils, lime becomes an important adjunct to effective drainage, since the soil having been rendered more porous by the action of lime, the excess of water is permitted to pass through it more easily and is more readily carried away by the drains.

On sandy soils lime has an exactly opposite effect. Such soils are frequently benefited by being rendered more compact and hence have a tendency to become less leachy in character and to be more retentive of moisture. It should be the aim to increase the organic matter in such soils by the use of stable manure, or by the occasional plowing under of green crops.

The process of nitrification is materially assisted and magnified by the presence of an abundant supply of lime in soils. Nitrification being the breaking down of the ammonia and nitrogen compounds in organic matter and the conversion into nitrate, the form in which nitrogen is chiefly assimilated by most cultivated plants.

The utilization of atmospheric nitrogen by certain leguminous plants (notably the clovers) is facilitated by the application of lime.

Both the process of nitrification and the assimilation of atmospheric nitrogen are processes which depend largely upon the activities of certain microscopic organisms in the soils. As a rule these organisms are partial to a neutral or slightly alkaline environment, and unless lime is present in sufficient quantities to prevent the development of an acid condition of the soil, the organisms cannot remain active.

Liming Sometimes Injurious

In view of the beneficial effects which nearly always follow an intelligent application of lime, it must not be supposed that it is impossible to overdo the business. Excessive amounts of lime may have an injurious action. This is particularly true of freshly slaked or caustic lime when used on soils containing small amounts or organic matter.

Continued success from liming can only be obtained by the use of the other essential manurial fertilizing constituents in connection with the lime. I know of no case on record where soils originally in need of lime have failed to continue to give good results from liming where care was taken to maintain a supply of the other essential constituents and where lime was applied in moderate amounts and the soil kept stocked with a reasonable quantity of organic matter.

The frequency with which liming should be practiced depends upon conditions; for example, upon the character of the soil, the quantity of lime employed at each application the number of years involved in the rotation, etc. The experiments on this point thus far indicate that two tons of ground lime-stone applied once in 5 or 6 years will be sufficient. Only very exceptional cases would call for a larger application. If soils which are very acid and have not previously been limed, are to be seeded, with the intention of allowing them to remain for a number of years, perhaps an application of 2 to 2½ tons might be advisable.

Purdue, Indiana, University.

FARMERS' CO-OPERATIVE GRAIN ELEVATORS

Just now the subject of co-operation among farmers is receiving a great deal of consideration and farmers are coming to realize that it is just as essential to cut down the cost of marketing a crop as it is to increase the amount produced. Some progress has been made in Missouri in establishing co-operative creameries, and co-operative societies for handling strawberries, peaches, etc., but so far not much has been done along the line of selling and buying grain. Co-operation for handling grain seems to have made much better progress in the Northern grain states and perhaps Minnesota has taken the lead of all others. We reprint the following excellent article from Farm, Stock and Home, by L. H. Weld, which shows many of the advantages of co-operative grain elevators, but also some of the reasons for failure:

There are two phases of the co-operative grain marketing problem: First, local co-operation through farmers' elevators; and, second, co-operative terminal marketing, whereby farmers establish their own selling agencies in the primary markets.

The farmers' elevator movement may be said to have begun about 1890. There were a few formed before that date, but most of them failed. The conditions which led to their organization are familiar to most students of our economic history. The collection, storage and shipping of grain were in the hands of line elevator companies, i. e., companies with headquarters in such cities as Minneapolis and Chicago, which owned chains of country elevators along the lines of the various railroads. In the early days these line elevator companies were rapacious and unprincipled in their dealings with the farmers from whom they bought their grain direct. They manipulated prices to suit themselves. If they offered what were ostensibly fair prices for grain they were only too apt to underweigh or undergrade the grain, or to dock the farmer unfairly for dirt and foul seeds. Secret favors from the railroads strengthened the position of these line elevator companies and made it difficult for the farmers to ship independently or co-operatively.

The Farmer Enters the Field

When the farmers finally determined to enter the field they were beset by many obstacles. In the first place, it was difficult for them to procure trackage sites from the railroads for their elevators. And when they did procure sites and built their elevators, every possible device of destructive competition was brought into play by the line elevator companies to kill them off before they could get fairly started. Add to these difficulties the inexperience of the farmers in business affairs and the resulting poor management of their elevators, it is only natural that a great many failed. But in spite of early discouragements the farmers persevered; and today we have a goodly number of successful farmers' elevators in many of the states of the grain belt—notably in Illinois, Iowa, Wisconsin, Minnesota, North Dakota,

South Dakota, Nebraska and Kansas.

Within the last ten years, farmers' elevators have been gaining very rapidly on line elevators in Minnesota. The farmers have not only been gaining in number but the latter have been rapidly decreasing. Some line elevators have been torn down, and the lumber hauled to Montana to be reconstructed. In 1906 there were in Minnesota 1,199 line elevators and 151 farmers' elevators. In 1912, according to the Railroad and Warehouse Commission, there were only 777 line elevators and 300 farmers' elevators. The Railroad and Warehouse Commission classifies as farmers' elevators all country elevators that call themselves by that name, but as a matter of fact, many of the so-called farmers' elevators are not owned by farmers at all.

In accordance with a law passed at the last session of the Minnesota Legislature, the University of Minnesota was authorized to obtain annual reports from all co-operative organizations in the State.

The Farmer as Elevator Owner.

As a result of this investigation, it has been found that on January 1, 1914, there were practically 270 elevators in Minnesota in which farmers owned more than 50 per cent of the stock. In most of these companies, farmers own practically all of the stock. These 270 elevators have an aggregate membership of about 34,500 farmers, an average of 128 members to a company. One farmer out of every five in the State belongs to a farmers' elevator company. One company has 600 members, one 500, two 400, and four between 300 and 400. The aggregate volume of business of these companies may be estimated from the reports received as approximately $24,000,000 per annum, of which about $22,000,000 represents the value of grain marketed and $2,000,000 the value of supplies, etc., purchased for members. The grain marketed through the companies constitutes about 30 per cent of the grain marketed by Minnesota farmers.

Extent of "Co-operation"

Of 239 companies reporting, all but thirteen, or 94.5 per cent of the total, have the one-man-one-vote principle. As for the limitation of number of shares, 39 companies, or 16.6 per cent of the number answering this question, set no limit on the number of shares that one person may own. The other five-sixths of the companies set limits ranging from three shares to fifty shares. One has a limit of 100 shares. Sixty-nine of the companies, or 30 per cent of those reporting, set the limit at ten apiece. Most of the others set limits of four, five or eight shares apiece. Twenty-six per cent of the companies report that they limit the dividends on capital stock, and distribute the balance on the basis of patronage. The size of the stock dividend is of interest in this connection. Only one limits it to 5 per cent; only nine to 6 per cet, three to 7 per cent, thirteen to 8 per cent, and sixteen—or the largest number of all—pay a dividend of 10 per cent before they distribute anything on a patronage basis. In other words, the patronage dividend has not been widely adopted, and in the majority of cases where it has been adopted, more than the current rate of interest is paid as a dividend on stock.

There are many who will doubtless conclude from these figures that the farmers' elevators of Minnesota are not co-operative in the true sense of the word. When elevators are owned and operated by farmers, however, and when they limit the capital stock that each member may own, and also have the one-man-one-vote principle, I believe that such companies are entitled to be considered as co-operative. Not but what I believe in the patronage dividend, for I think that every farmers' elevator should have it.

If a farmers' company can be run on a no-profit basis, so that there are no profits to divide, it is immaterial whether it provides for a patronage dividend or not. This is the case with live stock shipping associations, which distribute the full receipts from each shipment among all who ship. In the case of farmers' elevators, there are some that make large profits, but they are few in number.

During 1913, about 20 per cent of all farmers' elevator companies in Minnesota actually lost money. Out of 139 companies reporting, 59, or 42 per cent, paid no dividends at all on stock; there were only 18 companies out of these 139 that paid over 10 per cent. One paid 125 per cent, but that company has since adopted the patronage dividend. There were two that paid 25 per cent, and 6 that paid 20 per cent. Twenty-eight paid 10 per cent dividends.

The Reasons for Failure

It is apparent that many of the companies are having hard sledding, and it is well known that a few fail each year. These failures are due principally to poor management and inadequate accounting systems, and to the competition of line elevator companies. I visited a farmer's elevator in Southeastern Minnesota not long ago that had lost over $5,000 in one year. I found that it had marketed about $200,000 of grain and live stock and that this big business had been managed by a retired farmer who was hired for $50 a month. The books were in such bad shape that it was impossible to tell just how far behind the company was. It was not hard to determine why this elevator lost money, however, because I found that it had been handling large quantities of barley on a cent-and-a-half margin.

The average salary of managers of farmers' elevators of Minnesota is $1,032 a year, or $86 per month. The average salary of managers of elevators that made profits during 1913 was $1,056 a year, or $88 per month; of those that lost money, the average salary was only $933 per year, or $78 per month—$10 per month less than the successful managers received. Although the best of managers may have bad years, due to poor local conditions, there is apparently a definite relation between the size of salaries and the ability of managers.

Who Puts Up the Money?

Another interesting question is the method of financing farmers' elevators. The elevator has three sources from which it may borrow money: First, the grain commission men at the terminal market; second, local bankers; third, individual farmers. Information on this point has been procured from 158 of the 270 farmers' elevators in Minnesota. Fifty-one per cent report that they are financed in whole or in part by commission men; 72 per cent report that they borrow more or less from local banks; and only 13 per cent borrow from farmers. About one-fourth of all the elevators report that they are financed exclusively by commission houses. The average rate of interest charged by commission houses was 6.7 per cent; by local banks, 7.4 per cent; and by farmers, 6.3 per cent.

Although farmers charge the lowest rates, the commission firms charge much lower rates than the local banks. Local banks are often unable to extend sufficient credit, both because of lack of funds and because of the law limiting the proportion of capital or surplus that may be loaned to one person or company. The commission firms are, of course, glad to lend money in order to get the elevators' consignments, and a written agreement is required stipulating that the elevator company ship all or a certain proportion of its grain to the commission house that makes the loan. The commission firms in turn borrow from Minneapolis banks, and do not aim to make any profit on this transaction.

Although there is some disadvantage in an elevator's tying itself up with a single commission firm, it must be remembered that in the past there has been practically no other source from which the elevators could borrow money and that the commission men have performed a valuable service, especially in newly settled communities. Reliance on local sources is increasing rapidly in Minnesota, while in North and South Dakota the elevators still mainly depend on the commission firms.

What the Elevators Purchase

One of the most important features of the farmers' elevators of Minnesota is the extent to which they serve as a means of purchasing supplies for farmer members. Those who are interested in co-operative purchasing will do well to study the importance and methods of the farmers' elevators of Minnesota. As already said, the aggregate value of commodities purchased in this way through the farmers' elevators of Minnesota amounted to approximately $2,000,000 last year. Sixty-three per cent of all elevators reporting buy coal, 41 per cent feed, 40 per cent flour, 35 per cent binding twine, 18 per cent seeds and 16 per cent salt. Among other commodities handled are cement, tile, farm machinery, lumber and fence posts, oil and wire fencing. All but 41 companies out of 239 reported the handling of some commodity other than grain.

The Most Practical of the Lot.

I am sending you my renewal for your paper for three years and wish to state that I am taking five farm papers, one of them a dollar and a half a year paper, and I consider The Missouri Farmer the most practical of the lot. Chas. B. Keith,
Libertyville, Mo.

Firestone

Producing the Proof in Quality and Price

HERE they are—plain as day—the "extras" in Firestone Tires that cost you nothing extra!

Examine the section—note the piled-in values you get at average price; you need the extra fabric; you need that cushion stock—there isn't any in the average tire; why do without it when the cost is the same for Firestones?

The reason why Firestone Tires deliver so much more Mileage is in the "extras" you see here. And the reason for these "extras" is in the Firestone production—a simple business question of making and selling. Nobody can equal Firestone in Economy of Manufacture and Distribution.

Firestone Tires are made in the Largest Exclusive Tire Plant in America; they are made by experts whom "practice makes perfect"—this saves you money.

Firestone methods of marketing are so managed that you get the tires, tubes, accessories—whatever you need in tire service—with least handling and expense—this saves you money.

Examine the section—remember, too, that you get the same relative degree of Mileage no matter what size of tire you buy. The values are there—beyond question or dispute.

Your dealer has Firestones—for motorcycle as well as automobile. If not, he can get them easily.

Firestone Net Prices to Car-Owners

	Case Round Tread	Case Non-Skid	Grey Tube	Red Tube
30 x 3	$ 9.40	$10.55	$2.20	$2.50
30 x 3½	11.90	13.35	2.60	2.90
32 x 3½	13.75	15.40	2.70	3.05
34 x 4	19.90	22.30	3.90	4.40
34 x 4½	27.30	30.55	4.80	5.40
36 x 4½	28.70	32.15	5.00	5.65
37 x 5	35.55	39.80	5.95	6.70

Firestone Tire & Rubber Company, Akron, O.

"America's Largest Exclusive Tire and Rim Makers"

Branches and Dealers Everywhere

Actual Size 5-inch "Non-Skid" FIRESTONE

Fig. 1. 7 plies of Sea-Island fabric in Firestone —some are satisfied with 6.

Fig. 2. Extra coating of finest rubber between fabric layers in Firestone —not in the ordinary.

Fig. 3. ⅛ inch Pure Para Rubber cushion layer in Firestone —none in the ordinary.

Fig. 4. 3-32 inch Breaker Strip of Sea-Island fabric and high-grade rubber in Firestone —less in the ordinary.

Fig. 5. ½ inch Tread, tough, resilient, gripping in Firestone —less in the ordinary.

Fig. 6. ⅛ inch side wall of strongest rubber in Firestone —less in the ordinary.

Fig. 7. Firestone Bead, built into tire specially for clincher rims in Firestone.

In the ordinary tire the clincher part of bead is only a patch applied to straight side type to fill "clincher" space.

Yet you pay only $39.80 for this 37 x 5 inch Firestone NON-SKID—20% below the average of four widely advertised makes.

Firestone Tube Bag Free

Send us your dealer's name and the make of your tires and we will send you, free, a fine rubberized Tube Bag. Will keep tubes in prime condition. Write today. Get also, the Book on Care and Repair of Tires. Ask for Book No. 41

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII May 1, 1915 No. 9

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year In Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

BOYS' AND GIRLS' CLUBS

One of the best lines of work inaugurated by the University in recent years is the organization of boys' and girls' clubs. It matters not whether the club is organized for a contest in sewing, canning, cooking, growing tomatoes, feeding pigs or lambs or growing corn or whatever it may be the boy or girl who succeeds in winning a prize in one of these contests has his or her mind directed toward a successful business career. How many farmer boys or girls from ten to fifteen years old who can earn for themselves, independent of the regular work on the farm or in the household, forty or fifty dollars during the summer? On another page in this issue of The Missouri Farmer we print an account of a little girl only twelve years old who raised on one-tenth acre of ground last year tomatoes which she sold for fifty dollars. She had to walk a mile from home to cultivate the ground and gather the tomatoes and our readers will call to mind what a drouth we had last year, but in spite of all that this little twelve-year old girl got more money from a crop raised on sixteen square rods than thousands of farmers produce on eight hundred square rods (five acres at ten dollars an acre). Accounts are given of other girls who made from thirty to forty dollars from one-tenth of an acre for the tomatoes sold besides valuable prizes received at the county exhibit.

The girl who honestly earns the reputation for baking the best bread, canning the nicest fruit, sewing the best seam, or making the most profit from a garden she cultivates with her own hands, has already built the first round of a useful life. The boy who will put in his spare moments grooming a colt, feeding a pig or cultivating a field of corn with the hope of winning a prize at the county fair is laying the foundation for a successful farmer.

It is not necessary to take away from the boy or girl the time necessary for amusement and recreation in order to give them time to look after these special things. But when they become interested in a contest they will use their time to better advantage, they will work with more encouragement and with better heart and more intelligently, too, because they have their minds fixed on accomplishing something definite. If a club for boys and one for girls could be organized in every school district in the state and these were intelligently directed so that they would take up work adapted to local conditions, the farm practice of Missouri could be revolutionized in a generation. But the important thing gained would be the fixing in the habits of the future farmers of the state sound principles of farm management without which there can be no success. Let every boy or girl join a club and start a bank account.

—o—

DO YOU FAVOR CHEAPER FARM LOANS?

In our last issue of The Missouri Farmer we gave a very complete synopsis of the Gardner Rural Credit Bill which was passed by the recent Legislature but which will require an amendment to the state constitution before it can become effective. The necessary amendment passed the House of Representatives but was not taken up in the Senate because it could not be reached under the rules of that body as there were a great many measures ahead of it on the calendar and not acted upon when the Legislature adjourned. To get this amendment before the people at the next election, it is necessary to submit it by iniative and that will require several thousand petitioners from at least eleven of the sixteen congressional districts of the state.

The Missouri Farmer has for many months given a great deal of space to the subject of rural credits because we think there is a real need for cheaper money to be used by farmers who want to buy a home, or to improve land already owned, to pay off mortgages maturing and probably difficult to renew under present conditions, or to buy live stock to utilize the forage that annually goes to waste on so many Missouri farms. It will be a sad day for this state if the time should come when most of the land would be owned by a few non-resident landlords and we had a rural tenant population like Ireland for instance and which has been the great handicap of the Irish people. We have now a tenant or non-land ownership problem facing us of much greater proportions than most people are aware of perhaps. Out of a total of 277,244 farms in Missouri according to the census returns of 1910 there were 192,282 farms operated by owners. Of that number 88,486 were reported to be mortgaged, 1,285 were not reported and 102,514 were reported free from debt. Thus it will be seen that out of every 100 farmers who are farming land they are said to hold title for more than 46 of them are struggling with a mortgage. If to the number of farmers with a mortgage we add the number operated by tenants we find there are 63 farms out of every 100 operated by either a tenant or a mortgagor as compared with 37 who really own their farms.

Even the man who now owns a farm free from debt is vitally interested in the tendency toward tenantry and mortgaged farms because it means that his children must face this problem with increasing difficulties against becoming home owners. Neither is the interest in the question confined to farmers alone. It is a well known fact that tenant farming when compared to farming under land ownership proves that as a rule the tenant takes less interest in maintaining the fertility of the soil, he takes less interest and contributes less time and money for the improvement of roads, the building and maintenance of schools, churches and other public institutions. If the tenant then is not so efficient and prosperous and permits the land to become impoverished in the face of our rapidly growing city population it is evident that every man, woman and child in the state has a vital interest in the general question of land tenure.

In this article we merely want to call attention to the status of the Rural Credit Bill now before the people and suggest what will be necessary before the bill can become a law. In a short time we understand petitions will be ready for circulation and any farmer who is interested and would like to see this measure put into operation in Missouri should write The Missouri Farmer stating whether or not he will be willing to aid the cause by circulating a petition for signatures.

—o—

LOOKING AHEAD

It is a good thing to be optimistic, always looking on the bright side of things, but the fellow who mixes his optimism with good judgment and some forethought is always in a little better shape to get through emergencies without loss. It might be well for farmers to plan a little now against an invasion of the crops by chinch bugs which are likely to be quite numerous this summer unless the clouds favor us with more than the usual amount of rain. Last fall and winter we urged our readers to make war on the chinch bugs by destroying them in their winter hiding places and had that been done in a concerted way from 75 to 90 per cent of the bugs could have been destroyed and that much of the damage they will do prevented. Not many neighborhoods (we have not heard of one) in Missouri made any effort to burn over and clean up the fence rows, the road sides and waste places where the bugs winter and as a result the first two or three weeks of April millions of bugs came out of their winter sleep and spread over the wheat, oats and rye and very soom for every million of these old bugs there will be about five hundred millions of the little red pests sapping the life out of the growing grain. This is going to be a pretty expensive neglect this year which is promising a good crop if not molested by bugs and when we have for the first time in many years a good chance to get a dollar and a quarter a bushel or more for the new crop.

Insect pests and contagious diseases among live stock which cause more loss to farmers in this country than the combined loss of floods and drouths should not be looked upon as the visitation of an angry Providence. So far as they are in our power to control we should admit that this incalculable loss we suffer annually is the cost of neglect and ignorance. Every female chinch bug which came out of winter quarters in healthy condition is capable of producing about five hundred young which will spend the best of their short lives reducing the wheat yield and then in turn each one of these new crop bugs will increase five hundred times more to make battle on our corn. That would mean then that by destroying one bug in hibernation we would prevent absolutely the possible devasation of an army of two hundred fifty thousand.

But what can we do now as a protection for our crops? Nature may come to our relief and give us plenty of rain just at the right time and hold them in check. A few cold rains just about the time the insects hatch may save serious loss and the rain by pushing the crops along may produce a fair crop in spite of the sapping done by the bugs. About all the farmer can do now is to plant crops that are immune to bug damage. This would be a good time to set aside a field and prepare it for seeding alfalfa along in July or August. If the chinch bug will induce farmers to sow a larger acreage of alfalfa it may be a "blessing in disguise." Cowpeas and soybeans are not attacked by chinch bugs and farmers would do well to consider planting more of these crops as a protection against the bugs. They will send out of the state this year a great many thousands of dollars for cowpea and soybean seed that might as well be kept at home by growing more of these crops for seed.

When grown for a seed crop it will require only one or two pecks per acre for seeding and the yield at present prices should be about as profitable as any grain crop raised on the farm. A field of these immune crops planted beside an infested wheat field may hold the bugs out of the corn after harvest long enough to prevent material loss. Another method some farmers believe keeps the bugs out of the corn is to plant soybeans or cowpeas right in the hill with the corn.

The better and cleaner the cultivation of the crop; the richer we make our land so as to force the rapid growth of the crops; and the greater the acreage we plant of such immune crops as clover, alfalfa, cowpeas, soybeans and vetch; the more thought we give these things at the right time, the smaller will be our loss.

—o—

MUNICIPAL SLAUGHTER HOUSES

A correspondent has asked us why we do not "advocate the building of municipal slaughter houses as a partial remedy for the hold the big packers have on the live stock business of this country?" We are decidedly in favor of building municipal slaughter houses in all our good towns, but we have not thought it worth while to devote much space to the subject until the farmers show more of the co-operative spirit than has been shown in the past.

The first advantage in the public slaughter house would be in its better sanitary condition. Most of these places privately owned are unfit places for the killing of animals and dressing the meat, but in a public-owned plant under the strict supervision of the pure food department, the plants ought to be kept in a good sanitary condition. There ought to be a great economic advantage in the operation of a public owned plant. We have never been able to see any sound reason for shipping the animals necessary for local consumption to the big stock yards, paying freights, commissions, feed bills and other charges and then shipping the meat products back over the same route before the consumer can buy them. Farmers have been told this long-way-round of marketing live stock was the cheapest way because of the utilization of the by-products. But there is no reason why these by-products could not all be utilized to the same advantage if we had a number of public abattoirs co-operating in the disposal of the by-products. Public slaughter houses are successfully managed in Europe and there is nothing in the way of their success in this country except our indifference toward co-operative enterprise. We are hoping that the department of marketing of the United States department of agriculture may work out a plan and be able to get a line of public slaughter houses established. It would add profits for the farmer and save cost for the consumer.

BARNYARD GOSSIP

Have you, dear, reader, ever thought about how many things there are to do and to think about in giving you a paper like The Missouri Farmer? Has it ever occurred to you that the editors of a high class farm paper have a great responsibility resting upon them when they undertake to fill the columns of the paper week after week with information of value to the readers; with thoughts and suggestions that will encourage the fellow who has for some reason failed and may be it was for no fault of his own; with inspiration that will cause men and women to look upon the bright side of life and get pleasure out of the daily tasks no matter how hard they may be; and finally with good stories told so as to entertain the readers and make them forget for a time at least some of the things which bear upon us as real heavy burdens in our daily routine upon the farm? These are some of the things we are trying to do for our readers and we are not unmindful of our duty to the great family of readers made up of the fathers, mothers, boys and girls in the fifty thousand farm homes where The Missouri Farmer finds a place on the reading table, in keeping out of our columns any endorsement of any theory or farm practice that would lose the farmer money or any thought or suggestion that the most exacting parent would be afraid for his child to read.

Our motto carried at the head of the paper every issue is: Better farming, better farm homes, better citizenship. In order to live up to this motto it is our aim to have every page, yes, every paragraph in The Missouri Farmer contain nothing to offend but something that will either interest, entertain, instruct or inspire our readers. A big book could be written about better farming, better farm homes, better citienship and then not half the story would be told. At the very bottom of all our success is better farming. No man need be ashamed to admit that his farming is not perfect farming for there is no such thing and perhaps there never will be because there are some things we cannot control altogether. But any man should be ashamed to admit that he is not trying to improve on his methods and make his farming better every year than it was the year before. There are a great many sources from which we may get points on better farming. The first perhaps is from closer observation and study on our own farm. Of course we can not make an experiment station out of our farm but it is quite possible to try out one or two new varieties of any crop we are growing and also to try a small plot of any new crop that has been recommended by the farmers of other sections or by trial at our state experiment station.

—o—

After our own resources have been exhausted for improvement we should utilize the knowledge of our neighbors. There is not a neighbohood in Missouri or any other state where at least one man can be found who is doing something better than the average. He may do some things poorly, he may be a positive failure along certain lines but if he has a better way of digging a ditch, setting a post, stacking hay, shucking corn or sawing wood or whatever it may be why not just get over the fence, tell him you want to learn his way because it is a better way than you have been doing it and give him full credit for showing you how. Selfishness is one of the worst traits of human nature and I think we farmers have about as much of it as anybody else. One reason for our selfishness is our isolation which makes us depend very much on self for everything we have done, but we can not afford to be so much wrapped up with self that we shut out improvement no matter where it may be found.

—o—

After selfishness comes prejudice which has closed the eyes of many a good farmer to things he could have used to his own advantage. We have seen men very much prejudiced against agricultural papers just because some farm papers are edited by impractical men and because some erroneous doctrine may have been promulgated by them. Just as well find fault with all farmers because some one man has practiced poor and unsound methods and has proved a failure. The man whose mind is free from prejudice is able to weigh what he reads, to discard the chaff and select only the wheat which he can use. The prejudiced man condemns an article in the paper and calls it impractical because it does not exactly fit his conditions while the unprejudiced man will analyze it, study it, cull out what don't suit him and use what does perhaps to very great advantage. And what we have said about prejudice against farm papers applies with equal force to the college of agriculture, experiment stations, farm advisers and other agencies out of which we can get some good if we will use them.

—o—

As an example of what a little carelessness may cost and how science may come to the farmers rescue we may point to the recent outbreak of foot and mouth disease in this country. First by either carelessness or incompetency of the veterinarian who found the first outbreak in Michigan last summer the infection was allowed to spread and get such a start that it has taken an army of men months of time and five million dollars or more to stamp it out. Should we find fault with the whole veterinary profession because one man was so careless or incompetent whichever it may have been? If there was any doubt in the minds of any farmer as to the value of the veterinary profession that doubt ought to be removed by the fact that notwithstanding the rapid spread of foot and mouth disease, so that at one time about half the states were quarantined and the great live stock business of the country was in danger of inestimable loss, the infection is now completely under control and possibly entirely stamped out. It could have been accomplished much quicker and consequently with very much less loss and expense had the stock men everywhere given their support loyally to the state and United States sanitary officers instead of opposing them as they did in places even in a violent way. Five million dollars may look like a large sum for stamping out this malady but had it been allowed to run its course without interference our country like most of the European countries would have had a yearly loss of several times five million dollars without hope of ever getting rid of it. So let's get rid of our prejudice, whether it be against sanitation for people or for live stock or along any other line.

—o—

This would be a fine old world if every man would accept the good in everything and from every other person. But some how or other our preconceived notions get such a firm hold on us that we can not see any good coming from those we just don't happen to like. And not only should we be ready to accept a wholesome idea for all its worth even though it emanates from a personal enemy but we should make it a part of our life to freely give for the good of others of whatever knowledge we may possess. Did you ever see a good farmer who was successful in money making, kept everything about his farm in tip-top shape and yet he was regarded by his neighbors as close, reserved and selfish? If a man has an idea worth while and does not wish any one else to use it without a royalty he ought to apply to the United States patent office and have his idea protected by letters patent. If a farmer has found a profitable way of doing a thing he can help himself by helping others with that information. Just as we have many times said in the columns of The Missouri Farmer, a good horse in a neighborhood where the horses are all good is worth more money than the same horse would be in a neighborhood of scrub horses. And the same is true of any kind of live stock or any other product produced on the farm. And so it is that the man who is successful can help himself by giving a little help to others.

If there is a daughter in your family who would like to earn a beautiful piano, have her write to The Missouri Farmer at once. She can easily earn it during the next two months.

You Sell Your Wheat By Test—
Do You Buy Your Lumber By Test?

To get the top market price for your wheat it must undergo a careful test. The man who buys it is going to know just what he is getting before he pays for it. He is going to know, not only that the quality of your wheat justifies the price, but whether that is the particular quality of wheat suited to his purpose.

Do you use the same business-like caution when you buy lumber? Do you make certain you are getting the best for the money, and that the lumber you buy is suited to your needs?

There is a range of quality, utility and price in lumber vastly greater than in wheat. When you buy lumber, buy by *test*,—insist on having lumber that has superior strength, toughness, workability, and reasonable price. Specify

SOUTHERN YELLOW PINE

The Wood of Service

Do you know that *Southern Yellow Pine has a greater breaking strength than White Oak; a greater crushing strength than White Oak, Rock Elm, Hard Maple, Shagbark Hickory or Black Ash?*—and yet is among the *easiest working, lowest priced* woods?

Those qualities of Southern Yellow Pine are not guessed at; they are determined by *test*—the *tests of the United States Government.* Here are the Government's figures, made by experts of the Forest Service in comparing various commercial woods:

Woods Tested	Breaking Strength	Woods Tested	Crushing Strength
LONG LEAF YELLOW PINE	8,630	LONG LEAF YELLOW PINE	4,280
White Oak	8,160	Shagbark Hickory	3,890
Post Oak	7,380	Hard Maple	3,850
White Elm	6,950	Rock Elm	3,740
Silver Maple	5,820	White Oak	3,510

No other wood is suited to so many different uses as Southern Yellow Pine. No matter what your use for a serviceable, easy-working, durable lumber may be—whether you are building a house, a silo, a barn, or are repairing implements, gates or buildings—Southern Yellow Pine is "best by test," the Wood of Service.

Free Plans For Farm Structures

If you have any building to do, write us, and we will send you complete plans, with specifications and cost estimates, of model barns, granaries, hog houses, poultry houses, feed racks—a wide variety of farm buildings. Those plans will cost you absolutely nothing—our purpose is solely to make you more familiar with the wonderful utility and economy of Southern Yellow Pine.

THE MOTHERLOOK

You take the finest woman with the roses
in her cheeks,
An' all th' birds a-singin' in her voice
each time she speaks;
Her hair all black an' gleamin', or a
glowin' mass o' gold—
An' still the tale o' beauty isn't more
th'n half way told.
There ain't a word that tells it; all de-
scription it defies—
Th' motherlook that lingers in a happy
woman's eyes.

A woman's eyes will sparkle in her inno-
cence an' fun,
Or snap a warnin' message to the ones
she wants to shun.
In pleasure or in anger there is always
handsomeness,
But still there is a beauty that was surely
made to bless—
A beauty that grows sweeter an' that all
but glorifies—
The motherlook that sometimes comes
into a woman's eyes.

It ain't a smile exactly—yet it's brimmin'
full o' joy,
An' meltin' into sunshine when she bends
above her boy
Or girl when it's sleepin' with its dreams
told in its face;
She smooths its hair, an' pets it as she
lifts it to its place.
It leads all the expressions, whether
grave or gay or wise—
Th' motherlook that glimmers in a lovin'
woman's eyes.

There ain't a picture of it. If there was
they'd have to paint
A picture of a woman mostly angel an'
some saint,
An' make it still be human—an' they'd
have to blend th' whole—
There ain't a picture of it, for no one
can paint a soul.
No one can paint the glory comin'
straight from paradise—
Th' motherlook that lingers in a happy
woman's eyes.

—W. D. Nesbit, in Chicago Tribune.

We call special attention to the following article and hope that it will stimulate many new centers of interest over the state in order to receive your share of this valuable fund:

SMITH-LEVER FUNDS FOR COUNTRY WOMEN

To the Editor of the Homemakers' Section, The Missouri Farmer:

You ask me to tell, for the benefit of your readers, something about the use of Smith-Lever funds for the rural women of Missouri. You have framed your question differently than the majority of women do who ask for the same information. The usual question which comes to me is, "What work in home economics do you expect to do in Missouri with Smith-Lever funds?" Now there is a vast difference between "work in home economics" and "work for rural women." In fact, as I go more deeply into the problem, I am more and more impressed with the thought that the questions which especially interest rural women are, in large measure, not home economics questions at all. When I ask rural women to tell me the most important matter which, in their estimation, needs the attention of Smith-Lever funds, it is the exception, rather than the rule, to have them name as their first choice a strictly home economics subject.

Work for the betterment of rural schools, whether it concerns boys or girls, is of vital interest to the women of Missouri. Similarly the problems of the country church and the social community are women's problems as much as they are problems of the men. In a broader sense every problem of the farm is a woman's problem because in the end the farm is but the means of supporting the farm home. As a matter of fact a careful study of rural statistics shows us that about all that the average farm does is to support a home with just enough of a margin in the good years to give assurance that the farm will be able to continue to support the home in the bad years.

As nearly as I have been able to obtain an expression of opinion from farm women, their problems are not so much questions of how to cook and bake and sew; neither are they in the main, problems of labor saving devices. The big problems seem to be the following: First and foremost, good rural schools so that the children may have the kind of an education that country boys and girls deserve; second, live, active country churches and social organizations so that young and old alike may enjoy the good that comes from religion and social opportunities that are too much neglected in the country; third, pleasant physical surroundings which includes not only the pleasant house but an attractive dooryard with shade trees, flowers, and lawns, giving the proper setting for a home that is more than merely a place where body and soul are kept together; and fourth, modern conveniences which includes water supply, heating system, and lighting system—important in the order named. The items included in the fourth group I do not class as "labor saving devices" any more than I consider the roof on the house a labor saving device. They are essential parts of a house. The step from the house without water, heating and lighting systems to the house equipped with these conveniences is no greater than the step from the wigwam of the redskin to the log cabin of the pioneer, or from that to the average farm house of today. After all it is merely a question of standards. I presume we could all live in tents made of the skins of wild animals if that were our standard of living.

As to the specific lines of work for rural women which will be supported by Smith-Lever funds, the following have been decided upon at the present time and more will be added as the demand arises:

1. Boys' and Girls' Club Work;
2. Movable Schools of Home Economics;
3. Organization of Women's Clubs;
4. Special Demonstration Campaigns.

In order that the above may be more intelligible, I will try to tell in the fewest possible words what each one of the projects includes. Under the head of Boys' and Girls' Club Work is included a wide range of home and school study which is intended to center about the district school, bringing the home and the school into closer contact and establishing if possible the right relation which should exist between the two but which all too often does not exist. In the club work we have at the present time lesson plans and instructions for sewing clubs, poultry clubs, tomato clubs, bread baking clubs, canning clubs, corn clubs, pig clubs, and stock judging clubs. It has required a 24-page circular to give the details of the Boys' and Girls' Club Work so it would hardly be feasible for me to attempt to tell in the columns of your paper about the details of the work. Through the use of Smith-Lever and other funds, the Missouri College of Agriculture is in a position to furnish instructions, report forms and lesson plans for any boy or girl in Missouri, between the ages of 10 and 18 years, who wants to do work of this kind.

I have included, and intentionally so, boys' club work as a part of the extension work with rural women. I do not believe that any mother will take exception to the statement. The boy is as much her problem as is the girl and however we may view the subject, the cold fact remains that both the boy and the girl are far more the woman's problem than the man's.

Movable schools of home economics have come to be so well known in this and other states that a very few words will be sufficient to explain their organization and purpose. The movable school is an attempt to take to farm women within easy reach of their homes a systematic course of instruction extending through from three to five days. The College of Agriculture has not established a definite course of study for these schools. Each community is given a choice of a dozen or more lines of work and it is largely left to the local committee on arrangements what the course should cover. Before a movable school will be located in any community, the College must have evidence that there is a real local desire for such a course of instruction. Movable schools are, therefore, assigned upon the basis of applications bearing the original signatures of women who want the work and want it badly enough so that they agree over their own signatures to pay the local expenses. No statement can be made as to what local expenses amount to. Some communities demand lines of work that make it necessary to go to considerable expense; other communities desire work that requires practically no expense.

It has become a fundamental principle in all extension work that the highest efficiency can never be attained except by working through organized bodies of people. This is particularly true of the work with rural women. The Agricultural Extension Service will, therefore, make a special effort during the next year to help women to organize clubs and provide for such clubs a definite program of work for the year, which program will include not only material sent to them but, so far as possible, will include direct personal assistance. Logically the clubs which are most efficiently organized and administered will be the clubs which will receive the greatest amount of assistance. With the limited means at the command of the College of Agriculture for extension work, it will not be possible and is probably not desirable that the College should force its work upon indifferent or unwilling communities when there are other communities thoroughly alive and anxious to work, waiting eagerly for help.

At certain times in the year, the College of Agriculture will arrange special demonstration campaigns on special timely topics. The best illustration of this type of work is the canning demonstration. For the purpose of these campaigns, a series of one day, or half-day, meetings will be arranged at such hours as a demonstrator from the University can include in a continuous itinerary, and having a schedule arranged, the demonstrator will spend anywhere from a week to several weeks in repeating to different audiences on successive days, some demonstration that has particular value at the time it is presented. The field is unlimited and the amount of work that will be done will be limited solely by the amount of help which can be made available for the work. Canning is just one of a dozen things that may be made the basis of demonstration campaigns.

The exact and final details of the above projects have not been fully worked out. It is only a few days since the governor of the State of Missouri finally approved the appropriation which makes it possible to obtain at least the main portion of the Smith-Lever fund which the U. S. Department is ready to give to the State of Missouri. In the few days which have intervened, it has not been possible to work out in detail the plans of expenditure for the next year. It is my hope that by May we will be in position to tell exactly how a community must proceed in order to receive the benefit of any or all of the projects named above. One thing should be borne in mind, namely, that rural women who expect to get the greatest benefit from the funds available for this type of work should arrange their plans and dates so as to coincide with the regularly prepared schedules of the Agricultural Extension Service. As rapidly as possible an attempt will be made to prepare, several months in advance, a complete schedule for each extension worker occupying her full time. This will mean that the community which waits until the last minute, then sets a date for a meeting of a certain kind and writes to the College of Agriculture for help, will be disappointed and probably will feel that they are not getting their proper share of the Smith-Lever appropriation. It should be generally understood that efficiency demands systematic and thorough organization of the work. Such organization will be to the decided advantage of the com-

The Pride of Every Home

munity that tries to fit its plans into the organized plans of the College of Agriculture. On the other hand, the better our work becomes organized and the more systematic it becomes the more disappointing it will be to the community which insists on making its plans at the eleventh hour, setting its own dates and making no attempt to fit into the general extension organization. Very truly yours,

A. J. Meyer,
In charge of Agricultural Extension.

DENTAL HYGIENE; ITS REAL SIGNIFICANCE

Until very recently the necessity of caring for the mouth and teeth of children has not been a matter of public interest. An important part of medical inspection in schools has been neglected. Medical school inspection is the most important work carried on by departments of health; it is one of the most important functions of the State.

By the practice of dental hygiene the general public health can be greatly improved. In the fight against the great white scourage, tuberculosis, it is a factor of the first importance.

Dental hygiene is the practical application of dental science to the individual, the home and the school. A realization of its importance is needed. Everybody should know that the general health of the individual and of the community depends largely upon the condition of the mouth and teeth; that the highest efficiency and happiness in life can not be gained when the gateway to the body is neglected.

The care of the teeth is an important factor in the care of the child. The mental and physical efficiency of school children can be greatly aided by the proper care of the mouth and teeth. This is fully attested by experiments in Germany, which cover a wide field. There dental infirmaries connected with the schools have been in operation for a sufficient length of time to demonstrate:

First—That the time expended in putting the teeth in order was far less than the time formerly lost from toothache and disability caused by diseased teeth.

Second—That the cost of keeping the teeth in order was more than compensated for by better health and a consequent reduction in medical expenses.

Third—That the child became physically stronger, secured a higher average in his studies, was easier to control and was apparently happier.

A clean mouth and clean teeth furnish one of the best protections against disease. A child forced to swallow the discharges from an unclean mouth, and having nutrition interfered with by his inability to chew his food, is unable to resist disease.

The condition of the teeth is a telltale as to diet. They are the guards which stand at the gateway to the body, ready to divide the food into manageable portions, to bring peace of mind and healthful bodily activity. No greater kill-joy exists than dyspepsia, no more vicious a menace to life and efficiency obtains than disordered condition of the process of nutrition.

Cancer of the stomach is notoriously a disease of gross feeders. Eighty per cent of the cancers of the stomach arise from bolted food. If an ounce of prevention is ever worth a pound of cure it is keeping the teeth in good condition.

This problem of dental hygiene is not altogether one of benevolence. It is in large measure a problem of economics. Health is needed for great industrial production. Every case of disease involves an immediate economic loss to the community in which such events occur. There is coming a great change in the practice of medicine, surgery and dentistry and a much greater proportion of the attention of these professions is hereafter to be devoted to prevention rather than cure.—Indiana Health Bulletin.

FACTS OF INTEREST ABOUT POULTRY

If kept in the dry and properly cared for manure from the farm poultry house makes a valuable fertilizer. The droppings from one fowl will average about 65 pounds in a year. An anaysis would show that these droppings contain nitrogen, potash and phosphoric acid. This is one of the reasons why orchardists advise poultrymen to turn large flocks in their orchards during the summer months. The fowls destroy many orchard pests in the way of worms, bugs and other insects.

Some people will tell you the reason they don't go in the poultry raising business is that they are afraid of over production—that eggs will become cheap and practically without value. Besides what eggs are used for food about forty million eggs are used by the calico print works each year. Photographic establishments use millions of dozens. Wine clarifiers over ten million dozens. Eggs are used by bookbinders, kid glove manufacturers, coffee roasters and by many other manufacturing industries. New uses are being found almost daily and the demand is increasing every year instead of decreasing, and the fact remains that demand makes price.

High Roosts

If you are raising any of the larger breeds of fowls, the roosts should not be more than two feet from the floor and always on a level. If made in the old-fashioned way like stair steps one above the other the fowls will all want to roost on the highest perch. Bumble foot, lameness and other ailments are caused by high roosts.

Green Bone for Poultry

At this season of the year, before the worms, bugs and insects appear, green bone is not only relished by your fowls but forms one of the essential elements in their food ration. If a mill is not available to grind the bones they can be crushed or pounded. You can easily feed too much and cause trouble in your flock. One pound should be fed to thirty fowls once a day, or about half an ounce to a fowl. In the absence of bone feed a good clean grade of meat scrap, but do not feed blood meal, tankage or a cheap grade of meat scrap that has an odor.

Clean House

A household word as sure as spring comes. Why not apply this to the poultry house. Whitewash with some crude carbolic acid added put on with a sprayer is the best and quickest way to purify a chicken house. Remove the perches, empty the nests and spray the entire interior of the house. Whitewash the fence posts to the poultry yard. It costs little and looks well. If your fowls have been kept in pens or runs this winter sprinkle slacked lime over the ground, spade or plow it and sow to rape, cowpeas, rye or something of the sort and it will purify and freshen the ground and make it as good as virgin soil. Never allow a dead carcass of any kind to lie around where the chickens can get to it; always bury or burn them. Limberneck, a poultry disease, is brought about by eating this sort of putrid flesh.

E. L. Andrews,
Maryville, Mo.

WATER-GLASS METHOD OF "CANNING" EGGS

One of the best, simplest, least expensive and most effective method of preserving eggs is to place them in a solution of water-glass, or sodium silicate, according to a statement just issued by F. C. Hare, poultry husbandman of Clemson College, South Carolina Agricultural College.

This is a transparent liquid that looks like thin, strained honey and is used commercially in manufacturing mucilage. It covers the shell of an egg with an impervious coating of glue and prevents the entrance into the egg of bacteria-laden air, which would render the egg unfit for food. Eggs treated with water-glass can easily be kept in good condition for nine months, provided they are perfectly fresh when placed in the solution.

Procure a five-gallon glazed earthenware crock with cover, the glazing being to prevent absorption of the solution. Buy a quart or more of sodium silicate or water-glass at the druggist's. Thoroughly rinse the inside of the crock and its cover with boiling water to kill any germ life that may be there. Boil three or four gallons of water and allow to cool. When cold make a mixture of nine parts of this water and one part of the water-glass.

Fill the crock two-thirds full with the preserving mixture. As the eggs are gathered daily, put them into the crock. Do not keep eggs several days before putting them in the water-glass, as it is very important that eggs go into the crock the day they are laid. Eggs must on no account be washed and all cracked eggs and those with very thin shells that might be broken must be discarded.

Eggs may be added daily until the crock is about three-fourths full, bearing in mind, however, that at least one inch of liquid must always be above the top layer of eggs. Place the cover on the crock and set in a moderately cool place to prevent excessive evaporation of the liquid. Examine the eggs from time to time and add more boiled water if it is needed to keep the solution an inch or more above the top layer of eggs.

For general culinary purposes, water-glass eggs are equal to ordinary new-laid eggs. They may be poached, fried, scrambled or used in baking, just as they come from the crock. However, to boil them, stick a pin into the large end of the shell before heating and thus allow the gas inside a hole by which to escape when heated. The water-glass solution closes the pores of an egg shell and acts as a tin can acts around tomatoes. If an opening is not made, the shell will crack while being heated, for the expanding gas to escape. Yolks of these eggs "stand up" as do those of new-laid eggs and the white will beat into a fine froth.

According to Mr. Hare, the cost of preserving eggs in water-glass is about one and one-half cents per dozen.

BEGINNING WITH PUREBRED CHICKENS

For the benefit of others I will give my experience, how I started raising chickens and keeping them. I purchased two settings of Rose Comb R. I. Reds, range chickens, for $1 a setting, from a man who paid $12 a setting. I raised 27. Then the next year I purchased four settings from the Missouri Experiment Station. Out of that flock I took 12 of the best hens and purchasing a cockerel each year to mate with them and out of that flock I take the cockerels for my next year breeding pens.

The last thing at night when hens are on the roosts I throw whole wheat and oats in the litter under dropping boards so the hens can start early in the morning and at noon a dry mash containing 30 per cent middlings, 40 per cent bran, 20 per cent ground oats, 8 per cent meat scraps and 3 per cent oil meal and a pinch of salt and a little mustard and some charcoal.

I have fed the mash damp until this year and having lost some from being too fat when warm weather sets in. At 3 o'clock I feed chopped corn, all they care for and will eat up clean. Oyster shell and air slacked lime and warm water in winter are always before them. My hen house is open front.

I set enough hens when I set my incubators that I can give each hen thirty chicks. I put two hens with sixty chicks in a coop 2 x 4 feet and when the season advances and chicks get hardened I take one hen out leaving one to care for all. I find this more economical than brooders at least through April and May.

Their first feed is unfertile eggs with shell, then coarse ground corn meal baked in stove. Later ground oats, middlings and bran. I have experienced trouble with lice on chicks brooding with hens, but have dusted the chicks with lice killer under wings and a drop of sweet oil on their head the 7th day. I had no more trouble.

I averaged 11 eggs to every hen a month including pullets and 2-year-old hens. I now have a flock that I am proud of as a laying strain and color as rich as a red bird. If every farmer would spend $4 or $5 for 100 eggs, pure bred, Missouri would with one stroke have utility poultry, and adding some settings from Missouri Experiment Station, they would double the value of their poultry. I am a member of the Missouri Poultry Association getting valuable information that adds to my interest.

Geo. A. Menne, Cottleville, Mo.

Keep a Kodak Record.

THE photograph of the young orchard—just as it starts the summer growth—then another photograph, say in October when the growth is ended and the wood is hardening, will make an interesting and valuable record. Such pictures become a real asset when used to show *comparative growths* of trees or crops that have had different treatments in fertilizers or in cultivation.

And picture making is very simple by the Kodak method, and less expensive than you think. Ask your dealer or write us for our new booklet, "The Kodak on the Farm."

EASTMAN KODAK CO., 454 State St., ROCHESTER, N. Y.

DINGEE ROSES
Sturdy as Oaks

Our roses are strongest and best. Always grown on their own roots. More than 60 years of "knowing how" behind each plant. Safe delivery guaranteed—our guide explains. No matter where you live, you can *depend* on getting D & C roses in perfect condition. Write for

Our "New Guide to Rose Culture" for 1915—free

The most educational work on rose culture ever published. Not a catalog, but the lifetime experience of the oldest rose-growing house in America. Profusely illustrated in natural colors. Describes over 1000 varieties of roses and other flowers and tells how to grow them. Write today for this guide before issue is all gone. *It's free.* No other rose house has our reputation. Established 1850. 70 greenhouses.

FARM MANAGEMENT PAGE

D. H. Doane, University of Missouri

Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me.—Matt. 25:40.

Spring with life—new life, with swelling seed and bursting bloom, spring with all of promise, the future wrapped in tiny seeds and swelling buds, spring in the warm earth, the new calves, colts and tiny chicks, is here. God has given us at this time the new life and from it we get our hope for the future. Our thoughts, our money, our work, are bound up in this promise of spring life—this new life. I wonder how many of us are letting our thoughts and our efforts extend beyond the confines of our own farm. Are we thinking that perhaps in some place in this great land of ours there may be a little spring life in the form of a little boy or girl that does not see God's great handiwork as we do, that his or her vision is limited to dark walls and fatherless and motherless days and nights. Yes, there are many of these little ones waiting at **their** springtime of life, now at God's springtime, for the homes where no little ones gladden the hearts of parents.

This is not an abstract talk on the subject of homeless babes but a timely account of what The Sheltering Arms, a charitable institution in St. Joseph is doing for these children whose lives know no parents. The home—and it is a home as far as it is possible for the kindly love and affection of motherly Mrs. Ziemendorff to make it such—shelters fifty little folks. At present there are thirty-six children there and twelve of these are today asking **you** to share with them a **home** that knows the tender love of a mother and the guiding influence of a father. **What will your answer be?** You who live in the great big out-of-doors that gives unto young child life its best opportunities—you who so seldom see the misery and struggle of the big cities, you whose homes are best situated to the care of the lives of little ones. I say what is your answer to these tender, springtime lives that call you now?

Words cannot make the appeal as strong as the reality, and so I can but say, write or go **now** to Mr. W. A. Ziemendorff, Humane Officer, St. Joseph, Mo., and tell him that your home throws its doors open to a little life that hitherto has not come. Tell him to write you of the conditions under which you may legally adopt a little boy or girl, or perhaps a tiny babe, for at the Sheltering Arms you will find children of all ages. They are admitted there from a few days old up to six for the boys and up to fifteen for the girls. At six boys that have grown up in the home have to leave, but girls can stay longer.

It is the policy of this home to endeavor to urge parents to keep their children if possible and so if a parent will even pay a small amount toward the support of a child it is never taken away. When you go there you will see many little ones whose fathers are dead and whose mothers are working to pay enough to retain their children. Many of the little ones have neither father nor mother and they are now waiting for your home call.

It was nearly noon and I had hurried, that I might see them at the dinner hour. One little fellow became impatient and started for the dining room before his turn, and had to be brought back. This brought tears but a kindly loving pat and tender words from Mrs. Ziemendorff soon healed the hurt spot.

All were in their places. Little three-year olds and some over twelve. In many homes I see children take their places at the table ahead of their seniors and begin a ravenous claw for all within their reach. Here, not a hand touched a thing until the blessing. Until some older person said it? No, until each little voice joined with the other and **sang** it. It was a sight and sound I will never forget. Each little head bowed, each pair of tiny hands clasped and each childish voice **singing** to God its thankfulnes for their daily bread. Then I thought of the bounteous country tables I had sat before and as I saw each little hand go out to partake of potatoes, bread and scrambled eggs—I thought, yes, I thought—surely of all the good country people I know some will help fill this table.

"'You see," Mrs. Ziemendorff was saying, "we are having a treat today, the eggs." "So you call eggs a treat?" I asked. "Yes, eggs cost twenty to twenty-five cents a dozen, and it takes between four and five dozen for one meal for us and we cannot afford them often. We always have plenty of bread and ——" "and butter," I interrupted. "Oh, no, butter is our once-a-week treat. We seldom have it. Just plain bread, potatoes, milk, and most always some kind of preserved or canned fruit. Meat once a week—a cheap cut, boiled tender. The only thing I really would like to have that we cannot have is more eggs. You know these little growing bodies need muscle building foods like eggs and we just cannot afford them. As I told you, all that we have to run on is what people **give** us and when times are a little hard, we have to economize."

All this time I had been watching these little "men and women" eat. Remember, no parents to guide, correct or train them, but just the same, not one did I see do a thing that would be counted rude or bad. It shows us, does it not, that in these little bodies, coming from many different places, many different conditions, there is that little spark or seed as it were, that needs only the warm touch and tender care of thoughtful mother love to make it grow into God's own image with all the childish love and obedience that makes each little life so dear to parents?

"Tomorrow will be the last day of school," Miss Grant (now Mrs. Doane) was saying, "and children let us make as a part of our closing exercises for the year sending of a case of eggs to the childrens' home. I will have the case here in the morning and each one of you bring some eggs. Perhaps not each one can bring a dozen, but some can bring more; above all, let's **each one have a part.**" The children responded and a full thirty dozen left the schoolhouse the next day. It was the childrens' gift to their less fortunate little brothers and sisters they had never seen and who were many miles away.

In telling me of the incidents a few days ago, Mrs. Doane said, "We got more out of that one little gift than anything we did during the whole year. Parents and children talked of it and we thought more of ourselves because we helped others. It was the beginning of a new life in our district and following our gift of a case of eggs to those little homeless children, were able to improve our school, buy an organ, get new seats and make other needed changes. You see it taught us that we could work together and we had the feeling we had helped others."

Could we have a better example? Let us, and now I am speaking to rural school teachers, county superintendents, farm advisers, and mothers' clubs in the county, each do our part in sending what we have in such abundance in the country at this time of year—a case of eggs to these little boys and girls in the "Sheltering Arms Home," St. Joseph, Mo. I know they can use all you send. They can be placed in cold storage if too many should come at once. We need not fear, however, for it takes a good part of a case for one meal. If you wish to send the eggs collect, I know Mrs. Ziemendorff will gladly pay all expenses. Be sure to write or mark the case plainly so she can tell who sent the eggs. Write a letter to these little folks from your school, a letter that can be read at meal time when they are all together.

Finally, let me say that here we have two opportunities before us. One to open our homes to one of these little homeless—there are twelve of them now ready, from babies to little boys six, and little girls twelve, and the other is to do our part to provide a "luxury"—just some pure, clean, fresh eggs, for these little growing bodies. On this basis we can each do something. **Let's do it.**

Farmer Wives, Attention!

Never since I have been writing "After-Thoughts" in The Missouri Farmer have I ever made a direct appeal for your help—but I need it now and I hope you will respond—for in the things I have said and written in these pages I have plead not only for better crops and more money on the farm but for a better and happier farm life for those who toil in the hot kitchen and upon whom depends the rearing and welfare of the little ones.

Among other splendid premiums The Missouri Farmer is offering to some bright farmer girl in every community in Missouri a beautiful piano—an instrument of such quality that any girl in the state might well be proud to own it—and if there is a daughter in your family, or if you know of some bright, deserving girl who you think would appreciate this splendid opportuntiy, I am going to ask you to send me her name so we can send her the full particulars. Here is a chance to do some fine girl a kindness which she won't forget as long as she lives. If she happens to be your daughter, so much the better. Now please do this for me. I will appreciate it deeply.

Sincerely,
The Author of After Thoughts,
Care The Missouri Farmer,
Columbia, Mo.

Ownership of The Missouri Farmer

In accordance with the law enacted by Congress which requires newspapers and magazines to file a statement showing the name of the editor, business manager, the owners of the publication and the names of any bond holders, mortgagees and other security holders, The Missouri Farmer has filed the following statement with the Postoffice Department: The managing editor is Geo. B. Ellis. The business manager is William Hirth. The Hirth Publishing Company, which owns The Missouri Farmer, is incorporated for $20,000 divided into 200 shares, 189 of which are owned by William Hirth and 10 shares by Lillian Hirth.

The best insurance against loss from chinch bugs is to raise cowpeas, soybeans, clover and alfalfa. These crops are immune from bugs.

NO CLIMBING OF TOWERS IN OURS

Every bearing is constantly flooded with oil. Two quarts of oil in the gear case of the 8-foot Auto-oiled Aermotor will keep the gears and every bearing flooded with oil for a year or more. With its duplicate gears and two pitmen lifting the load straight up it is unbreakable. It runs in a breath of air. The galvanized helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; if you are tired of waiting for a big wind, let us furnish you this self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. Write

BUCKSHOT BY THE PROFESSOR

Well now, aren't you mighty thankful to be over here in the U. S. A. hopping clods rather than be dodging bullets as big as a wash tub over in France or Belgium?

I haven't got much sympathy for a farmer who stumbles along year after year without a silo, wastes 40% of his corn crop—and then raises a "holler" because times are hard.

When those fellows across the pond aren't shooting at each other they're jumping onto Uncle Sam—but old Uncle Sam is doing a land office business at the old stand just the same.

With plenty of "greens" and the creek full of catfish I am not worrying about the "high cost of livin' these days. In fact, if I was a king and they wouldn't feed me a mess of greens once in a while, I'd resign.

The Missouri Farmer is offering a beautiful piano to some bright farmer girl in every community in the state. If you know of a deserving young lady who would appreciate this splendid opportunity, have her send in her name.

It always did make me sore to see a farmer who let's some patent medicine outfit or some other concern paint a big advertisement all over the side of his barn. A farmer like that would let them paint a sign on the side of the old mule if he could get anything out of it—and if the old mule would stand for it.

I heard of an Irishman the other day who paid $7.50 for a shoat last fall. During the winter he fed it $10 worth of corn—and a little while ago he sold it for $17.50. A neighbor who heard of the transaction remarked to him, "Well, you didn't make much money on that hog deal did you?" "No," replied the Irishman, "but I had the use of the hog all winter for nuthin."

Old "Josh" Simpson says the "catfish ain't bitin' this spring like they used to back there in '62." The gang down at the livery stable say it's not the fault of the fish but that they get scared at old Joshes "headlight." "If you'd quit tryin' to catch 'em with a hook and got into a boat with that old strawberry of yourn at night I'll bet you could gig 'em by the wholesale," said "Freckles" Foster—and old "Josh" got riled and said if he was a little younger he'd lick the whole outfit.

Young Ladies, Attention!

We have a proposition to make to the bright girls in whose homes The Missouri Farmer is a visitor by which we will enable them to earn a beautiful piano. By this we don't mean a cheap, trashy instrument but a piano of the highest character and quality and one of which any young lady may well be proud. If you would like to own a beautiful piano earning it during your spare time, write to The Missouri Farmer, Columbia, Mo., at once.

DO YOU OWN A SILO?

We believe the time is not far off when every farmer who owns an average amount of live stock will find it to his advantage to build a good silo. In fact, we believe the time is not far off when there will be mighty few 160-acre farms in this and other Corn Belt states without one. During the last several dry years the farmers of Missouri have paid out millions of dollars for feed and that this means "bad times" not only for the farmer but for the town which depends upon the farm goes without saying.

That more farmers have not waked up to the utility of the silo is really surprising. Surely anything which will utilize 40% of the corn crop which otherwise largely goes to waste—surely such a saving which means that the owner will have plenty of feed to carry him through the winter and that he will not have to get down on his hands and knees to the local banker for a loan—surely anything which will do these things is worth looking into immediately and seriously.

Every spring time as one travels around over Missouri he sees corn stalks raked into wind rows and burned upon every hand—and this means not only the burning up of feed which, in the aggregate is worth millions of dollars, but it also means a wanton waste of soil fertility at a time when this is one of the most serious problems confronting American Agriculture.

There are thousands of farmers in Missouri who could have saved the cost of a good silo during the recent winter. In other words, they borrowed as much money for feed as a good silo would have cost them last summer—and the silo would serve them in a similar way every winter for years to come. The money you make out of feeding live stock depends almost entirely upon the cost of the feed they eat and the silo cheapens it immensely—so any way you look at it we say the time is here when the average farmer can no longer afford to do without a good silo. Missouri deserves to become one of the greatest dairy states in the Union but this realization will be impossible until we take better care of the big percentage of our corn crops which are now going to waste.

On the front cover of this issue appear the picture of a silo put up last year by Mr. Marshall Gordon, of Columbia, Mo. Mr. Gordon is president of the Missouri Dairy Association and owns a number of silos and is also a prominent breeder of registered Holstein cattle. This new silo is fully described in the advertisement on the back page of this issue and merits the fullest investigation of all our readers. It is manufactured by Walter Dickey of Kansas City—a man well known throughout Missouri and whose reputation is of the highest. Built out of the best quality of vitrified glazed tile, this silo should last a lifetime and we suggest that those who are in the market write the company for full particulars at once.

Interested in an Automobile?

The Studebaker Automobile Co. of Detroit, Mich., is in the market with several of the best low priced cars that have ever been offered to farmers—cars which are big and roomy and which will stand up under years of hard usage. Drop them a postal card and ask them to send you their big catalogue. Be sure to mention The Missouri Frmer when you write.

The "Old Oaken Bucket"

The " old oaken bucket" has its picturesque place in the cherished memories of childhood. It has little place, however, in the present-day scheme of hygienics. For it must be admitted that the stagnant well and the moss-covered pail are first-rate breeding places for disease.

Nowadays, the up-to-the minute captain of farm industry is looking out carefully for his water supply—not only for his family and himself, but for his stock. And he is the one to take especial interest in the announcement in this issue of an auto-oiled windmill that "works by a breath"—that runs in the slightest of air currents—busy practically all the time keeping the well pumped out—keeping the water in motion. The manufacturer says it requires but a political argument in the near vicinity to make it run industriously!

The gears and bearings are flooded with oil, which is used over and over again. Two quarts of oil will keep it running a year or more.

Surely here is a new height of efficiency reached in the construction of farm machinery. It merits a place with the auto-plow, the motor-churn and the 8-cylinder "buzz-wagon!"

A Splendid Almanac Free

With a wealth of information and more attractively gotten up than in former years, the Studebaker Almanac for 1915 is being rapidly distributed to the thousands of American farmers to whom the name Studebaker is a household word.

Contained within its covers is information dealing with the care of live stock and pages of well worked out instructions as to the care of soil, the time of planting, rotation of crops, fertilizers, hot beds, cold frames and all the knowledge that experts can give to aid the farmer.

There is also much useful discussion of household problems, health and first aid, implements and tools, poultry, pruning, silos and silage. In fact, the Studebaker Almanac is a compendium of useful information for the farmer in all parts of the country. It is in line with the life long policy of the Studebakers to win and retain the good will of the farmer.

Studebaker wagon dealers all over the country can supply you with this Studebaker Almanac. In the event of their supply running low, a postal card addressed to Studebaker, South Bend, Indiana, will bring you a copy free of charge. Alway mention The Missouri Farmer.

How About Your Automobile Tires?

Every farmer who owns an automobile should write to the Firestone Tire and Rubber Co. whose advertisement appears elsewhere in this paper and ask for their "Service Bulletins" which tell you how to get twice as much service out of your tires as you ordinarily get. A postal card will bring you this very valuable information. Always mention The Missouri Farmer.

Holstein Bull Calves

A fine lot of very high grade Holstein bull calves out of grand daughters of the famous Missouri cow, Chief Josephine, and sired by a son of the premium state fair cow. These calves are in fine condition ready to ship now at $25 each. This is a rare opportunity to get a bull of the best breeding to improve your milk stock. Better order now as I have had to return money for orders I could not fill.

D. D. MOSS & SON

Hereford Bulls For Sale

A few registered Hereford Bulls ready for service, priced to sell. Satisfaction guaranteed. Can ship from McBaine or Columbia, Mo.

W. D POWELL, McBaine, Mo

LIVE STOCK NOTES

R. P. Royce, Fieldman

Spotted Poland Boars and Jersey Bulls

The Ennis Farm, Horine Station, Mo., is now offering a dozen big boned Spotted Poland China November boars. The boars are of strictly spotted breeding and are the type that has made spotted hogs so popular. This farm also has a big lot of spring pigs coming on that will be ready to ship before long and orders are being booked now for June and July shipment.

Mr. Ennis advises us that he also has a nice lot of Jersey bulls that are just old enough for light service that he is making very low prices on.

The Sunset herd represents a very choice collection of richly-bred, high producing Jerseys. It will be recalled that this herd was headed by the $5000 Blue Bell's Golden Roseboy, half brother to the great Noble of Oaklands, and over thirty of his daughters are now in the herd. Young bulls sired by Rosebay's Golden Fern, another grandson of Golden Rosebay, are now in offer. The dam of this bull was Fern's Usefulness, with a yearly record of 10,000 pounds of milk, and a seven-day record of 24 pounds of butter.

Mr. Ennis is not asking high prices for this stuff and any of our readers who are interested in adding new blood to their dairy herds will find it to their interest to correspond with Mr. Ennis.

Holsteins Wanted

W. F. Phelps, Aurora, Mo., is in the market for about twenty-five head of pure bred Holstein cows. He would be pleased to hear from any of our readers who are in a position to fill this order. Give price and full particulars in the first letter.

Thomson's Durocs

George Thomson, of the firm of W. H. & Geo. E. Thomson, Columbia, Mo., advises us that their sows are farrowing and saving excellent litters and that they will be ready to book orders for spring pigs before very long. Messrs. Thomson seem determined to build up one of the leading herds of Durocs in the Corn Belt and the past winter they have been contending bidders for the better sorts at most of the leading sales in this state. They have succeeded in getting together a very high class, uniform, lot of big sows and are mating them for the most part to Col. Wonder II, one of the best sons of the champion Col. Wonder. Readers of The Missouri Farmer are urged to keep this herd in mind when they are in the market for Durocs with size and quality.

Baker & Sons' Poland Chinas

W. A. Baker & Sons, Butler, Mo., will soon be ready to ship spring boars and gilts and we would suggest that those of our readers who are going to need a boar this fall write Messrs. Baker and ask that they reserve you a good one. Most of the spring stuff is sired by the good young boar, Big Bone's Son Jr., the junior champion at Sedalia last year. This boar was bred and shown by W. E. Willey, the Nebraska breeder whose herd attracted so much favorable attention at the important shows last year. He was sired by Big Bone's Son, and his dam was Anna Price 11th by Pawnee Lad. Last year, besides winning at Sedalia, he was first at Lincoln, first and champion at Topeka, second at St. Joseph, and third at Des Moines. He has about everything that a good boar should have; one knows that he is right individually by his winnings; his pedigree is strictly big type breeding, and he is proving to be an excellent sire.

Peabody Shorthorns

Last week we had the pleasure of spending a day at Peabody Farm, Marshall, Mo. This is the home of June K. King & Sons, and on this magnificent farm is maintained a very high class herd of Shorthorns and an equally high class herd of Berkshires.

Quite a story could be written about this farm, and if one was looking for evidence as to the soundness of the doctrine of maintaining the fertility of the soil by keeping good livestock in connection with farming operations, one need not look any further than Peabody Farm. For years, indeed, ever since the farm was purchased by the father of the present owner, it has never been without a sufficient number of cattle and hogs to consume the feed produced, and this farm is producing more today than it ever did. Since 1876 pure bred Shorthorns have been a fixture on the farm. It was in that year that the first purchase was made, and let it be known that the first Shorthorns were good ones and since that time nothing but good ones have found a home at Peabody.

At present Messrs. King are offering seven head of yearling bulls, some straight Scotch, and some Scotch topped, that are just right to go out and do the buyer a world of good. These youngsters have been handled well and are big, strong, lusty fellows. Besides these yearling bulls there are a number of younger ones offered. About eleven head of extra nice heifers and several good young cows are also for sale. All of this stuff is the Peabody kind, which is another way of saying that it is good. The prices are very reasonable. Here is a chance to start in the pure bred cattle business with a comparatively small outlay of cash and the buyer is bound to make some money.

Mr. King would be glad to have a prospective buyer come and look over his herd.

Taylor's Champion Durocs.

Chas. L. Taylor, of Olean, Mo., writes that he is having exceptionally good luck this spring in saving his crop of pigs and that his sows are farrowing large, uniform, thrifty litters. Mr. Taylor has built up a very high class herd by using as good blood as he could find and then taking care of it. He was particularly fortunate in selecting Col. Wonder for a herd boar. From his first show as a junior yearling his record has been a series of winnings that attracted much favorable comment, and if further proof is wanted as to his bid for fame one has only to learn that a daughter of his was made grand champion sow at the Missouri State Fair last year. Anticipating a keen demand for Col. Wonder blood, Mr. Taylor very wisely mated the majority of his brood sows to this great boar and will therefore be in a position to furnish a high class lot of spring boars and gilts to the trade. Orders will be booked now for delivery beginning in June. Mr. Taylor also has on hand quite a number of yearling boars, many of them sired by the champion, that should be out in herds over the state. You will find the prices very reasonable.

Bland Sells Polands September 16th

Halleck Bland, Centralia, Mo., claims September 16th, as the date of his first public sale of Poland Chinas. At that time Mr. Bland plans to offer a very high class lot of boars and gilts.

Hazel Dawn, the 810-pound Duroc sow, owned by A. C. Brockman, Centralia, Mo. Hazel Dawn is one of the largest Duroc sows in the state. She is the dam of several spring boars and gilts offered for sale.

CLYDESDALE HORSES FOR SALE

MISSOURI FARMERS, DO YOU RECOGNIZE THE OPPORTUNITY?

The war in Europe means that the United States will furnish the Draft Horses and Draft Breeding Stock for the world for years to come. There was never a better time for you to get into the game and Missouri farmers should take advantage of the opportunity. Edgar Dooley Etterville, Mo.

RAUSCHER'S CHESTER WHITES!

One of the Oldest Herds In the West

A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.

H. Rauscher & Son, Kahoka, Mo.

Maple Grove O. I. C's

Over 100 spring pigs from 2 to 3 months old at the following prices: Choice of litter, $12; litter average, $10; fall gilts, $15. Bred gilts $20 to $25. Bred sows, $30 to $35. Prize winning blood and the most popular strains. Each individual guaranteed to give satisfaction.

F. J. GREINER, BILLINGS, MO.

Megown's Spotted Polands

B. B. Megown, who advertises Spotted Polands in this paper, has a nice lot of spring pigs coming on that are going to be very attractive by fall. Mr. Megown believes that the Spotted Poland is the most profitable hog for the farmer, and he would like the chance to prove to any prospective buyer that the kind he raises are as good as can be found. Write him and kindly mention this paper.

White's Durocs

In a recent letter from A. White, Jr., Palmyra, Mo., he says: "I have ninety-four spring pigs now and have six more sows to farrow. Trade has been exceptionally good with me for bred sows and gilts but I still have a number of extra good ones left that are bred to farrow the last of this month. Select Col. II, the boar I bought at C. C. Boyd's sale is doing fine in his new home and I like him better every day. Indeed, I think I have in him one of the greatest boars of the breed. I don't know of a larger boar and certainly none are any nearer the desired type than Select Col. II. When I mate him to such sows as Missouri Lady, Lady Olean, and others I could name, I am going to look for championship material in every litter." Mr. White is one breeder that has the courage of his convictions and when he makes up his mind that a particular sow or boar is needed in his herd he usually buys or the other fellow goes home with a high priced hog.

Adenhill's Durocs

R. L. Hill, owner of the Adenhill herd of Durocs, still has several extra good fall boars for sale. These boars are sired by Col. Wonder II, the prize winning son of the champion Col. Wonder, and are out of sows carrying the most popular blood of the breed. Mr. Hill has a large crop of spring pigs coming on and is therefore anxious to move these boars as soon as possible, accordingly he is pricing them extremely reasonable.

Wm. H. Bruns & Sons, Concordia, Mo., offer the readers of The Missouri Farmer excellent values in Jersey bulls of serviceable age, and heifers from high producing dams.

IDLEWILD SHORTHORN CATTLE

Milk and Beef Type. Dual purpose in name and in fact. Herd 50 years old. In one family, on one farm. The type is fixed. I have a strain that I believe rivals the famous Duchesses. Fine beef cattle that are heavy milkers. And deep milkers of fine beef type. Call, or this blood is safe by order.

W. P. Harned, Vermont, Mo.

Shorthorn Bulls and Heifers

PEABODY FARM now offers 12 choice young bulls and 20 heifers. Good individuals; reds and roans. Priced to sell. Also 20 open BERKSHIRE gilts. Get our prices.

June K. King & Son Marshall, Mo.

GALLOWAY CATTLE

Young stock for sale at all times. Herd established 25 years.

J. & W. R. CLELLAND, New Hampton, Mo.

ChoiceAberdeen-Angus

Established 30 years. 100 head in herd. We are offering good useful Bulls, and Heifers of excellent individual merit and breeding. Prices reasonable. Our customers make them popular.

D. L. Sutherland & Sons Windsor, Mo.

Aberdeen-Angus

I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.

J. D. Blackwell Fayette, Mo.

ANGUS CATTLE

HERD FOUNDED 1904

Seven early calves—3 BULLS and 4 HEIFERS, sired by Dean's Eric 139686. Every one the right kind, and priced to sell.

V. E. LAWRENCE, SALISBURY, MO.

Angus Bargains

Registered bulls and heifers. The market topping kind. Leading families represented. Priced worth the money and satisfaction guaranteed.

Also Poland China hogs.

J. M. JONES, R. F. D. 3, EVERTON, MO.

Weller's Duroc Bargains

J. E. Weller, Faucett, Mo., whose ad has appeared in The Missouri Farmer since February 1st, reports a number of sales made through this paper. In the last six weeks stock from his Legal Tender herd has been shipped to the following points: Appleton City, Langdon, Malden, Westboro, Maryville, Clark and DeKalb. Mr. Weller still has for sale a limited number of choice bred gilts and a corking good bunch of boars that he is pricing way down the line. This stock was all immuned last year with the double treatment, and is the sort that will please our readers.

Breeding stock from this herd has been shipped into fifty counties in Missouri, and for a number of years a nice trade has been carried on with old customers, testifying that the kind Mr. Weller is producing give satisfaction. If you are in the market for Durocs don't overlook the Weller herd. Take special advantage of the prices he is quoting for May and write him for further particulars.

Holstein Bulls and Cows

M. E. Moore & Co. have several very choice young bulls and heifers to offer the trade. This herd is one of the oldest in the middle west and for years it has been maintained on a production basis. At present over eighty per cent of the cows have A. R. O. records and this young stuff referred to in the advertisement is backed up by these official records.

Augus Bulls and Heifers

J. D. Blackwell, Fayette, Mo., reports the sale of two young bulls to customers at Poplar Bluff, Mo. Mr. Blackwell is breeding a class of Angus that meet with ready sale to the farmers of this state and he is making very attractive prices on young stock of either sex.

Large Yorkshires

Frank Gildow, Jamesport, Mo., is offering a nice lot of Large Yorkshire boars and gilts. The Yorkshire is the acknowledged bacon hog, and most any farmer can well afford to own a sow and boar just to furnish a supply of bacon for the family.

POLAND CHINA BRED SOWS GET HIGH PRICES

Reports from nine leading auctioneers selling Poland China bred sows during the winter of 1915, show that over 8500 head were sold, with an average of $60 per head.

Two auctioneers gave reports of selling 2500 and 2700 head each with averages of $65.50 and $67.80 respectively.

Number of sales called off due to quarantine regulations from the entire nine reports were 22, and called off for other reasons, 20.

MILK SPREADS TUBERCULOSIS

Milk may convey the active agents of some of our transmissible diseases. Cows having tuberculosis of the udder give off tubercle bacilli in the milk. This milk may be sent to a creamery and there be mixed with the milk coming from a large number of herds, which may be free from tuberculosis. All the milk is then contaminated. Hogs are frequently fed on skim milk from creameries, and this may be the reason why so many hogs are condemned by the meat inspectors every year for tuberculosis. During the year 1912 the Bureau of Animal Industry condemned 42,267 hogs and parts of 314,581 other hogs as tuberculous.—H. Preston Hoskins, Assistant Veterinarian, University Farm, St. Paul.

A HISTORY OF HEREFORDS FREE

The American Hereford Cattle Breeders' Association has just issued a 40-page booklet entitled "Herefords: A Short Story of Their Early History." Numerous requests have been received by the association from breeders, instructors and students in agricultural colleges, public school teachers, county agents and farm demonstrators for a condensed history of the Hereford breed, and this booklet was prepared to meet these requests. In addition to a history of the breed from its origin until it was firmly established in this country, the booklet contains the chapter on Herefords from Farmers' Bulletin No. 612, recently issued by the U. S. Department of Agriculture; a review of the four-year breeding and feeding experiment with the beef breeds conducted by the Kansas Experiment Station at Ft. Hays; and the Official Score Card for Herefords adopted by the association. Copies of the booklet will be sent free on application to the American Hereford Cattle Breeders' Association, 1009 Baltimore Ave., Kansas City, Mo.

POLLED HEREFORDS

The Polled Hereford breeders are making considerable progress in getting their breed established on a good basis. Last year there were nearly 1200 cattle recorded in the association's Herdbook. About 400 new herds have been established making 1277 herds. Iowa leads in the number of herds, 352, and Missouri has 106 herds. J. E. Green, Munice, Ind., is president of the Polled Hereford Breeders' Association and B. O. Gammon, DesMoines, Iowa, is secretary-treasurer. Literature concerning the breed can be had from the secretary.

THE OX WARBLE

This species has been known for more than a hundred years as one of our most injurious animal parasites, especially those working upon cattle, and yet but very little is known about it by the general farmer and stockraiser.

The losses caused by this insect each year aggregate millions of dollars. Not only is the hide of the infested animal punctured by the emerging larvae, causing a reduction in value of one-third, but the presence of the grubs in the animal's back is a source of loss which can not be neglected. The latter is very often overlooked. The poor condition of the animal, its inability to take on flesh, or poor showing at the milk pail, are factors attributed to other causes. Most uninformed cattlemen attribute these conditions to poor care, lack of proper nourishment, or physiological troubles. The presence of fifty or sixty burning, running ulcers on the back of the animal seems a matter of small importance, and is considered lightly by most people. But, Mr. Farmer, how much would you accomplish if you had fifty or sixty boils on your back? The two conditions are analogous and conductive to the same results.

The insect causing all of this trouble is one resembling, in the adult stage, the horse bot fly, or as is sometimes called ,the "nit" fly, but somewhat larger. The adult is seldom seen about the cattle. It is timid and appears only when everything is quiet. The eggs are deposited upon the hairs during the spring and summer, and the animal, upon licking them, carries the egg or larva into its mouth. The young maggot passes into the gullet. From the gullet it migrates slowly through the tissues toward the back. It arrives beneath the skin, and a lump or excrescence begins to appear about mid-winter. This lump gradually grows larger until the middle or latter part of April, when the full-grown grub, which caused the lump, emerges through a hole cut in the hide some time previous, and falls to the ground. It then burrows into the ground and transforms to a pupa, and the adult, two-winged fly, appears from three to six weeks later. This completes the life cycle, which occupies about one year.

There is a prevalent, erroneous notion that the eggs of this warble are laid upon the back of the animal, and the larvae bore beneath the skin to develop. There is no definite proof that such is the case. Also, the large, black horse fly, often seen on the backs of horses and cows, is not, as is often supposed, the parent of this grub. They are separate and distinct species and quite different in habits. These are smaller and more hairy than the large horse flies.

This is one of the easiest insect pests to control that we have. In the winter and early spring, all the insects are in the larval stage in the backs of the cattle. If every one owning cattle would squeeze the grubs from the backs of his animals, and destroy them, there would be no nucleus for a new generation, and consequently, no ox warbles the next year.

When the grub "ripens," i. e., when it matures, a large hole appears in the lump, bordered with pus. This condition usually appears in April and May. When it comes, wrinkle up the hide containing the grub, get the two thumbs and first two fingers on each hand beneath the lump and squeeze. The grub usually flies to the ceiling like a wad from a pop gun; now tramp on it, and the job is completed.

J. Troop,
Entomologist, Indiana Experiment Station.

Don't Sell the Young Calf

BLATCHFORD'S CALF MEAL Will Raise It Without Milk

There's big money and little trouble for you in raising your calf the Blatchford way.

You can save all the milk of the cow for market. As soon as the mother cow's milk is ready to sell, the calf is ready for

Blatchford's Calf Meal

—For over a century the Recognized Milk Food for Calves, at One-Fourth the Cost of Milk

IMPORTANT

We want representatives for the Dickey "Tight as a Jug" Glazed-Tile Silo in every community. If you are interested and wish to establish a pleasant, profitable business that will require only some of your spare time, write us for our proposition. The option is yours if you act at once

I Personally Guarantee the Quality of the Material in the Dickey Jug Tight Silo. It is the same high quality as the Dickey Vitrified Salt Glazed Well Pipe and the Dickey Vitrified Salt Glazed Sanitary Sewer Pipe that I have been manufacturing in Missouri for 30 years.

Walter S. Dickey

Buy a Dickey Jug Tight Vitrified Salt Glazed Tile Silo Now — Pay December 1st

The Dickey "Tight as a Jug" Silo is made of Vitrified Salt Glazed Radial Clay Blocks, each having 4 walls and 3 dead air spaces. The clay is thoroughly vitrified, hard as flint, and each block is salt glazed which gives it a glass-like surface both inside and out. The 4 walls and 3 dead air spaces guarantee you three times the protection of the ordinary silo against extreme heat and cold, compel a perfect and even temperature to every part of the silo area, and insure fresh, crisp, juicy silage regardless of season or conditions.

The Dickey Silo is air-tight, water-tight, storm-proof, acid-proof, gas proof and leak-proof. It won't warp; it won't twist; it won't crumble; it won't decay. The smooth glass-like surface inside causes the silage to settle even and solid and thereby eliminates mold, rotten spots and bad layers.

Once up the **Dickey Silo** stays up and in perfect condition. It requires no painting, guy wires or supports and will last a lifetime. First cost is last cost, which makes it the least expensive as well as the best silo possible to erect.

MAIN WALL OR CHANNEL BLOCK

DOOR JAMB BLOCK

WE CANNOT OVERSTATE THE ADVANTAGE TO YOU OF THE THOROUGH AND COMPLETE VITRIFICATION AND SALT-GLAZE OF THE DICKEY JUG TIGHT SILO. WE COULD SELL THEM CHEAPER IF THEY WERE MERELY HARD BURNED, BUT THEY WOULD NOT BE GOOD ENOUGH FOR YOUR FARM.

Buy your **Dickey "Tight as a Jug" Glazed Tile Silo** now. You can pay for it next December if you wish, or save 12% per annum by paying cash. Build your silo now and have it ready when your crop is ready for your silo. Have it ready for such emergencies as hot winds, backward seasons, drouths, etc. Order and build now while you have the time. Remember you do not have to pay until December.

SEND US A POSTAL OR MAIL COUPON TODAY FOR YOUR FREE CATALOGUE

If you expect to build a silo this year you owe it to yourself to investigate the Dickey "Tight as a Jug" Silo. The catalogue which we will send you not only tells the story far better than we can tell it in this advertisement, but it tells you what those who have used it say about it.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE AND THE MISSOURI EXPERIMENTAL STATION

Over There and Here

We believe there are few, if any spots n Missouri which are better barometers of how the farmers of this state feel than the office of The Missouri Farmer. If something is wrong with the wheat up in Carroll, if the peaches are in a bad way down in Oregon, if the pigs are sick up in Scotland, if high water is playing havoc down in Mississippi, or if the corn-root louse is off the reservation up in Nodaway—in a few hours the word comes vibrating into this office and it is no exaggeration to say that those who perform its daily tasks are elated or despondent in proportion as the news is good or bad—for while they are bent down over their desks early and late, getting ready for the "next paper," their hearts and thoughts are out in the myriad corn and wheat fields which stretch from Iowa to Arkansas and from the Father of Waters on the East to where the wild sunflowers wave in the breeze across the Kansas border.

And thus it is that these beautiful May days find us up in the "crow's nest" anxiously scanning the horizon. That just now we are a bit nervous there is no denying—for here we know what a crop failure means. We have not forgotten the pitiless sun and the onslaught of insects which, during the last several years, have played sad havoc with many a good farmer's dreams. Here we realize that once more the farmer is steering his "good ship" amid the reefs of drouth and pestilence and that upon whether he safely reaches port with a bounteous cargo depends the happiness of thousands of farm homes and bread and raiment for the toiling millions of the city.

But, after all, let us not borrow trouble. Let us not weep until fate has dealt the last card. Let us thank the good God on high that we and our loved ones are healthy in mind and body and that we are at peace with our neighbors and with the World. The Hessian fly is sapping the vitality out of your wheat, you say? Yes, I know it's hard—but maybe you will have a half or two-thirds crop and isn't that a thousand fold better than if every blade of it had been trampled into the Earth and if your fields, like those of Belgium and France and Poland had been dug full of trenches and dotted with rude crosses—marking the last resting place of a lot of stalwart men who have fallen before the cannon's wrath? You are afraid of an "invasion" of chinch bugs? Well, maybe old Jupiter Pluvius has something up his sleeve we don't know about. Maybe he intends sending them on a long voyage down the Mississippi river. And, even though it is decreed that the chinch bugs shall come, wouldn't such an invasion be preferable a thousand times to the kind which is now holding the sad fields of Europe in its merciless grip?—armed hosts which stretch away as far as the eye can see—which trample into the dust every sprig of grass and green thing in their paths—whose great engines of war clang and crunch by day and by night—an invasion whose crimson trail will be in evidence when the Earth is rolled into a scroll and there is an end of time!

For aught we know now, the year may be good or bad. Except for insects here and there, things never looked better. If the beauty of Missouri could be transferred to canvas at this moment, it would produce a picture worthy of the greatest master who ever wielded a painter's brush. So let's not cry until we are hurt. Maybe there are golden harvests just a little way ahead. But, in any event—come what may and let fickle nature play what caprice she will, should not you and I thank the Master from the bottom of our hearts that peace reigns in your humble home and mine? Down in the woodland the quail and the thrush shout for joy and their melody is not disturbed by the sullen roar of distant guns. No cannon's smoke obscures the kindly sun or makes the Earth tremble from its anger. Out in the quiet pasture the lambs frisk and play while the rooster—supreme egotist of the barnyard—struts with accustomed insolence and pride. The patient old work horses are pulling plows and cultivators instead of ugly transport wagons—and, as our little families gather around the frugal supper table there are no stifled sobs for a father, son, brother or sweetheart who sleeps beneath a rude wooden cross on some distant battlefield.

MISSOURI LIVE STOCK AT THE PANAMA EXPOSITION

The Missouri Commission to the Panama-Pacific Exposition has set aside twenty thousand ($20,000) dollars to be used in encouraging and assisting in the exhibition of Missouri live stock at the Panama-Pacific Exposition.

With this liberal state aid this Exposition should furnish an opportunity not frequently had by Missouri live stock breeders. Attention may well be called to the following which are a few of the advantages to be derived from an exhibition at this great world competition and display:

Missouri breeders can compete:

1. For $175,000 in premiums offered by the Panama-Pacific Exposition. Over $125,000 in premiums offered by breed associations and where they they can receive a portion of the $20,000 set aside by the Missiouri Commission for assisting live stock breeders who exhibit at the Exposition.
2. Before vast throngs of people among whom will be a large number of prospective live stock buyers.
3. In a territory which is at the dawn of a great period of live stock production.
4. At a time when live stock production, as a means of food supply and source of labor and pleasure animals, is receiving more attention than ever before and when numbers handled, prices received and net profits resulting are more satisfactory than ever before.
5. At a period when live stock farming has been conceded to be the most satisfactory system of permanent agriculture practice on the average form.

For the distribution of the appropriation for the benefit of the live stock interests the Missouri Commission plans to pay on all worthy Missouri owned animals exhibited in breeding classes and mules a definite sum, the amount of which for the various classes of animals appears below:

Cattle (over 12 months of age)	$12.00
Cattle (over 3 months and less than 12 months of age	8.00
Horses (breeding) over 12 months old. (Shetlands excluded	14.00
Horses (breeding classes) over 6 and less than 12 months not including Shetlands	7.00
Shetland ponies (over 6 months of age)	7.00
Jack stock and mules (over 12 months of age)	14.00
Jack stock and mules (over 3 and less than 12 months)	7.00
Hogs (over 6 months of age)	6.00
Pigs (over 2 months and less than 6 months of age)	3.00
Sheep and goats (over 6 months of age)	5.00
Lambs and kids (over 3 months and less than 6 months)	2.50

From its appropriation set aside for this purpose the Commission plans to duplicate all prizes offered by the Exposition which are won in breeding classes and on mules by Missouri owned and exhibited animals. Should this sum be insufficient to duplicate premiums won, the money will be prorated among the exhibitors in accordance with the amount of money won.

In order to care for the poultry interests the Missouri Commission has arranged to pay the transportation charges of a carload of our choicest poultry to and from the Exposition. They have also agreed to send a poultry expert along with the car to see that the poultry is kept in proper condition, that it is watered and fed, properly cared for, and exhibited in the best possible manner and then returned to the owners. The poultry will be assembled at Kansas City and there passed on by a competent judge. The birds worthy of being sent from Missouri will be included in the car and all transportation charges will be paid from that point to the Exposition and return. All that Missouri exhibitors will be required to pay will be their entry fee and the express to Kansas City and return. With this liberal offer on the part of the Commissioners, hundreds of fine fowls should be sent to represent Missouri in this World's Poultry Show.

The dates of the live stock competition at the Panama-Pacific International Exposition have been set as follows and are listed in the official premium list of the Exposition,

Horses, mules and asses—Thursday, Sept. 30 to Wednesday, Oct. 13.
Cattle, beef and dairy—Monday, Oct. 18 to Nov. 1.
Sheep, goats and swine—Wednesday, Nov. 3 to Monday, Nov. 15.
Carlots of live stock—Thursday, Nov. 11 to Sunday, Nov. 14.
Poultry and pigeons—Thursday, Nov. 18 to Sunday, Nov. 28.
Dogs, cats, pet stock—Monday, Nov. 29 to Wednesday, Dec. 1.
Children's pets—Wednesday, Dec. 1, to Friday, Dec. 3.

The official prize list of the Exposition has been issued. It contains the complete prize list offered by the Exposition, breed associations and statement of the state aid for most states. Besides this it includes "Rules and Regulations" regarding shipping, feed, exhibition, selling and such other information as a prospective exhibitor would desire.

The Missouri Commission has issued a pamphlet covering its activities in the live stock and poultry division. Copies of these have been sent to over two hundred breeders and to all of the country papers in Missouri. Those in charge will be more than pleased to be of any service possible to prospective exhibitors or visitors at the Exposition. Such parties will make possible greater service to them by writing to the below named individuals. Persons desiring a copy of the Missouri pamphlet or information regarding Missouri live stock at the Panama-Pacific Exposition can secure any service which can be rendered by writing.

W. A. Dallmeyer, Jefferson City, Commissioner in charge of Live Stock, or
E. A. Trowbridge, Columbia, Supt. of Missouri Live Stock for the Missouri Commission.

IT SAVES THE FARMER'S THRESH BILL

The Red River Special saves enough extra grain to pay the thresh bill. It saves the bushels that poor threshers pour into the straw pile. Compared with ordinary threshers, the threshing costs the farmer *nothing!*

BUY OR HIRE A

RED RIVER SPECIAL

And Save the Farmer's Thresh Bill

Built on an entirely different principle of separation from other makes. It *beats* the grain out just as you would by hand with a pitchfork—instead of *expecting* it to drop out.

Protect your profits this season by selecting a Red River Special Thresher. It makes more money for the thresherman and saves the farmer's thresh bill.

MORE BUSINESS FOR THRESHERMEN

The thresherman owning a Red River Special can work faster—save grain—save time—save money—*hold* his customers—because of its superior quality.

Send for new Red River Special Paper, FREE

NICHOLS & SHEPARD CO.
(In continuous business since 1848)
Builders of Red River Special Threshers, Wind Stackers, Feeders, Steam Traction Engines and Oil-Gas Tractors
(12) BATTLE CREEK, MICH.

POWER

Economical, reliable, steady, satisfactory engine service built into every Galloway gasoline and kerosene engine. Heavy weight, large bore and long stroke low speeded. Compare it with any engine! Then decide! Don't buy an engine of any make at any price until you know all about Galloway engines. H-6

17.95 1½ h.p.

ENGINE PRICES LOWER

Great volume, perfected design and simplicity make Galloway prices possible. Built from best material on modern automatic machinery, all parts standardized. Sold to you at one small profit. No unnecessary parts. Built-in quality steadily increases our volume. All styles and sizes from 1 1-2 h. p. to 16 h. p. at proportionate prices. A postal gets big Galloway engine book free. Engines shipped from Minneapolis, Council Bluffs, Kansas City, Waterloo or Chicago.

WM. GALLOWAY CO., Box 595 WATERLOO, IOWA

THROUGH THE ALLEGHANIES IN DAYLIGHT

After finishing the campaign for more and better alfalfa in the three northeastern counties of Ohio and around Cleveland, I planned a daylight trip through Pennsylvania, Maryland, Virginia, West Virginia, Kentucky, Indiana and Illinois.

I went from Cleveland to Pittsburg, Pa.—and here I had an opportunity to study one of the greatest steel manufacturing centers in the whole world.

Here the great gigantic furnaces send forth their liquid fire, the flames seem to lap the very sky, day and night—and the roar and din approaches that of Niagara Falls—and the clang and clatter of the ponderous steam hammers reminded me of the deafening sound that greets the ear when going through the stamping mills at Lead, South Dakota.

I said, some years ago, describing the tremendous pandemonium that pervades the air, day and night, at those stamping mills that Gabriel would have some competition when he comes to warn the men who toil amidst those deafening, nerve-racking mills that crush and grind the adamantine rock into finest powder.

I had seen the West when her harvest of wheat and corn was on. Looking over the broad expanse of those western agricultural plains, whose limits seem to have no bounds save the horizon made up of the blue vaulted dome of the azure sky, and watching the innumerable animals of farm and ranch, you ask yourself and others "Who will consume the loaves of bread made from this wide expanse of waving fields of grain, or who will eat or use the pounds of pork and beef and mutton, the products of the rich, fertile soil of the West, the Middle West, the Corn Belt states and the Mississippi Valley, the poultry, the eggs, the potatoes, the countless millions of tons of those things that go to keep soul and body together?" Certainly not the people who dwell on these plains that (like the ancient shepherds on the silver plains of Judea), produce these field crops and feed them to the cattle of a thousand hills, to sheep, to hogs and to poultry—no indeed!

To do this and no more would be to live a narrow selfish life—a life absolutely foreign to these brave and energetic humanitarians that by dint of industry and magnamimity of spirit peopled and subdued the once "wild and wooly" west. But when you travel for miles and more miles through this, the second great range of mountains in the United States (the Appalachian system), the home of the immense beds of iron and coal, and study a country in length and breadth almost if not equal to the food producing section described above, the answer is forthwith and coming, the veil is lifted and the mystery is cleared away.

The products of the farm in an unknown stream passing the products of the mine and factory in an unbroken stream—when you see this with your own eyes you get a clear conception, a fuller and a more complete understanding of what the political economist means when he devotes pages to the great questions of production, consumption, distribution and transportation; why those who labor in the factory and mine are intensely interested in crops and rain and sunshine—the factors essential in producing large yields and plenty—and in turn how those who live upon the land are so deeply concerned as to almost pray without ceasing that the spindles may be kept turning that the fires may not smouler or die out in the furnaces and that the coke ovens may continue to glow and the sky to give off that wierd aspect caused by the lurid flames of the melting pots.

I do not say that it had that effect upon me for that would smack and savor too much of the born "bostes furioso," but to a person of a thoughtful observing turn of mind, after studying the conditions of the agricultural sections, and then inspecting the manufacturing portions of these same United States, it would tend to widen and broaden and deepen his vision and his conception of his own country and magnify his appreciation of that wholesome doctrine that man can not live to himself alone but that those of one section are dependent upon those of another and that the expression the Fatherhood of God and the brotherhood of man was not spoken or written by some idle dreamer but that it is sound teaching and will abide among the children of men until Gabriel sounds the last trumpet and time is no more!

VOLUME VII MAY 15, 1915 NUMBER 10

Why Not High Schools for Farm Boys and Girls?

By Geo. B. Ellis, Managing Editor

Why should the boy and girl who happen to be born in a town be given a better chance to go to a good school than is given to the boy and girl who chance to be born in the country? Is it because townspeople love their children better than do country parents? Oh, no, hardly that. Is it because the man or woman who lives in town really needs more school training to succeed in business and to enjoy life than does the farmer or his wife? I think there are some people who believe that the man who sells plows requires a good education but that it makes little difference about the education of the man who uses that plow, although in the use of the plow the man should know something of the deep and dark mysteries of the soil; of bacterial life and its relation to soil improvement and crop growing; of drainage and the cultivation of the soil to make it give up its plant food; how to protect his crops against the ravages of plant diseases and injurious insects, both of which have caused failure and famine in the past ages and are sure to repeat their processes for ages to come unless men learn how to eradicate or control them; of the feeding of his crops to farm animals in such a way as to get a profit on his labor (the smartest of us have not yet learned how to always do this); of the prevention of live stock diseases which annually cause a loss to farmers of more money than they spend for high schools and good roads. Do you not think that the man who should know something of all these and a thousand other things should be equipped with a better education than the man who merely buys and sells farm implements, coffee and sugar or who stands behind the wicket in the bank and cashes your check or approves your note when you want a loan?

Then who is it so ignorant of the duties of the woman who presides over the farm home that he would say that the responsibilities and duties of the country woman are not as great as—are not much greater than—those of the woman who presides over the home of the merchant, the banker or the professional man? The time has come in the life of this nation and in the development of the world's civilization when just as much attention must be given to the intellectual and spiritual life of country people as is given to city people, or else we must be content to see farmers reduced to the position of the most common laborer like the European peasant. There is no other alternative and it is up to us as intelligent men to say whether we will stand idle while our city brothers in the towns and cities are providing the best high school training for their children, thus giving them a decided advantage over our country boys and girls who have but a very poor elementary school education. This is a serious matter, my friends, and one that concerns the future welfare of our children and perhaps the future welfare of the country. Shall we provide for the proper training of our children, contribute to their ability to earn a competency and enjoy life or shall we for the mere saving of a few dollars of school tax money give to our children and their children cause to say that we failed to look into the future and to see anything beyond our own personal and selfish needs?

Orchestra Wyaconda Consolidated High School. What a refining influence an orchestra like this would have in any school district!

"In Missouri, as far as the rural schools are affected by this problem and its solution, the matter appears very simple," writes W. A. Evans, former State Superintendent of Public Schools. "There should be such schools within reach of the children that they may remain on the farm during the period when they may learn the art of farming and get the necessary cultural preparation for venturing into some other field if preferred. Thousands of parents in the country are now debating what to do about the future education of their children. The children are finishing the country school and four choices are open to the parents: to let the children stop school, to board them in town while going to school, to dispose of the farm and move to town, or to get a school near home.

"It is well known that few of the children who go away from the farm to school ever return and this should be no surprise, as they have not had opportunity to learn the art of farming. This art can be learned between the ages of fourteen and eighteen, and if not learned the young people can not return with reasonable hope of success if they would. On the other hand, it is useless to maintain that all the young people must be kept on the farm, as their vigor, economy, and good blood is needed still and always will be needed in the cities.

"What may be hoped for is to retain a larger portion of the progressive, aggressive young people on the farm with a reasonable hope of success. This may be done by providing high schools within reasonable distance, so that the boys and girls may go to them and remain at home under the care of parents.

The Wyaconda Consolidated High School, a $10,000 building—four years of high school work. The four wagons seen in the picture transport the children over dirt roads without difficulty.

"When all is summed up the remedy is leadership, more money and adequate supervision. Leadership is placed first, as it is the prerequisite of the others. For many people a great charm in country life is the isolation, the imagined independence, and the opportunity for the indulgence of selfishness of individualism. To a great many this is a positive luxury and is indulged freely. To overcome it leaders must arise to convince the farmer that if he wants any of his children to settle around him he must loosen his heartstrings and pocketbook. The lack of money is the root of all evils in the rural schools in spite of the fact that the rural districts in a large part of the state have more wealth per teacher than the towns, and are consequently more able to provide fine, sanitary buildings, good teachers and high school advantages."

The ex-superintendent further writes that while it has been the tendency of rural districts to economize unwisely there are some shining exceptions and these will develop others. Many think it is only a dream to talk about steam-heated and ventilated rooms, indoor toilets, running water, and gas for light and laboratory and other modern and necessary equipment for country schools. But there are a few districts where such progress is a reality.

In Strafford, Green County, only a small village, may be found "a four-room building with a high basement where manual training and domestic science may be taught. The two upper rooms are separated by folding doors forming an auditorium lighted by Blau gas. The basement contains toilets with running water supplied from a deep well, pressure tank and engine. Septic tank disposes of sewage and bubbling fountains on both floors are supplied from the same water supply. The auditorium will provide a community center and the five-acre plot of ground will furnish a community play ground and an agricultural plat to exemplify the studies in agriculture."

One of the most successful examples of what a rural community can do to provide first-class high school facilities for farm boys and girls is the Wyaconda district in Clark County, Northeast Missouri. The village of Wyaconda has a population of about 500 people surrounded by an agricultural community typical of a thousand other similar communities in the state. There are no rock roads but the ordinary dirt road fairly well graded, culverted and kept up with the drag. There are included in the consolidated district the village and the three surrounding school districts. The assessed valuation of the district is only $265,000 and any good farming community in the state can get approximately that much wealth in a district

from 4½ to 5 miles square. The school levy in this district is only one dollar on the hundred of assessed valation which makes a tax of not more than twenty to thirty cents on the hundred of the actual wealth of the district and the rate is about the average of what the towns pay where good high schools are maintained.

There are 230 school children in the district and there were 67 pupils in the high school for the year just closed. The school maintains four

Superintendent M. F. Beach, Wyaconda Consolidated High School

years of high school work with three teachers and four grade teachers making in all seven teachers. The building shown on previous page is fitted up with library and laboratory, etc., and cost $10,000 to build. Agriculture is taught and is a popular subject.

Some have urged as an objection to the enlarged consolidated district the impracticability of getting the children to school in bad weather but the Wyaconda district proves this can be done without difficulty. In any consolidated district a great many of the pupils will live close enough to walk to school and it is only necessary to provide transportation for those living farther away. The greatest hindrance to consolidation is our prejudice against a change, but when a few of these schools are organized and a few years time demonstrates their superiority, then we will see consolidation spread just like other improved conditions have made progress in the past. Without the self-binder today there would be a great shortage in the wheat crop and millions of people who now enjoy white bread on their tables would have to use a coarser substitute. But the introduction of the self-binder was opposed just as violently as the consolidated school is opposed. Near where I lived in 1879, only thirty-six years ago, at least three binders were burned that I knew of because laborers thought the improved machines would take away from them a chance to work. Others opposed the binder because they feared the wire used for binding and left in the straw would kill the cattle and while there was some danger on that score it was soon removed and twine was substituted for wire. And so it will be with the difficulties we now think are in the way of consolidated schools—we will find a way around them. Bad roads, the greatest obstacle in the way, can be gotten rid of without much trouble when we make up our minds to do it.

A well drained dirt road, properly graded, with good culverts and the road drag used when it is needed, will make it possible for one wagon to haul twenty to twenty-five children and get them to school with less exposure and with less tardiness than where the children have to walk. Then, too, roads kept in this fashion will contribute to the better success of the church, the Sunday school, the social clubs and every other activity of farm life. Good roads and good schools will do more than all other things combined to stop the trend to town which has proved disastrous to so many good farmers.

In writing to The Missouri Farmer about the success of the Wyaconda consolidated school, Superintendent Beach says the "school was organized under the Buford Law three years ago. It was not done without strong opposition by some patrons of the rural districts. These kickers offered dozens of reasons for their actions, all of which were ficticious except one—the increased taxation. And though they are spending more money for schools than before no reasonable person will deny that they are getting infinitely more dollar for dollar, than under the old way. In a word they are getting the advantages of an excellent high school, which by reason of the wagons, are brought right to their very gates, at a very reasonable cost. However, the opposition is fast fading away. No one—not even the kickers—would be willing to go back to the old one-room school with its inefficient teacher.

"The school is simply a typical high school like that of any small town. The stranger, unless he should see the wagons, would never suspect that this is a Consolidated School. Transportation has offered no serious difficulties. Not one of the wagons has ever been more than fifteen minutes late. Any community in the state can have as good roads as we have if they will give them a little care.

"It seems to me that the progress of our school proves without a doubt that consolidation is one of the great factors to be considered in uplifting the rural communities of our state."

Another successful consolidated district is in Cooper County, the Prairie Home district. The village population here is only 300, and there is no railroad in the district, which embraces 27

Camp Fire girls Wyaconda consolidated school. A group of girls joined together for some noble work of this kind will wield a good influence on the whole community.

square miles. There are about two hundred children altogether, with twenty-five in the high school. The assessed valuation of the district is $357,000, and the school levy is only 60 cents, which is not above what many one-room school districts now levy to keep up an inferior school. They pay their principal $800 salary and he is the only high school teacher employed. The building cost only $3,000, and a good start on a library has been made, costing $150. The Principal, E. E. Carey, writing to The Missouri Farmer says, "There has been considerable opposition to consolidation, but I think it will abate as the officers understand better how to manage it and the people become accustomed to the new order of things."

A consolidated rural school with a five-acre plot of ground can have plenty of room to conduct some demonstration work in plant propagation but its greatest use will be as a central playground for young and old of the community. Many a boy could be saved from the evil influences of the town pool hall and other evil associations if there was a good playground maintained at the schoolhouse and baseball, football, basket-ball and other health giving sports were encouraged and properly directed.

Suppose we farmers look at this question for our own good and in the interest of our children and if a consolidated school will give our boys and girls equal opportunity with the youth of the city then let us do our duty.

THE SUMMER SILO

A few years ago the prediction was freely made by pioneer silo builders that a silo would soon be considered as necessary as a barn on every Missouri stock farm. While this prophecy has not as yet been fully realized, few farmers now doubt that the time is not far distant when it will be an accomplished fact. Ten years ago the writer found that it was necessary in most parts of the state to explain what was meant by a silo when speaking at farmers' meetings. Five years ago the nature of the silo was generally understood but the farmer was not convinced that he needed one or that it was a practical thing. Now practically every reading and thinking farmer in the state not only knows what a silo is but is convinced that he needs one and if he is not already among the many thousands using one he is only waiting until conditions enable him to build one.

Time was when it did not worry many farmers if forty per cent of the feeding value of the corn cut was lost, as feed was plenty and cheap. Conditions now are different. About two and one-half tons of silage are equal to a ton of timothy hay for feeding purposes. When we consider the price of hay this year it is easy to understand why the silo owner is enthusiastic over his good fortune in having provided a means to preserve all that he raised.

The Summer Silo

The next stage in the development of the silo is now beginning. This is the use of silage for summer feeding. In the past we have depended too much upon grass alone for summer feeding without having any reserve supply of feed for periods of short pasture which come only too often. Almost every year there is a period sometime during the summer when the pastures are short. Young cattle are checked in growth and dairy cattle fall off in milk flow for lack of feed. The man who has a silo filled with good silage to open at this time certainly appreciates it.

Two years ago a farmer built a summer silo at our suggestion and last summer when his neighbors were compelled to sell their stock for lack of feed he was in a position not only to feed his own but to buy theirs. Another farmer, a dairyman of my acquaintance, also had a silo half full of silage and he kept his milk cows up to a good flow all summer with his silage while his neighbors had almost no milk to sell.

The Things to Do

The practical plan is to have two silos on the farms where much stock is kept. One for winter feeding and one, smaller in diameter, for summer feeding. If the season is such that the silage is not needed it can be kept over until the next year or if partially used it can be refilled in the fall. The reason for having a small diameter is that a deeper layer has to be taken off daily during the warm weather to prevent spoiling. For a herd of 20 to 30 animals a silo 14 feet in diameter is large enough for winter while for summer one 10 feet would be recommended for the same herd.

Such a provision for feed during times of temporary shortage in feed due to a lack of rainfall will make it possible to keep a large amount of stock and to maintain it in better condition at all times. The few farmers who have been fortunate enough to have silage for summer feeding during the past few years are just as confident now in their prediction that sooner or later most farmers will have summer silos, as the first silo users were that the silo would come into general use for winter feeding.

C. H. Eckles,
Dairy Department,
University of Missouri.

FIGHTING CHINCH BUGS

Since the first of May the chinch bugs have been doing great damage to wheat and other crops in various sections of the wheat belt. Two days inspection in Carroll County has revealed one of the most threatening outbreaks of the pest that has occurred in years in this state. The old bugs were so thick in places, that they were actually sapping the plants over much of the worst infested fields. I have never before seen the old bugs so abundant in the spring. Conditions in Carroll County are no worse than in other counties of central and west-central Missouri. If weather conditions do not help to reduce the young crop of bugs before the first of June much of the infested wheat will be a complete failure.

The old bugs which pass the winter are seldom abundant enough to do much damage to the wheat but their hordes of young, which this year will probably appear and begin work by the 20th of May, are the ones which usually destroy the wheat. For every old bug, which has been injuring the wheat there will be a hundred young ones by the first of June, at work on the wheat if the weather favors the pest. An abundance of rain and especially a heavy dashing rain after the eggs are laid and the young begin to hatch, is about the only hope the farmers have of saving badly infested wheat.

What Can Be Done Where the Wheat Is Already Destroyed?

Where the wheat is so far gone that it will not be worth threshing, the farmers should first look to the complete destruction of the bugs and then to the use of the injured wheat for pasturing or hay. It must be kept in mind that these old bugs have wings and can fly and if they are driven from the wheat before they lay their eggs they may collect in corn or other crops to lay their eggs. As soon as their eggs have been laid and the young bugs begin to appear in the wheat, however, steps can be taken to exterminate the pest. Where there is no clover in the wheat simply turn stock in and by the 25th of May plow under deeply and thoroughly work the ground. This will bury most of the young bugs and with the crop gone those left above ground will soon starve. Cowpeas or similar legumes may be planted at once, since the bugs will not attack such crops, but if corn is planted in the field make sure the bugs are all dead before planting or the crop is sure to be destroyed. Where there is a good stand of clover in wheat fields, which are ruined by the bugs, simply plan to mow the wheat as close as possible about the 20th or 25th of the month. The old bugs will be mostly dead and gone and the young bugs will soon find themselves without food and will either have to migrate or starve. Make sure that they do not migrate to pastures or green crops. They will be small and cannot migrate like the old or more nearly mature bugs, though they may crawl some distance. A barrier for corralling them may be necessary.

The above treatments are for fields which are hopelessly infested, but where the wheat has not suffered much by May 20 it should not be cut or plowed under. By all means think twice before you cut or plow under or pasture wheat, for with wheat at present prices a partial crop will be worth saving; but many fields are already so completely sapped that there is no question about their being worth saving for cutting and threshing.

What Can Be Done Where Wheat Is Less Severely Attacked?

Where the injury is slight, simply depend on rains for improving conditions and harvest the crop or partial crop and be ready to maintain barriers as soon as the wheat is cut or the bugs begin to migrate. It is up to every farmer in the state to see to it that he does not permit bugs to leave his wheat to attack his own or neighbor's corn and to give rise to an abundant fall brood in corn, which will pass the winter and cause the trouble all over again. This can be done if a little thought and effort is given to the maintaining of barriers. In place of simply keeping them from reaching corn by means of barriers between the wheat stubble and corn, the barrier should be run entirely around the wheat field so as to corrall the bugs. Few have wings when the wheat is ripe, but a few days feeding on the first rows of corn or on grasses in meadows or pastures will enable the bugs to mature and get wings, when they fly everywhere.

The dust barriers are most practical and economical, and of these the log and ditch is simplest and best. A furrow should be plowed around wheat fields soon while the ground is moist. Later it may turn dry when a good ditch with dust mulch cannot be made. The moment the bugs begin to move, start the log and keep it going continuously while the bugs move. They are most active from about 9 o'clock in the morning until 5 or 6 in the afternoon and they seldom continue to migrate more than 10 days if food is kept from their reach.

In case of rain dust is out of the question and then a chemical line is necessary. Tar, road-oil, crude carbolic acid, creosote or stock dip are used most. The stock dips are too expensive to use where the cheaper ones can be had, and each infested community should arrange with the county farm adviser, in those counties where farm advisers are employed, or with some local dealer to handle road-oil or tar so it can be had without delay where needed. In fact it might be well for each farmer to order and have on hand plenty of road-oil or tar for use if needed. These materials are not expensive if ordered in quantities for community use.

The chemical is applied after a smooth firm path has been made with a hoe. A cheap pail or powder can with a hole in the bottom, made by driving an eight-penny nail through, is convenient for distributing the material as one walks along the path. A narrow line is sufficient though it must be renewed to keep it fresh so that the bugs will not cross. After a couple of days it is not necessary to renew it so often.

Coal-Oil Emulsion as a Spray

Post-holes are used as traps along the chemical line for reducing the swarms of bugs, and an emulsion of coal-oil can be used for the same purpose or for killing those bugs which get onto the first few rows of corn before the barrier is put in operation. The emulsion is made by thoroughly churning 1 gallon of strong hot suds with 2 gallons of coal-oil, and when the oil is broken add water to make twenty gallons. This is about the best solution for this purpose, as it will not hurt corn or grasses but will kill the bugs.

The spring and summer campaign this year should be carried out so thoroughly, by all Missouri farmers, that the pest will not be able to reappear again next year. This is entirely possible if each one will do his share, but without co-operation an effective campaign against the pest is hopeless.

L. Haseman, Entomologist.

AN ENGINE ON THE BINDER

One of the most interesting uses to which gasoline engines are now being put on many farms is their application to moving machines, such as grain binders, to drive the sickle and elevator, leaving the horses nothing to do but pull the binder.

By the use of such an engine, two horses will handle an 8-foot binder in heavy grain without trouble. It is thus a saver of horseflesh.

Besides saving horses, the engine makes it possible to cut lodged or wet grain, which often cannot be done without it. In lodged grain, if the binder becomes clogged, it is only necessary to slow down the team, and the sickle and elevator will clear themselves, as they keep on going as fast as ever, being driven by the engine.

In a wet field, if the bull-wheel slips, it has no effect on the sickle, consequently it does not get clogged. Many a farmer has saved his crop during a wet season by the use of an engine, when it would have been impossible to cut without it.

Engines used for this purpose are of the light-weight, high-speed, throttle-governed type. Such engines are now being adapted also to a similar use on hay balers and other machines, besides all general farm work.

Another item to be considered in the use of an engine on the binder is that of less wear and tear. The greatest wear on the binder comes from the bull-wheel falling into holes or dead furrows, or when the team jerks ahead, speeding the entire mechanism very suddenly and putting a terrific strain on chains, bearings, castings and reel. With the engine, the power is applied continuously in a smooth steady stream.

Neighborizing the Farmer

One of the most significant facts of our telephone progress is that one-fourth of the 9,000,000 telephones in the Bell System are rural.

In the days when the telephone was merely a "city convenience," the farms of the country were so many separated units, far removed from the centers of population, and isolated by distance and lack of facilities for communication.

But, as the telephone reached out beyond cities and towns, it completely transformed farm life. It created new rural neighborhoods here, there and everywhere.

Stretching to the farthest corners of the states, it brought the remotest villages and isolated places into direct contact with the larger communities.

Today, the American farmer enjoys the same facilities for instant, direct communication as the city dweller. Though distances between farms are reckoned in miles as the crow flies, the telephone brings every one as close as next door. Though it be half a day's journey to the village, the farmer is but a telephone call away.

Aside from its neighborhood value, the telephone keeps the farmer in touch with the city and abreast of the times.

The Bell System has always recognized rural telephone development as an essential factor of Universal Service. It has co-operated with the farmer to achieve this aim.

The result is that the Bell System reaches more places than there are post offices and includes as many rural telephones as there are telephones of all kinds in Great Britain, France and Germany combined.

The Last Shall Be First

The Missouri Farmer:

I have just finished reading the May 1st issue and I want to say that it is a hummer. I take three farm papers—the Wallace's Farmer, the Breeders' Gazette and The Missouri Farmer—and I have been valuing them in that order, but I think I will have to change that order so that "the last shall be first." I am glad that you are giving so much time and space to the Gardner Rural Credit Bill as I think it is of vital importance to the farmers of Missouri, and I know it will be a great help to me if it passes. If you will send me one of the initiative petitions for the purpose of getting this amendment on the ballot I will be glad to circulate it.

E. V. Jewett, Butler, Mo.

The State Board of Agriculture is going to issue a new road bulletin later in the year. One of its features will be a newly revised form of D. Ward King's internationally famous Road Drag Bulletin as brought down to date by Mr. King himself. It will also carry other Missouri features.

OPPORTUNITIES FOR PIGS

There has been much discussion as regards the ability of swine to balance their own ration when a variety of feeds is placed before them. Does the hog have sense sufficient to know what he wants to eat? Can a hog balance his own ration successfully from a physiological standpoint? Is the appetite of swine an indication of their physiological needs? These are live questions and their correct solution should mean much to Iowa swine husbandry.

The forage crop system of summer swine production is most excellent because of one big reason: namely, that the hog has some opportunity to balance his own ration. If the pasture be alfalfa, or rape, or red clover he can eat much or little of it, and in this way vary the proportion of "side-dish" protein which he eats along with the corn which is thrown over the fence to him. If both corn and high protein pasture are supplied at free will then he has even a greater opportunity to make his ration efficient. Of course when the pig runs out on forage he can eat of the soil; this is of advantage in that complex mineral substances are supplied thereby. Of all the systems of "swine production in the summer time" the forage crop system is the most economical under present existing commercial conditions.

"Hogging-Down Corn" is nothing more nor less than a self-feeding system, and a most natural one at that. If the hogs are allowed free access to rape in the corn field, with possibly alfalfa alongside, then the scheme becomes a "Cafeteria" one in that the hogs have a choice of several feeding stuffs. Corn is hogged-down successfully in every corner of Iowa; as a self-feeding scheme hogging-down is a physiologic and economic success.

Many of you believe that swine know more about how much water they should drink than men do, hence you allow it at free will. You have faith in the hog's ability to balance his liquid ration. So, too, many of you supply salt at free will, thinking that this is the best way; and from the experimental data we secured at Ames recently it would seem that your thoughts are about right in this regard. Then again, thousands of feeders place such condiments as these before swine: limestone, cob charcoal, slacked coal, wood ashes, and others; with the faith that pigs will mix these in with their daily diet in much more economical fashion than when these are mixed with the feeds and "doped out" as so much unwelcome hash. Truly the hog does not like hash any more than does the average human layman.

Now it is a peculiar commentary upon the good judgment of feeders that they should have utmost faith in the hog as regards his ability to choose some feeding materials, but yet should hesitate to trust him with grains, usually high priced, such as corn, oats, tankage, meat meal, oil meal, etc.

Man himself is a self-fed animal; this has been true since the average man's earliest recollection. You have made the "Dairy Lunch" or the "Cafeteria" system of eating popular by you patronage simply because it was efficient in adminstering to your needs. You have believed soup to be an appetizer, and uniformly eat it at the beginning of a meal. Science has shown that you are largely right in this. Disregarding expense you prefer the a la carte method to table d' hote because in the former you choose, and in the latter you do not. You do not relish hash even as a side-dish ordinarily, hence why should you expect swine to relish it as the one and only dish?

Surely appretite is governed by the state of the bodily needs. Appetite has been defined as the desire for food based upon the resultant of past experiences. There is much truth in this. Of course we must remember that even though appetite is a reliable guide as regards bodily needs for feed that the hog which manifests it is using as a basis, physiology and not economy. The hog is a physiologist, not an economist, therefore he chooses his feeds regardless of their monetary value.

Eight months, four days old pigs fed in dry lot weighed 316 pounds at Ames last fall. How were they fed? The following feeds were placed before these pigs shortly after they were weaned and when they weighed about 45 pounds on the average:

Shelled corn
Meat meal (60% protein)
Whole oats
Linseed oil meal
Maple wood charcoal
Finely ground limestone (ground rock)
Common rock salt
Water

Three groups of pigs which have been fed according to the "Iowa System of Self-Feeding Swine" show quite clearly the possibility of this method of feeding in dry lot. The recorded figures on these groups are given to you to awaken and arouse you to the fact that the appetite of pigs should be catered to if greatest gains are to be secured. Of course the economy of gains is an important consideration, but nevertheless when we understand clearly that the appetite is a guide as regards the physiologic needs of pigs then we will have a basis upon which to build more economic gains.

A comparison of these three dry lot groups with pigs self-fed corn and salt upon most excellent alfalfa pasture is typically suggestive of the great possibilities which lie in the judicious and economic use of forages for swine. These forage-fed pigs were given all of the corn they could possibly eat, night and day, together with salt at free will on luxuriantly green alfalfa pasture until November 24th; when after a period of 140 days of feeding they were placed in dry lot (the forage being gone) and fed corn in one self-feeder, meat meal in another, with salt continued as before.

The entire record of the "Free Will" dry-fed pigs and the pasture-fed pigs during the 162 days of feeding is presented in the following table:

Prices of Feeds: Corn 40, 50 and 60 cents; whole oats 30, 38 and 45 cents; meat meal $2.50; oil meal, O. P., $1.50; wheat middlings $1.45; charcoal $3; limestone 60 cents; salt $1 a cwt., and alfalfa pasture $10.75 an acre.

GROWING AND FATTENING PIGS OF 45 POUNDS FROM WEANING TO MARKET

July 7 to Dec. 16, 1914—162 Days of Feeding

The Feeds	S. Corn Meat Meal Oats .... Charcoal Limestone Salt	S. Corn Meat Meal Oats Oil Meal ..... Charcoal Limestone Salt	S. Corn Meat Meal Oats Oil Meal Middlings Charcoal Limestone Salt	S. Corn Meat Meal* .... Salt Alfalfa pasture
Av. Final Wt.	288.6	299.3	289.32	288.2
Total Daily Feed Eaten—Lbs.	6.01	6.55	6.32	5.96
Feed Eaten for a Hundred Pounds Gain:				
S. Corn	361.91	379.62	372.40	391.5
Meat Meal	30.55	25.65	27.57	.....
Oats	6.38	5.17	2.53	4.81
Oil Meal	.....	6.21	1.15	.....
Middlings	.....	.....	14.54	.....
Charcoal	.07	.12	.10	.....
Limestone	.04	.20	.14	.....
Salt	.11	.14	.13	.37
Alfalfa pasture	.....	.....	.....	.0101 acre
Total	399.06	417.12	418.55	396.69 plus pasture .0101 acre
Cost 100-lbs. Gain:				
Corn 40c.	$3.41	$3.50	$3.61	$3.03
Corn 50c.	4.07	4.19	4.28	3.73
Corn 60c.	4.73	4.88	4.95	4.42
Return for a bushel of corn $6 hogs	78.8c	.75.7c	74.9c	81.6

*Last 22 days of 162 day period—finished in Dry Lot. Pasture gone.

The important consideration is, that after all is said and done, the forage fed pigs produced gains at the least cost. When corn costs 60 cents the gains here cost $4.42 a hundred pounds as compared to the cheapest gains produced in dry lots, namely; $4.73, this being where the pigs received corn, meat meal and oats in addition to the mineral feeds. Here is a difference of 31 cents in cost of gain in favor of forage over dry lot methods. Of course the alfalfa was charged at only $10.75 an acre which may be not enough under some local conditions. Where hay is exceptionally high in price a higher cash value is attributed to said alfalfa. However, as much as $41.44 could have been paid for this alfalfa an acre, and still produce gains at the same cost as the best dry lot, or $4.75 a hundred pounds. Really this would mean, therefore, that pasture is superior to dry lot feeding. Under the conditions given alfalfa would be worth for hog feeding $41.41 an acre.

When it comes to the production of gains at the same cost, putting all of the profits upon the corn, hogs selling at $6 we have returns for a bushel ranging from 74.9 cents to 78.8 cents in dry lot as compared to the somewhat greater return of 81.6 cents on the forage of alfalfa,—but in all cases the pigs grew up under the "Iowa System of Self-Feeding Swine."

John M. Evvard,
Iowa Experiment Station.

FARMING THE FARMER

I have been thinking for sometime I would write to The Missouri Farmer and ease my mind a little for fear of it becoming over-charged. Now you know that the teachings of by-gone days were that "any fool could farm" and so I took up with the profession. Since I am many years older than when I was born I have found out that that teaching was false. A successful farmer cannot know too much about his business, but it seems that he is a fool when it comes to being "farmed." This is so apparent that many parents are teaching their children that any fool can farm the farmer and the reason for it is that the farmers are too individualistic, something the farmers seem to be very proud of. They think that as individuals they can stand against the organized strength of other enterprises and under this delusion are robbed of their just share in what they produce.

They take pride in the fact that they are called the back-bone of the nation by the press, but did it occur to those using that word in connection with farmers that it is a very poor figure of speach? Why, just think of calling a lot of scattering bone a back-bone. If the farmers really represented a back-bone they would be strung together on a spinal cord and could say ,'come" and people would come or "go" and the people would go. Were they a combined force like the backbone they could say to the packers who have been causing the farmers to lose money, "Divide up or we will make you look like fifteen cents in an undragged road." Of course it is not intended to convey the idea that the farmers are united when called the back-bone of the earth but just to jolly them up that the term is used. Those who farm the farmer wish to make him swell up with individual pride like a toad under a burrow so that he will not unite with his fellow farmers in demanding a just return for his labor in producing the necessaries of life. They tell the farmer to raise bigger crops but leave him to find out that he gets less money and more work out of a bumper crop than out of a smaller one. The railroads are examples of this class and now we find the papers flooded with advertisements purporting to come from farmers asking a raise in rates.

I think the business of farming the farmer has gone too far and farmers have begun to think for themselves. They are losing some of their individual pride and are becoming more cohesive, looking to the good of all, or in other words, the farmers are beginning to see the need of organized effort and the time is not far distant when it may be possible to farm some of the farmers some of the time but not all the farmers all the time. The Missouri Farmer is right in saying "There is need for the farmers to organize now." The fool farmer will be the one who fails to join a good organization of farmers.

A. W. Sarty,
Moscow Mills, Mo.

Canada is Calling You to her Rich Wheat Lands

She extends to Americans a hearty invitation to settle on her **FREE Homestead lands of 160 acres each** or secure some of the low priced lands in **Manitoba, Saskatchewan and Alberta.**

This year **wheat is higher** but **Canadian land just as cheap,** so the opportunity is more attractive than ever. Canada wants you to help to **feed the world** by tilling some of her soil—**land similar to that** which during many years **has averaged 20 to 45 bushels of wheat to the acre.** Think **what you can make** with wheat around **$1 a bushel** and land so easy to get. Wonderful yields also of **Oats, Barley and Flax. Mixed farming** is fully as **profitable an industry as grain growing.**

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature and particulars as to reduced railway rates to Superintendent Immigration, Ottawa, Canada, or to

GEO. A. COOK,
125 W. 9th St. Kansas City, Mo.
Canadian Government Agent.

SHOULD THE STATE AND FARMERS CO-OPERATE IN SOLVING THE RURAL CREDIT QUESTION?

Written for The Missouri Farmer by Frederick D. Gardner, author of the Missouri State Land Bank Bill.

The press of the United States has been discussing at great length recently the question of rural credit, and particularly the addresses delivered at the Southern Commercial Congress at Muskogee, Okla., a few days ago, by Gov. Myron T. Herrick, of Ohio, and Mr. George Woodruff, president of the Woodruff Trust Co., of Jolet, Ill. Let us discuss the plans of these two gentlemen briefly, together with a brief outline of the Missouri State Land Bank Act passed by the 48th General Assembly, and compare them.

I think it will be shown that Mr. Woodruff's plan would be thoroughly unacceptable to the Trust Companies of the State through whom he says it should be operated. That being true, his plan naturally falls to the ground.

I believe I can show that Mr. Herrick's plan would be unacceptable to the farmers, and hence his plan would fall to the ground. If, therefore, we eliminate these two plans, do we not come back to the principles of the land bank, as embodied in the bill passed by the Legislature?

What is Mr. Woodruff's idea? It does not represent a system of rural credits at all, but merely Mr. Woodruff's own personal idea of how he wishes to lend his own money. I agree that it is a good idea and that if, as stated above, the four large trust companies of St. Louis will do as Mr. Woodruff's Trust Company has done, then state aid would be utterly useless.

Mr. Woodruff's plan is simply this: his Trust Company lends its money to farmers at 6%, divided into 40 semi-annual payments. No commission is charged, and the Trust Company pays all expenses out of the 6%.

Now, after using up his own capital, Mr. Woodruff issues bonds against the loans which he previously made and sells the bonds at 5%. In other words, Mr. Woodruff is content to pay his taxes, all of his running expenses, the cost of collecting the semi-annual payments, the risks of doing business, and the profits for one per cent because if he lends the farmer the money at 6% and sells the bonds at 5% he must take out of this one per cent all kinds of taxes, expenses and profits. He makes a further charge of 2% commission.

Are the Trust Companies of Missouri or of any other state willing to adopt this idea? Mr. Woodruff's example is held up far and near as a demonstration of the fact that private capital is the machinery through which rural credit should be transacted, and not state aid. If that be true, then why have not other Trust Companies in the whole United States followed Mr. Woodruff's example? It does not require any sort of legislation in any state of the Union to do so.

The capital and surplus of the four large Trust Companies of St. Louis is 27 million dollars. According to Mr. Woodruff's idea they should issue 15 dollars of bonds to one of capital, these bonds to be endorsed by the Trust Company and the money loaned to the farmers on 20 years time at 6%. This would mean a total issue of bonds by these four trust companies of 405 millions. This would be quite a help, wouldn't it? What do our four St. Louis trust companies say about it? Can they afford, and will they agree to handle the business on the basis Mr. Woodruff does? If the trust companies themselves say they will not follow his example **then does that not eliminate his idea from further discussion?**

Faults of Herrick's Plan

What is Mr. Herrick's idea? No law is necessary to put his idea into operation. He advocates the co-operative credit societies on the order of the German Landschaft system. He demonstrates his idea by illustrating how it would work in six counties in the State of Kansas. We will transfer the six counties in Kansas to six counties in Missouri.

Every farmer in that district of six counties who wishes to borrow money in that district would join this co-operative society. In order to make the bonds sell at a low rate of interest, every member of the society becomes immediately liable for his unlimited wealth. In other words, the bonds issued by this district would represent the unlimited liability of every farmer in the district who belongs to the organization. Therefore, it would follow that if the bonds are to be made salable at low rates of interest, not only the poor farmers but the wealthy farmers must join the organization.

Now, is the farmer who is worth, we will say, $50,000, and who wishes to borrow $5,000, willing to assume unlimited liability on his remaining $45,000 wealth so that John Jones, located perhaps 75 miles from him, and one may be a German and the other an Italian; or one may be a white man and the other a colored man, may make a loan? I have spoken to hundreds of farmers and not one has said that he would be willing to become responsible to the extent of his unlimited liability for all of the money borrowed in six counties of the state.

In order to make the plan workable, it would be necessry to borrow five million dollars in six counties, and every man who joins that society would assume a liability of 5 million dollars. How Mr. Herrick can imagine that the American farmer would assume this liability under our existing conditions I can not understand. It is true they do this in Germany, but conditions there are different. They are all of one race, one color and one religion. Families have been living there hundreds of years intimately associated in business, religion, etc. Not only that, but they seem to take a different view of the whole proposition, to what we do in America. For instance, Herr Gwinner, President of the Deutsche Bank, told me his family had carried a loan of $5,000 with a co-operative farmers' society for fifty years which he could have paid off any moment, but that he had given this society the benefit of the great wealth of his entire family so that the bonds of the society could be sold at a low rate of interest. Could we expect that to be done in America for at least 100 years to come?

If only the poorer farmers were willing to join the society, which, no doubt, they would be, because if a farmer would figure that if he could borrow through the society an amount equal to his worth, and that his unlimited liability amounted to nothing beyond the money he was borrowing, then what would be the result? The bonds would be unsalable and the whole proposition would fall flat.

The idea carried out by Mr. Woodruff represents what might be termed the private capital idea; and, in my opinion, would be unacceptable to the trust companies who would be expected to handle the business.

The idea advocated by Mr. Herrick represents the co-operative plan, which would be unacceptable to the farmers and to the buyers of bonds.

The Missouri Plan

These two eliminated leave only one other plan, and that is the plan embodied in the Missouri State Land Bank bill as passed by the last Legislature, and which provides for a moderate system of state aid. The bill is not thoroughly understood but really is very simple. It means this: that approaching the subject from the standpoint of the general welfare, and the fact that the cities are over crowded, and that the rural districts are becoming gradually depopulated, and that food supplies are becoming out of all reason in price, that something must be done to finance the farmer on long time at low rates of interest. An emergency, therefore, arises and the state is justified in organizing a corporation known as the Missouri State Land Bank; and in order to start this corporation, the state is justified in making a temporary loan of one million dollars as capital stock, the first $500,000 to be loaned at a fixed rate of 4.3% after, to this 4.3% is added ½ of one per cent to provide for a sinking fund and to care for all expenses; and there should be practically no expense as all the machinery and all work is done by state officials now in the state's employ without further compensation. To this we add 1⅞% on account of principal and we have a total of 6⅓% per annum, which will retire the loan in full in 25 years. (No commission).

Now, after having loaned $500,000 of the original million dollars capital, retaining always $500,000 cash on hand, the bank issues debenture bonds for $500,000 against the $500,000 loans previously made. These bonds are sold wherever money is cheap in any market in the world; and at whatever price is realized for the bonds the money is to be loaned to the farmers at that same rate, plus always ½ of one per cent sinking fund, and enough added to the principal to make the loan amortize or retire itself within the number of years desired by the farmer, the maximum being 25 years.

This ½ of one per cent, it will be noted, will accumulate quite rapidly.

It is provided that at the maturity of the loan whatever amount is left over and above the expenses shall be **returned to the farmer in the shape of a dividend.**

It is provided that bonds may be issued at the rate of 40 to 1 of capital.

It is provided that when the reserve fund has accumlated to a sufficient amount that it will no longer be required that the one million dollar loan is to be returned to the state.

There is no possibility of the plan costing the taxpayer a penny. It would mean bringing millions of dollars of unused capital into the state for developing our great agricultural resources. The money would be spent by the farmers for capital purposes, and, therefore, would in itself become additional security for the loans. This money spent in the rural districts by the farmer would help the merchant in the towns and would help the local banker. It would help all classes of people.

Relating to the question of state aid, I call attention to Mr. Herrick's own statement which is as follows:

"At the inception of land credit institutions on the continent of Europe the tendency of legislation was and still is toward governmental subsidy and control where the borrowers are exclusively farmers or small holders."

I also call your attention to the statements of three other disinterested parties who have perhaps given this question more study than any other men in the United States:

"The function of the State should be somehow to raise these obligations above the credit of a simple farm loan and to give them a large market at a low rate of interest, practically as municipal and state bonds."—F. A. Fetter, Professor of Economics, Princeton University.

"Frankly, my criticisms are all petty details. You are right in principle, when you say that the state must enter this field in order to get something done."—J. F. Ebersole, Professor of Economics, University of Minnesota.

"Long time loans at low rates of interest are an absolute necessity for the American farmer. Private capital does not seem to be willing to undertake this task. The study of the systems in vogue in all nations of the world prove conclusively that it has been a success in the greatest and largest sense where it has been fathered by the state. And my opinion is that it must come to that point, as provided in the modified form outlined in your bill."—C. R. Atkinson, Professor of Economics, Lawrence College, Appleton, Wis.

Portable Engines Proportionally Low.

WITTE Engines

Kerosene, Gasoline and Gas

Stationary, (skidded or on iron base), and Mounted Styles. Standard the world over for 28 years. Better today than ever. Why pay double price for a good engine, or take a poor or doubtful one for any price, when the WITTE costs so little and saves all risk?

5-Year Guaranty

On Efficiency and Durability.

Direct from Factory to Users, for cash or on easy terms, at prices hitherto unheard of, for engines of these merits: Long-wearing, semi-steel, separable cylinders, and four-ring pistons; all vertical valves; automobile ignition; spark shift for easy starting; variable speed; and others, without which no engine can now be high-grade. I am simply sharing my manufacturing advantages with engine buyer-users—asking only one small factory profit.

New Book Free The most easy-to-understand engine book in the business. Gives the "inside" of engine *selling* as well as *manufacturing*. Shows my liberal selling plans with complete price list. Write me your full address for my prompt reply.

Ed. H. Witte, Witte Engine Works, 1841 Oakland Ave., Kansas City, Mo.

The Auto-oiled Aermotor.

The windmill that wears a hat.

With one feed of oil for a year it will toil.

A gentle breeze will whirl it—a gentle pull will furl it.

DUPLICATE GEARS RUNNING IN OIL

Oil Annually

EVERY BEARING FLOODED WITH OIL

This Aermotor is more than great—its gears are balanced in duplicate.

In any breeze it leads with ease.

Oils itself, pumps the water, just exactly as it oughter.

No climbing of towers in ours.

Built to shed the dust and rains. Built to stand the windy strains

With its hat on its head, its oil in its pocket, its a charm to the farm, and no one can knock it.

Aermotor Co., 1146 S. Campbell Ave., Chicago

The Tractor on the Farm

There has been a very marked increased use of tractor power on the farm during the last two years. When the automobile first appeared it was thought it was only a play thing for the rich but today thousands of families in only very moderate circumstances enjoy the use of an automobile. It is estimated that 70,000 automobiles will be registered in Missouri this year. It is our opinion that tractor power for farm work will show the same rapid progress in the next few years. Some men who own threshing outfits have found it profitable to use the same tractor to do plowing for wheat farmers and others who need to hire a great deal of work. The very large farmer of course can afford to own a large size tractor. Several farmers might co-operate and own a tractor together. Then we have the small tractors which cost no more than a four-horse team and will do a great deal more work that are practicable for the medium size farm, and while they are not at work they are not a dead expense like horses are.

THE MISSOURI FARMER

Devoted to Better Farming, Better Farm Homes and Better Citizenship.

Vol. VII May 15, 1915 No. 10

William Hirth - - - Publisher
Geo. B. Ellis - - Managing Editor

Published twice a month, on the 1st and 15th, at Columbia, Mo.

Subscription Price 50 Cents a Year in Advance

The date on the address label gives month and year to which subscription is paid.

Agents Wanted. We want some one to represent us in every community and make up clubs for which we will pay liberal commissions. Write us for terms and sample copies.

We solicit communications from farmers and members of the family on timely and practical subjects. Photographs illustrating farm life or plans for buildings, live stock, etc., are appreciated.

To render service is our aim and we will endeavor to answer all pertinent questions or have them answered by competent authority. When answer is desired direct, always inclose stamp.

Entered at the postoffice at Columbia, Missouri, as second-class mail matter.

THE PEOPLE ARE WAKING UP

We are receiving a number of responses from farmers who see the great need for a better system of farm loans and who offer their services for circulating petitions to put the rural credit amendment on the ballot for the election in 1916. Already we can see some beneficial effects of the campaign we have been making in The Missouri Farmer for cheaper farm loans. We have lately seen some advertisements in our local papers from agents offering money at 5 per cent and while this is due in part to large reserves held in city banks we can not help but believe the principal cause is the general demand for co-operative credit.

Owing to short crops in the southwest part of the grain belt for the last two years there has been a heavy demand by farmers from their local bankers for money to buy feed and other purposes and it is reported that some banks have paid as high as six per cent on deposits. And this condition exists in spite of the fact that there is too much idle money in the big city banks and it is seeking safe channels for investment.

Just as we write these lines we are in receipt of a letter from the author of the Missouri credits law, Col. F. D. Gardner of St. Louis enclosing copy of the following telegram which gives some light on the subject:

(duplicate)

New York City, May 3, 1915.

Banner Buggy Co.,

St. Louis, Mo.

Will discount at once one hundred thousand dollars your paper, three and one-quarter per cent.

(Signed) **E. Naumburg & Co.**

What does this show? It is plain that the wealth created by farmers in growing big crops has been piled up in the cities where it is available for business men and manufacturers at a very low rate of interest. And until the farmers can mobilize their credit so as to make farm loans more attractive they must go on paying a rate of interest fifty to one hundred per cent more than is paid by city borrowers, offering no better security than farm lands.

When the Missouri Land Bank Bill is put into operation these bonds will sell anywhere in the big cities to people who have idle money, there will be money available to drain our wet lands and to clear the timber lands and to buy better live stock to provide better barns, silos and other improvements, and that means the employment of more labor and machinery, all of which are necessary to a prosperous condition of agriculture.

THE OUTLOOK

No one can look into the future and tell what will be the outcome for the season, but a reasonable basis is to figure prospects on the experiences of the past. It is not always safe to count on a bumper yield for a crop which starts out at one hundred and neither will it do to put down as a failure the crop that is started out poorly, but it is at least a safe guess to figure on a better yield for a crop well started than for one poorly started. Diversification of crops has put the country on a much safer basis than it was a good many years ago and especially is this true of Missouri. Back in 1881 the drouth and chinch bugs together destroyed the corn crop and it produced a very serious situation, particularly in newer parts of the state where corn was about the only crop raised. Since that time crops more drouth resistant and immune from bugs have been introduced and it can not be said that our eggs are now all in one basket. It took some very severe lessons like those taught by the drouth years of 1881, 1901 and the more recent ones to demonstrate to farmers the supreme importance of diversification of crops, good cultivation and proper fertilization just like the destruction of cotton in the South by the boll weevil was necessary to teach farmers of that section the danger of a one-crop system. The farmers of Missouri have not all learned the lesson yet but many of them have, as shown by the occasional field of alfalfa and frequent fields of cowpeas and soybeans that may be seen in most any part of the state.

According to the report of the state board of agriculture the wheat outlook on May 1 was considerably above a ten-year average condition. The state report gave the condition of wheat at 90 as compared with an average of 86. The U. S. Government report made one week later estimated the wheat condition in Missouri at 92. Just about this time last year when wheat was showing up very fine, even better than it is now, press reports commenced to circulate telling of losses on wheat of 25 to 75 per cent and for a while it looked like there would be a very poor crop, but the final estimates after harvest showed one of the best crops harvested for many years. The same reports are beginning to come in again and it is evident that about the same area that was infested with Hessian fly last year is being damaged seriously this year. The wheat being so much later this year the fly will have even a better chance to cause loss than last year and some farmers will find it necessary to plow up the wheat and plant corn or some other crop. Another menace which looks worse for the wheat crop this year than last is the chinch bug, which is more numerous than for several years. It is seldom that chinch bugs destroy a crop of wheat entirely and with plenty of rain they may be quite numerous and not injure the wheat greatly, but the situation as it is now demands our best effort to prevent loss.

One factor that will cause most men to hesitate this year before plowing up a wheat crop is the price. If wheat should bring farmers $1.25 a bushel, and there is at least a good chance that it will. a yield of ten bushels will bring the grower about as much per acre as a yield of eighteen bushels did last year at 70 cents a bushel. It is always more or less serious to have to plow up a crop and plant anew, but sometimes it pays. By the first of June it will be apparent what the wheat will do and if it shows by that time that it can not make a paying crop the land can be plowed and put in corn, soybeans, cowpeas, sorghum, kafir, millet or some other crop that will produce feed. If the field plowed up is infested with chinch bugs the plowing should be close and thorough and immediately worked down so as to destroy the bugs. Where planting is done immediately after plowing a bug infested field there is considerable danger of the bugs killing the young corn soon after it comes up, but if the green wheat is turned under closely and the land worked down so every green thing is destroyed, the bugs which do get out of the furrow will have nothing to feed on and will soon die or migrate. So when the plowing can be done a few days before planting there will be little danger from the bugs after the corn is up. This precaution should be taken when planting corn, sorghum, kafir or millet but for cowpeas or soybeans there is no danger for chinch bugs do not live on them.

Corn or other crops planted on wheat ground will be easy to cultivate because of the fine condition of the soil and in normal seasons good crops are grown planted as late as June 15 or 20 and good roughage may be grown planted a month later. It pays to make every acre count.

BREAKING A WORLD'S RECORD

Men who doubt that agriculture is making progress should read the official report of the production of a young Holstein cow which has produced in 365 consecutive days 24,612.8 pounds of milk testing 1,116.05 pounds of butter fat, equivalent to 1302.06 pounds of butter. The cow that has this honor is Finderne Holigen Fayne, registered number 144551, a three-year old cow weighing when the test began about 1200 and had gained 250 pounds in weight when the test was finished. The test is official, having been made under the supervision of the New Jersey Agricultural College. This record is about equal to ten average cows and fully equal to four good dairy cows. If all the cows in Missouri, approximately 800,000, were just one-fourth as efficient as this young Holstein this would be the greatest of all dairy states in the Union.

The making of this world's record was not a mere matter of chance but was the work of science in breeding and feeding. There are thousands of cows kept for dairy purposes which will not produce 200 pounds each of butter annually and according to the census reports there are a great many which produce under 150 pounds. In fact the average farm cow not counting the special dairy breeds will more often come under 100 pounds than otherwise.

The foundation stock will cost a little more to start with well bred stock but why stop for that if it will bring a better profit? Feeding a balanced ration of the best feeds may take a little more study and cost a little more than haphazard methods but if it pays better is it not worth while to do it?

The man who recognizes the fact that the world's knowledge of agriculture is getting a little larger every year and that he must make some effort to get hold of that knowledge if he would keep up with the progress of farming, is the one who stands the best chance to win. We would rather break the world's record by growing the biggest yield of corn or wheat, the finest horse or the largest producing cow than to share in the honor of winning the greatest battle of all history.

ALFALFA FOR EVERY FARM

On May 10 the writer examined a field of alfalfa on Boone County upland soil that looked like it was good for one ton to the acre for the first cutting, and it was about ready to harvest. With normal weather this field will yield three more cuttings, four in all and make a gross return of four tons of dry hay per acre. What other crop will give the farmer a ton of good dry hay by the middle of May and a promise of two or three more crops of equal value? What do you think it would be worth to Missouri if every farm in the state had a small field of alfalfa, say one-tenth the area of the cultivated land? Do you not think it would reduce the anxiety about loss from chinch bugs, Hessian fly, drouth and other crop menaces?

Too many farmers are of the opinion that alfalfa is not suited to their land and just let it go at that without trying to grow it. But a plant that will produce a ton of rich feed, worth nearly as much, pound for pound, as wheat bran and do that by the middle of May and without cultivation is worthy of a thorough trial even though you may fail a few times. There may be a few farms in Missouri where no alfalfa land may be found but comparatively speaking they are few. A crop that affords insurance against drouth, chinch bugs and Hessian fly, in the light of our experience for the last four years is worth a great deal of expense and many trials to get it started.

But alfalfa is not difficult to grow on land in a good state of cultivation and well drained. A few days ago we saw a field showing a fine stand of alfalfa that had been sown on wheat last spring and the alfalfa now shows a growth of several inches and stands good for one or two good cuttings after the wheat is harvested.

For the farmer who has no alfalfa on his farm, now is the time to plan for sowing it. Any field of fallow land or where a crop of small grain is now growing that will be harvested in July or early in August will afford the opportunity for a trial and the man who wants to be on the safe side had better plan to put his farm into the alfalfa class this year.

MAKING MISSOURI KNOWN

We are always ready to give due credit to good work no matter where it may be accomplished, but as a matter of state loyalty we get just a little more pleasure out of it if it is done in Missouri. We know of no institution organized for the study and teaching of poultry husbandry that is doing better work or that is getting more and well deserved praise than is being given the State Poultry Experiment Station at Mountain Grove, Missouri, which is under the efficient supervision of T. E. Quisenberry, a practical Missouri poultryman.

The National Egg-Laying Contest which has been conducted by this station for four years is to be repeated for next year and the fifth annual contest will begin November 1, 1915. The world's record for a two-year old hen is held by "Lady Show You" with 281 egs to her credit for twelve months. We need not go outside Missouri for a great many of the best things to be found and Director Quisenberry is making our poultry superiority known to the world.

BARNYARD GOSSIP

We are very largely creatures of habit and after we have done a thing a certain way for a few times it is pretty hard for us to change the way even though we may think there is a better way. Then habit soon shuts our eyes to investigation and we just take it for granted our way is right and we do not investigate to find out. Take the fellow who in youth gets it into his head that the "signs of the zodiac" will govern plant growth or animal life and he just goes through life believing he is right, in fact he "knows" he is right but he has never made a real investigation to find out. If he should for once plant his potatoes or sow his flax on Good Friday and get a good crop he forever holds that Good Friday is the time, the best, possibly the only time, it is worth while to plant potatoes or sow flax seed. Had he investigated the truth of this or any other old tradition by an earnest effort to find out the truth he might have found out, but he just could not get away from the habit of following tradition and so it goes.

—o—

Too many of us farmers have the corn and wheat habit for our own good. For a long time these have been the leading crops and on some farms nearly the only crops grown, but they are not always the best money crops. The other day I drove through a beautiful hill country along the north bank of the Missouri river, and I saw thousands of acres of this fertile and picturesque land planted to wheat and corn just as it has been for sixty years or more. The chinch bug and Hessian fly were in the wheat and after the wheat is harvested or, may be, destroyed the bugs will take the corn unless there is an unusual amount of rain. Great ditches have been washed in these hillside farms as a result of constant cultivation. The same condition of damage from insects existed last year but the force of habit was so great these farmers followed up the same old methods they have been practicing all their lives and their fathers before them had been in the same rut, and up to this time not one in forty has broken away from the habit of wheat and corn. Here and there is a man who has cut down his grain acreage and has sown some alfalfa or planted an orchard, but it is the rare exception.

—o—

A few years ago one man planted a large apple orchard on some of this same hill land, such as thousands of acres I saw, and the trees were well cared for, pruned and sprayed and the owner has grown rich, while about three out of four of his neighbors, who have stuck to wheat and corn, have made a bare living. A few years ago a half dozen professional men without experience in orcharding, but with enough good business judgment to employ an experienced man to advise them, planted a few thousand apple trees on some of these worn-out hill sides where growing wheat and corn will bring a man in debt half the time, and for their crop of apples last year they received a draft for $16,000 and not all the orchard is bearing. I am told that the sales have already paid for the land and from now on the profits should be greatly increased, or at least when the trees all get into bearing.

—o—

One farmer I know who lives in this belt got out of the wheat and corn habit several years ago and he raised sheep and cattle and sowed alfalfa. Today this man owns his farm, has a good bank account, and his land is not all washed in gulleys. Last spring when so many farmers were hauling hay from the railroad station to keep their poor stock alive until grass grew, this man was selling alfalfa and piling up a bigger bank account. This is just a plain old-fashioned Missouri farmer, but seventy acres of nice alfalfa looked good to him.

—o—

I do not mean to convey the idea that everybody should quit raising grain and go to planting orchards or that every farmer should plant his whole farm in alfalfa, but I do mean that we should get away from doing things just becuse of the habit and try to take up those things that pay. There is a lot of land in Missouri that is not adapted to apple growing at all, but on the other hand, we have some of the finest apple soil in the world, and when this has been demonstrated as above indicated, why do men stick to their old habitual methods? Neither would I advise putting all the wheat and corn land in alfalfa, but when we have hundreds of instances all over the state where farmers have demonstrated the superiority of alfalfa over other forage crops, I can not for the life of me, tell why farmers do not sow more alfalfa.

—o—

Let us shake off this old barnacle, habit and look about us for better methods. Let us take advantage of the experiences and success of our neighbors, or of the farmers of other sections that we may learn about through the farm papers. If a neighbor is milking cows and getting more milk than we do, why not talk it over with him and find out how it is he can beat us? It may be in the kind of cows he keeps, or in the kind of feed they get, or it may be only in the better care he is giving them, but whatever it is, let us find out and get away from our old methods if we are wrong. We believe that just following along in the same old rut is the one cause that is doing farmers more harm than all other things combined. A few farmers are making money and we would like to see all of them doing it, but if they do they must try to follow the methods of the successful ones. Let's get out of our old worn-out habits.

OF INTEREST TO FARMER GIRLS

For every bright and ambitious farmer girl in Missouri who would like to have a beautiful piano all of her own, The Missouri Farmer has a mighty interesting message. We don't ask you to engage in any "contest." Furthermore, the pianos we offer are of the highest quality and beauty. We cannot go into details here. All we will say now is that if you would like to own one of these beautiful instruments all through your own efforts, write to The Missouri Farmer at once. **I appeal to every good housewife who reads this paper to bring this matter to the attention of at least one bright and ambitious farmer girl in her community.**

—The Author of After-Thoughts.

PRACTICAL FARM PAPERS—No. 12

Mention of the Carroll county man who was cutting all the shade trees in his pasture, reminds me, that years ago I took the stand that we waste altogether too much pasture and crop land by allowing shade trees to grow. I know one spreading elm that has in the past fifty years caused the loss of more than a car load of manure, yes, more than three carloads. It is by no means certain that shade trees in a pasture ever added a pound of butter, wool, fat or flesh, to a farm animal, and some of the best herds and flocks I ever saw, were in shadeless pastures. "Whither are we drifting?" Nebraska farmers are claiming that alfalfa roots so deeply, and loosens up the subsoil to such an extent, that future crops of other kinds do not grow well where it has been grown, and the firms that make dynamite claim that it pays to use "canned thunder" to thoroughly break up the subsoil.

H. J. Waters used to say, that there is usually a good safe middle ground between these extremes, and this will apply as well to the soil question as to the controversy in regard to soil toxins, or to their non-existence.

April was the dryest on record, less than one and a half inches of rain falling in the Ohio Valley, but at dusk this May 2, a rain has set in, that looks as if we will get the land soaked now.

Some corn is planted, a few small fields up well, tobacco plants scarcer than in many years, rye heading at two feet high, oats very poor, wheat worse. Buyers have begun to offer $1.25 for new wheat, and I hear that a few sales have been made, but we will not contract ours for a time at least.

Sheep men are discouraged as shearing time draws near and dealers say wool will be lower than in years.

If I was in the sheep business I would borrow money at 8 per cent to hold on to my wool, as it is not a perishable article, easily stored, does not lose in weight, and I think will surely be higher. In some sections of Kentucky the farmers have a wool pool, setting a price on their clip and holding to that price until they get it. They have always succeeded in getting better prices than those who did not pool, and have adopted the same plan with lambs. I imagine that the average wool buyer makes a pretty good profit, even when he buys on his own account, but a great many buy on contract for big firms.

Some forty years ago I bought a little fur, coon, possum, mink and skunk selling to an old fur and wool man of Hebraic genealogy. He told me to buy at just half quoted prices, and from the way he graded my furs down I had to, in order make any money.

Years afterward, the same old fellow wanted me to buy wool for him, and said I could make $25 a day at it, but the offer looked as if it carried trickery with it.

Right here is where we farmers lose out. If wool is worth 16 cents, and a good profit besides, to a dealer, it ought to be worth as much to the farmer, and if 100 sheep men, clipping on an average of 250 pounds each, would get together in selling, they could entirely eliminate the country wool buyer, crooked weights and all, for I have heard of such weights being used.

C. D. Lyon.

The United States Forest Service says of a certain wood:

"It is Hard, Dense, Very Strong, Flexible, Straight and Even in the Grain; a Good, Sound Timber of a Nature Free from Weakening Defects."
Bulletin No. 99, 1911.

What's the answer? What is this wood possessing so many desirable qualities, proved by Government test?

It's Southern Yellow Pine—Nothing Else

"The Wood of a Thousand Uses"—the wood the Forest Service experts found to be the *toughest, strongest, hardest* soft wood, and, in these qualities, *superior to many hard woods.*

Look at this table. The figures are the result of tests by the Forest Service, and show just how much Southern Yellow Pine surpasses hard woods of proverbial strength in its resistance to a crushing weight—that means weight-carrying quality. The figures indicate pounds per square inch.

Long Leaf Yellow Pine	**4,280**	Rock Elm	3,740
White Oak	3,500	Blue Ash	4,180
Hard Maple	3,850	Black Cherry	3,540
Hickory, Big Shellbark	3,890	Hackberry	2,520

ABOUT THE ONLY GOOD QUALITY THE GOVERNMENT DOES *NOT* MENTION IN CONNECTION WITH SOUTHERN YELLOW PINE IS

Low Cost to the User

and your lumber dealer will mention *that* if you ask him.

The Government's purpose in testing the qualities of wood is to aid *you*—assist you in a choice of a wood suited to your needs in building about the farm and in the home. You can depend on the Government's tests; they are accurate and thorough, and made without prejudice. You cannot go wrong in acting on the information provided, and buying the strongest, most durable, easiest worked and most economical wood for all-around farm and home use—

Southern Yellow Pine

Whether you are building a house, barn, silo, feed shed, granary, hog house or water tank, or only replacing a tool handle, you'll find Yellow Pine perfectly and faithfully serves your purpose. And your dealer always has it in stock.

Before you begin that new building on the farm, send to us for plans for barn, granary, poultry house, feed sheds, feedrack, and other farm structures. These plans are FREE, are practical and up-to-date, and include complete specifications.

We have nothing to sell you—we simply want you to learn fully the possibilities in usefulness and money-saving of Southern Yellow Pine.

THE FARM WOMEN OF THE WORLD

Mrs. Bell vanDorn Harbert, president International Congress of Farm Women, Manzanola, Colorado. Abstract of address delivered before Missouri Farm Women in State Meeting at Columbia.

The farm women of the world have been a mighty army coming down through the different stages of civilization, always the burden bearers of the race to which they belonged; the conservers, the builders, content to live and die in isolation if only their sons could arise and take an active part in the world's great work.

They have been unknown and unreckoned with in the social history of the race and as silent as the force of gravity. Their work in bettering humanity has been as unseen as the slow solidification of gravel that the centuries change into rocks.

They have been the sentinels of civilization, forever holding back in God's quiet places the human material that only in the free pure air of the country home could be molded into perfection. Much of this has been the result of instinct rather than philosophy, but it represents the inherent character of the farm women of the world.

On my recent trip through Continental Europe, where I went to study the conditions of farm women in other lands, I invariably found the finger of progress exactly opposite to the mark of refinement and culture reached by the home life of the people.

I found the splendid, stalwart home loving peasant women of Belgium, working and planning how best to raise a family on an income so small that it would seem utterly inadequate to an American mother. In France while I found some splendid farmers, the women seemed dissatisfied, and often looked with longing eyes toward Paris. The girls were leaving the farm for the gayer life in the larger cities. I found old women hitched, with regular yokes, to carts filled with vegetables from their gardens, while a younger girl or boy accompanied the cart to sell its contents.

I saw the women of Italy, bending under jagged bundles of sticks from the vineyards, step aside on the roads, to let the hurrying auto pass; I saw them stooping all day in the lettuce fields of Austria, only stopping long enough to feed and scold and slap the babies who were left under the friendly shade of a tree near by. I saw them eat their black bread and shuffle into the excuse for a home whose blackened walls continued to frown upon them while they slept.

It was different in Servia, the women there are considered the equal of men and while they worked and bravely shared their husbands' poverty yet their faces showed the results of recognition. The silent peasant women of Russia, gleaning the fields as Ruth gleaned them in Bible times, stopping wherever night overtook them and after eating a small measure of the wheat they had gathered and drinking from a brook or a stagnant pool of water nearby they rested on the ground (with no pillow except a bunch of straw and no cover except the fleecy clouds until the dawning of a new day bids them arise and go to work again.

The farm women of Poland seemed to carry a hope in their very countenance, that no matter how hard they had to work under a Russian or German master, there would come a time when they would revive the old civilization and throw off the yoke of their oppressors and their beloved Poland would be free again, and I have often wondered if this awful war would make it possible for Poland's prayers to be answered.

According to my notebook written in Germany, July 25th, 1913, my impression of the German farm women was that they were in the business of raising soldiers, feeding soldiers. Their splendid stalwart sons were sent out to do military duty as freely as their daughters were sent to a school of music and art, and they seemed content to work for food and clothing for both. There was no complaint of taxation which seemed to me to be the greatest burden of the rural people.

In Holland and Denmark the women have the utmost freedom, they often manage their own farms, selling their own produce. Every advantage gained by co-operative buying and selling has been worked out to the smallest detail, and I was surprised to learn that 90% of all co-operative institutions in the world was copied after the little country of Denmark.

It is hardly fair to make any comparison of those farm women of Europe with our own American farm women only as we try to assimilate them into our rural population. They often bring with them a spirit of thrift and a willingness to work that is well worthy of our emulation.

Everywhere I went I found the women looking to America for all that is highest and best, and when I told that great convention of farm women assembled at Ghent, Belgium, that, while we did not inherit titles in America, we were all queens and princesses in our own homes and that it was common for a farm woman to cook and wash and iron and sew for her own household and to be an invited guest at the Governor's ball, they marvelled at the state of American society.

Every country in Europe had some kind of an organization for the rural women but in most countries the emphasis was placed on the **"For."** Ladies of title and wealth had awakened to the need of better conditions in rural districts and were giving large sums of money and spending much time superintending the work for rural betterment. Madam La Baron Resart and Countess T'Kint of Belgium were spending twelve thousand a year for trained nurses, domestic science teachers and traveling schools. Much of the contentment and refinement in the peasant homes of Belgium was due to the excellent work of these two splendid women assisted by that Prince of Agriculture, Hon. Paul De-Vuyst, Director General of Agriculture.

Queen Wilhelmine of Holland gives every support to the agriculture, dairying and poultry raising in her country and the women's agricultural societies seemed to me to be the nearest pattern of our own of any I visited. Women were studying the same problems which interest us and the farm women themselves were carrying on the work. Their organized efforts were by and not for the women on the farm. This was true of the women's co-operative societies in Denmark and I should like to have you visit with me that most wonderful of all schools, The People's High School of Denmark.

The one handicap that the workers in European countries do not have to contend with is distance between farms. Even here in Missouri you can not fully relaize the loneliness of the Western ranches. Imagine the lonely woman in her doorway looking across the straight still prairies watching for a possible speck of animate existence. Organization is for her a dream in the far away future and yet I have found brave pioneer women on these plains who love the silence better than the company of the frivolous women who might come in to break it; women who have chosen the country as the better part, to whom the hills and rivers have called and they have answered, following the vocation of the fields as instinctively as a bird calls to its mate. But these are the exceptions, and most of our isolated women are not content, and when I look over the little unkempt homes all along any of the great railways stretching over the Western plains I feel that the women in those homes are like the wild flowers, crushed by the wheel of necessity.

Pioneer life always falls hardest on the women. The husband often meets his neighbors while in town marketing his crops and attending to the business connected with the farm. The childre attend the district school and find companionship with the children of the neighborhood while the mother stays at home filled with loneliness and often with rebellion. Is it any wonder that she becomes an habitual scold and in many cases a nervous wreck?

Where the distances are not too great much is being done by organization and co-operation to relieve the lonelieness of the women. Social centers, consolidated schools, better roads in rural districts, improved methods of travel, the telephone and the automobile are all doing their part to make farm life more pleasant.

The woman on the plains is becoming acquainted with the woman in the little towns, she feels the bond of sympathy with the women who are less fortunate. The science of being a woman is displaying its wholesome rewards. The farm woman feels instinctively that she is soon to become a recognized citizen of the world, a recognized part of the great economic progress, and after all, the rights and privileges for which women have been struggling to attain, have been granted and woman stands shoulder to shoulder with the man of her choice, she will find that the pleasure of being a home maker and raising a family of strong healthy, happy children is the crowning glory of her life.

During the lecture on "The Farm Women of the World, Mrs. Harbert, showed more than a hundred pictures of farm women of the different countries, taken by her own camera. All classes and conditions of rural homes were vividly portrayed, and after the lecture, every farm woman was glad that her lot was cast in the midst of plenty and in the "Land of the Free."

PETTIS COUNTY HOME-MAKERS

Usually the first question asked about a club or organization is, "What is the object or purpose of the club?" The very name of this club speaks for itself.

We read a great deal about the many similar clubs in Missouri; each striving to better the home life of farm women and to bring about a better understanding between the farm woman and the city woman; each club bringing up and discussing subjects best suited to its locality.

The Pettis County Homemakers have accomplished a great deal since its organization two years ago.

Mrs. Harry Sneed, our president, attributes the success of this club to the fact that she has never had a refusal from any member who has been asked to assist in any way. If you knew our president, as we know her, you could easily understand this loyalty; as president of the State Home Makers' Conference we are especially proud of her and feel that while in this office her wonderful personality will win her many friends and bring about a closer fellowship among the Homemakers' clubs of the State.

The January meeting of the Pettis County Homemakers was a social session, preceding a reception. Miss Mildred Henton, Pettis County's Domestic Science Teacher, gave a cooking demonstration and a detailed outline of the work she is trying to accomplish. Several men interested in the outcome of this work were present, one a farm adviser of Virginia.

A paper, "Poultry Raising," read at the February session, came at a most opportune time and brought forth a full and instructive discussion; many enthusiastic chicken raisers of the country were present and the meeting proved a very profitable one.

The March meeting was a full program. Papers on "Garden Flowers," "Vegetable Gardening and Transplating of Celery Plants" and "Tomato Culture" were read. The keen interest shown by the members proved how desirous they were to learn and help each other.

To return to the purpose of this association, the one big thing accomplished by this band of Pettis County women is the placing and maintaining of a Domestic Science teacher in the rural public schools of the county.

It is not necessary to enumerate the many obstacles that were overcome in accomplishing this, as every new venture brings forth an army of skeptics, However, Miss Henton is busy in this new field, going from school to school in all kinds of weather, teaching our boys and girls cooking, sewing, manual training and many other things in touch with the home and yet not included in the regular curriculum of the home schools. This training will surely fit them to meet life, with ready hands and head.

Only one school in the county has a fully equipped kitchen and manual training room. Some schools have absolutely nothing with which to work, but Miss Henton shows her skill and adaptability by being equal to every emergency or handicap.

In one school she has over fifty pupils to cook for on a one-burner stove, which the Home Makers have furnished her with, also a few of the most essential cooking utensils which she takes in her buggy to the schools having no equipment.

While the girls sew the boys are busy at their manual training and the cooking lesson is given to both boys and girls.

In the cooking lessons, arithmetic, agriculture, history and other regular school studies play an important part, for instance, if tomatoes are to be served, the pupils are called upon to tell all they know of the tomato—its origin, places where it is found, the many plants related to it; and in measuring the ingredients a test in arithmetic is given, thus the old studies are not neglected while entertaining the new ones. Not only the school children are deriving a great benefit from these lessons but the older women of the districts are privileged to attend and learn and many are taking advantage of this opportun-

The Pride of Every Home

There is a McCray refrigerator for the modest home or the most pretentious residence. The SNOW WHITE linings of OPAL GLASS, PORCELAIN or WHITE ENAMEL are not only attractive but are sanitary and easily cleaned.

McCRAY Refrigerators

Keep all foods fresh and palatable—free from taint, germs or odors. The health of your family is safer with a McCray. Write for any of the following catalogs that will tell you why the McCray is best.

ity and show the warmest interest in the lessons.

The program committee of the Pettis County Home Makers always gives us a treat of one or more musical selections, which precede papers on subjects chosen to do the most good to the greatest number, and try to suit the subject to the season of the year and of the most interest to farm women. Meetings are held in Sedalia, that being the most central place, at 2 o'clock the last Saturday of each month. The meetings are adjourned promptly at 4 o'clock, giving the women ample time to do their shopping before returning home.

Many capable women of the city are associated with this organization and we are all working together in harmony and accomplishing good and lasting results.

An invitation is extended to anyone interested and wishing to know more of this work to visit the rural schools of Pettis County and attend our monthly meetings.

Mrs. M. D. Norton,
Rt 1, Sedalia, Mo.

SOUR MILK SAVES CHICKS

One of the main causes of death among chicks is white diarrhea. This is very prevalent and investigations have shown conclusively that the original source is often from parent stock. Many chicks have the disease when hatched, and others contract it from them, through feed and forage in infected litter or grounds. This transmission from chick to chick is common during the first three or four days, and this is the period of great danger, especially among chicks of low vitality.

The symptoms are a whitish discharge from the vent, which results in "pasting up behind." The chicks become listless and sleepy, lose appetite, the feathers become ruffled, breathing labored, and they constantly peep or chirp. They may die suddenly or gradually waste away.

This disease is being most carefully investigated by the Agricultural Experiment Station at Storrs, Connecticut, and the third report of their investigations has been published. This report recommends the feeding of sour milk as the best thing to use for a preventive of this disease. It advocates feeding sour milk from the very first and keeping it before the chicks constantly. The acidity of the milk acts as a germicide. Moreover the milk is an animal product which chicks require in some form and it is a great factor in the growth and vigor of the young flock. Of course the commercial chick feeds now so common are fed and pure water supplied, but in addition sour milk is kept before the chicks constantly, the vessels being cleaned and refilled daily during the first few weeks.

Farmers and poultry raisers should feed sour skim milk constantly, at least after chicks are a few days old, as a preventive of this dread disease, and to stimulate their growth. It also increases egg production in the laying flock. Numerous experiments have demonstrated that skim milk and curds, or cottage cheese, are among the most stimulating feeds for poultry of all kinds, except very young chicks. Many claim that sweet milk is much safer until the chicks are at least a week or ten days old. There is a constant supply on nearly every farm and it should be universally used for the farm flock.—N. E. Chapman, Poultry Specialist, University Farm, St. Paul.

WATERFOWL

Ten years ago the interest in waterfowl was, and had been for some time, decidedly on the decline in this state. If we were to call the roll of Missouri fanciers and breeders very few could be found who had anything in waterfowl ten years ago.

True, some of the farmers' wives had some mongrel geese. From them the housewife stripped the coarse, gray feathers in order to get a bed for John and all the other boys, just as her mother and grandmother had done.

Any woman in those days who would pay a dollar for a pure-blood drake or change the male stock every year was "terrible high notioned," and general sympathy was expressed throughout the community for the husband's finances. So when Missourians began to fancy something nice in waterfowl, and began to appreciate their beauty and earning power, they found it necessary to order stock from other states and were fortunate to find that their sister state of Illinois had flocks of great snowy geese and ducks for reasonable prices, the quality considered. Then came the Standard of Perfection, admitting enough varieties that none of the breeds were overdone, and living prices have prevailed since.

Now, on many farms are found waterfowl, almost beyond price. This field is not at all crowded yet, but it is a very important one. So little is written regarding it as compared with the hen and her product that people are likely to think that this branch of the poultry business is unimportant.

Still waterfowl are much less liable to disease and are much more remunerative. Thus they are rapidly gaining in popular favor. In ten more years many of the chicken cranks will realize where they stand, when hundreds of their breeds are entered at each show and they fail to get marked up, thus losing advertising and many sales. Then their fever rapidly dropping to normal, they will cast about for a field that is not crowded and promptly settle on a yard of ducks or geese.

There are many beautiful breeds not yet tried in Missouri. The Penciled Runner is a thing of beauty. It gives an egg a day for three-fourths of the year. Yet it is questioned if there is a farm of them in extensive numbers in this state. People want something new and when you buy, whether to supply market eggs, green duck flesh or breeding stock, study first the demand of your nearest market. Then get something to fill it, different from the general run in the community. The field is wide and competitors few.

Mrs. Benj. Daelhousen,
Oakwood, Mo.

TIME TO SPRAY APPLE TREES

A correspondent from Lathrop, Missouri submits the following questions:

When is the right time to spray apple trees after they have bloomed?

There have been a lot of little green bugs apparently sapping the leaves on my apple trees. Now they seem to have hatched out a progeny that looks like little flying ants. Are they harmful, and if so, how can I get rid of them?

Answered as follows by Dr. J. C. Whitten of the State University:

It is best to spray apple trees as early as convenient after they drop their blossoms, while the blossom ends of the little setting fruit are open to receive the spray and before the apples begin to turn downward, which makes it more inconvenient to fill the blossom ends with the spray.

For this spraying I would recommend commercial lime sulphur 1½ gallons, arsenate of lead paste 2 pounds (or if you use the dry powdered arsenate of lead, 1 pound) to 48½ gallons of water, making 50 gallons of spray. The lime sulphur is for the purpose of preventing apple scab and other fungous diseases; the arsenate of lead is for the purpose of killing apple worm, curculio and other biting insects.

The green bugs described are undoubtedly the green plant louse or apple leaf aphis. These insects do not usually occur in sufficient numbers or persist for a sufficient length of time to justify a spraying for them. If they occur in sufficient numbers to virtually cover the buds of young leaves at the growing points, and if the weather remains cool, it may in certain seasons be desirable to spray for them, as they suck the juice from the tender growing plants and do some injury. The best spray for them in seasons when it is necessary is a tobacco decoction. The Black Leaf 40 is a good commercial brand of tobacco decoction to use for them. As soon as the spring weather gets warm parasites and predaceous insects hatch out abundantly to pray upon the plant lice and very soon thin them out. The present spring has now gotten warm enough that the parasites and predaceous insects will very rapidly destroy the plant lice and for that reason it is not generally recommended to spray for them this year.

Lady Beetles Are Farmers' Friends

A correspondent from Barton County, R. A. Patterson writes he has observed that lady beetles are often found with chinch bugs and asks what their relation is to the spread of the bugs. Professor Haseman replies as follows:

The lady beetles, as you no doubt know, are among the farmers' most beneficial friends. They feed on the flesh of soft insects and insect eggs. The common green lice furnish most of their food, though some of the lady beetles feed on the eggs of such insects as the potato beetles, chinch bugs, leaf beetles and many other forms. From this you will see that very probably the lady beetles where found associated with the chinch bugs will be found feeding on the chinch bugs, as well as on the young active stages of the chinch bug. When the chinch bug first hatches from the egg it is a very small red object and soon begins to suck sap from the wheat and other plants. You will probably find where the lady beetles are exceedingly abundant that they will help you greatly in the campaign against the pest. It is also very probable that you will find some of the green lice on wheat and corn, and these, of course, will furnish part of the food for the swarms of lady bettles which you have noticed along with the chinch bugs.

Learn Neighborhood Laundering

Every student enrolled in the winter dairy course at the University of Wisconsin is being taught how to operate a community laundry and should the occasion later arise undoubtedly would be in a position to install and operate a similar plant in connection with a local creamery.

In washing their own dairy suits and machine shop overalls the students learn the operation of the laundry machinery used in connection with the creamery. The equipment at the dairy school is suited only for rough drying. As the cost of equipping such a laundering plant is but about $300 it is not beyond the possibilities for any community.

The rough drying of plain material would constitute the bulk of the work for neighborhood laundries, and hence the practice given at the dairy school is of the utmost practical value in furthering the cause of "sunny Mondays" on the farm.

One of the greatest labor-saving conveniences in the farm home is one of the most neglected and that is running water. If every woman knew how cheaply water could be brought into the kitchen and bath room she would not rest until the good man of the house made this improvement, if a pig had to be sacrificed to do it.

"The Quality Goes IN Before the Name Goes ON"

"Let the Company Come

We are prepared to entertain them royally with our new

Crown Combinola

'The Player of Many Tones'

THIS morning I bought some new music rolls and we now have a fine assortment—the latest dance music, popular ballads, marches, semiclassical and classical compositions—enough to please all. Grace can play for us, so that all can enjoy themselves."

You, too, can entertain royally with the Crown Combinola—play your own and your friends' favorite selections every night if you wish. The Crown Combinola brings into your home the finest music ever composed—places at your command the difficult compositions of the masters which few people ever learn to play. It is never out of practice, never too tired to play, never has to be coaxed; gives you all the music you want, of the kind you want, when you want it; and can be played by anyone, even a child.

And in addition to all piano music it faithfully reproduces the tones of the harp, zither, autóharp, harpsichord, clavichord, guitar, mandolin, banjo, and many other stringed instruments, placing a wide range of music at your command.

Your old piano taken in exchange at a liberal allowance. Estimates furnished FREE upon request and with no obligation on your part.

Learn more about this wonderful instrument which brings pleasure and happiness into your home. Our booklet "Music in the Home" explains in detail. Send for it today. Mail the coupon NOW.

CO-OPERATION IN LIVE STOCK BREEDING

Co-operation in the breeding of live stock is a comparatively new undertaking in many sections of the United States. Where it has been adopted, it has been a decided success and offers many opportunities for systematic improvement of live stock. What co-operation has done to make possible a success along other lines it is capable of doing for the live stock breeding industry. There are a number of factors that make co-operation along the line desirable, and all should be carefully considered in starting a movement of this kind. One of the greatest drawbacks to improvement in live stock breeding has been the apparent initial cost of good pure bred stock, the result of which is that many farmers have continued breeding scrubs and have made little or no progress in grading up their herd. This one obstacle is readily overcome by co-operation or community breeding, in that the initial cost of a pure bred sire will be divided among several farmers, all of whom will have the benefit of a good sire.

The success of the live stock industry of England and Scotland has, in a large measure, been due to the co-operative tendency among the breeders and farmers in one locality. Certain counties are noted for the quality and amount of live stock of one kind or another produced and bred along a particular line for many years. These people have worked together and developed one or two breeds in a community and raised it to a high standard of perfection. Such practice has not only made it possible to produce a large amount of high class stock but it has been done at the minimum expense to the breeders.

There are similar communities in the United States where such breeding has been practiced and in each case it has done much to develop a certain class of live stock. Lake Mills, Wisconsin, has become known as one of the greatest Holstein centers of the central west. Buyers go there from all points of the country to buy Holstein cattle. This place, like others, had a small beginning and developed gradually. Certain sections of Ohio have become noted for breeding one breed of beef cattle. Certain other regions have developed either hogs, sheep, or horses.

This system of breeding is not only a great aid in improving the live stock in a locality, but it attracts buyers from a distance who would otherwise not consider coming. When a buyer of pure bred cattle, hogs, sheep, or horses selects a place to visit, with the intention of purchasing a number of animals, he first makes certain that he can visit several breeders, breeding the same kind of stock on the one trip. He is attracted to places where he knows that he can purchase a carload if he so desires. He is willing to pay a higher price for a carload of stock under such conditions as compared to a place where he must spend a considerable amount of time driving about the country and then not securing enough to supply his needs. In such localities he is further assured that much of the stock is bred along similar lines and possesses greater uniformity. These conditions will not only attract the buyers of pure bred live stock, but also the dealers in grade stock will seek such places, because of the presence of high grade animals, when good pure bred sires are used. Co-operation also reduces the cost of advertising as it is possible to advertise as an association and all members receive some benefit.

Farmers in one locality should plan, so far as it is possible, to decide on one or two breeds of dairy cattle, beef cattle, hogs, sheep, or horses, instead of breeding all breeds and not making a success of any. There is not enough difference in the various breeds of live stock to make it impossible for a group of farmers to get together on any one breed.

After the breeds that are to be developed have been decided upon it is important that they are not changed from year to year. Changing of breeds is not conducive to successful breeding when practiced by individuals and less so when done by a group of farmers. Uniformity of type can only be established where the breeding is conducted along one line for a period of years. Keeping to one breed will further have the power of creating greater interest among those who do not belong to the association, but who are watching the results obtained and the improvement made on the grade stock.

The simplest way to organize a co-operative breeding association or club is for one to six farmers to form a club and purchase a pure bred sire. The number of members necessary will depend somewhat upon the number of animals owned that must be bred during the year. It is generally a good plan to get the farmers as near together as possible so that the sire may be kept in the center of the block. This system of breeding can easily be extended beyond a local club and made a town or county organization. It is better to have a number of small clubs held in common by a large organization such as district or county association. This will make it possible to transfer the sire from one block to another every year so as to avoid in-breeding. This will make it possible to keep good sires in a community a longer period of time than where owned by an individual.

When organizing, a constitution and by-laws are adopted in which the general plan of the club and duties of its members are stated. A committee of two or three farmers should be appointed and delegated to purchase the sires and such other animals as are desired for the club. A maximum price to be paid for such animals is agreed upon at the general meeting and each member is taxed pro-rata. The place to keep the sires for each club must be determined by the members. It frequently happens that some member is willing to keep and care for the sire for the privilege of having him on the farm for breeding his stock. Other member should contribute some feed so that the entire cost of keeping will not fall on one person.

The changing of sires from one block to another should be done every two years so as to avoid in-breeding. If there are five sires of one breed in the association they would represent five blocks. The sire of Block No. 1 would be transferred to Block No. 2 and sire from Block No. 5 would come to No. 1. This would establish a rotation so that each sire would be used until he has passed his state of usefulness.

W. H. Tomhave,
Professor of Animal Husbandry, Pennsylvania State College.

Service that serves!

With its own rails reaching all the principal cities in Oklahoma and Texas, the Katy Lines can serve you best, either as a traveler or as a shipper of freight.

I seek the opportunity of serving you and will cheerfully furnish any information desired about rates and service.

W. S. George, G. P. A., St. Louis, Mo.

Seed and Livestock for Sale

The Missouri Farmers' Exchange has unlimited quantities of **Seed** and **Livestock** for sale.

Just now we would be glad to interest more Missouri farmers in growing cowpeas and soybeans from home-grown seed, which our member are offering for sale.

This is the season when some definite work should be done in starting in new lines of live stock breeding. The Exchange is ready to be of service to you in locating livestock for this purpose, and in giving general information to readers of The Missouri Farmer who have questions to ask.

We would have you remember that in dealing with the members of the Exchange you are sure to get a "Square Deal."

Co-operating in this way this spring, we have found a market for thousands of bushels of seed and a considerable quantity of livestock. Practically all of this seed has been raised in Missouri, and has been placed in the hands of Missouri farmers. There is no doubt but that this home grown seed will be of special value to those purchasing it, and we consider that it has done a special service in promoting the production of cowpeas and soy beans. We have made it possible for every farmer wanting cowpea and soy bean seed to locate and secure home-grown seed. With the soy bean this is the first essential to look to if success is to be expected. We feel responsible for securing this first requirement for the many hundreds of farmers who are making their first start in the production of this comparatively new crop with seed secured through the Exchange. Our work with the cowpea and soy bean stands out most prominent.

The Missouri Farmers' Exchange,
Columbia, Mo., P. O. Box 216.

BROODY HENS

This is the time of the year when much attention should be given to the broody hens. They will incubate and spoil any fertile eggs left in the nest over night and are getting farther from a laying condition each day they remain broody.

The question of broodiness and its relation to egg production and the question of the relation of egg production to broodiness have been discussed many times both pro and con. One party says he wants the hen which does not go broody while another thinks it is a sign of a good layer.

Regardless of what we wish in regard to whether hens go broody or not, we are compelled to admit that both egg production and broodiness are parts of Nature's plan to reproduce the fowl, and are therefore very closely related to each other.

In order to give a better idea of the relation of egg production to broodiness, the following table is given. This table is the record made by 1040 hens in the National Contest here at this Station in 1913-1914. The table gives breed records instead of pen or variety. For example, all varieties of Wyandottes are considered together, etc. The table shows the average number of eggs laid by all hens in each breed which went broody a certain number of times. The total average is secured by arranging the averages of each breed.

No. of eggs laid by—	No. of times broody								
	0	1	2	3	4	5	6	7	8
Wyandottes	147	139	165	159	155	171	173	175	152
Orpingtons	127	133	134	135	170	146	160	163	142
Plymouth Rocks	158	155	164	179	149	162	143	163	
Leghorns	154	147	125	156	215	163	165	162	
Rhode Island Reds	153	177	163	156	153	141	144		
Langshans	121	159	100	164	167	150	139		
Anconas	155	148	146	163					
Minorcas	138	176	143	138					
Campines	135								
Averages	143	154	142	156	168	155	154	165	147

By studying the table it would indicate that the best hens lay 168 eggs and go broody four times per year.

It was noted in compiling this table that many of the high laying hens came in the first column, but it was further noted that many low producing hens were in the same class, which brought the average down to the second from the lowest in the list.

The principal point to be noticed here is that it is not a safe rule to select the non-sitters as the best layers.

Looking at it from another point of view, we find all hens that laid less than 100 eggs, averaged going broody once and three-quarters times each, those laying between 100 and 200 eggs, averaged going broody 2½ times each, and all laying over 200 eggs averaged going broody twice each.

Taking the highest laying hen from each pen, the average was 199 eggs each and also averaged going broody 2.2 times each, while the lowest producer from each pen averaged 83 eggs, and went broody 1.8 times each.

There is an idea generally prevalent that when a hen begins to lay that she has a certin number of eggs to lay, after which she goes broody. This idea has been proven incorrect, as the production of eggs has been proven to be an endless chain, which contines according to the ability given the hen by Nature unless it is interrupted or broken by broodiness or some outside influence such as change in weather, location, etc.

From the investigations we have made so far, we are convinced that broodiness is a condition of the brain and not of the body, for at the time the hen goes broody, she is in a laying condition, having the different parts of the egg partly developed, but because of staying on the nest, lack of exercise, loss of appetite, and lack of nourishment, the hen takes the egg material back into her own system and uses it as nourishment just as hens do when a sudden change in weather stops them from laying.

A hen is one of the most jealous creatures on this earth, and if placed in a wire-sided coop where she can see the rest of the flock ranging about the yard, she is very restless, especially if there is a male with the flock frequently calling his mates to partake of a choice morsel of food, and if plenty of food and water are supplied, she eats often, thereby keeping her body built up so she goes to laying again in a short time.

The plan followed here at the Experiment Station is to place the hen in this kind of coop on the day after she remains on the nest and does not lay. She is kept in the coop four days and then released. During the time she is left in the coop, she is given all the feed and water she wants. About 4,000 hens are treated in this way each summer at this place. The records show that hens broken in this way begin laying again as follows:

The time from the laying of the last egg till the hen began laying again was 10 days in March, 8 days in April, 10 days in May, and 12 days in June. There were more broody hens in June than in April, but for practical purposes we might say the average is 10 days.

These coops can be easily built by anyone out of scrap lumber and a little wire.

This point is well worthy the consideration of the producer, not only from the standpoint of production, but from the standpoint of quality of the eggs, for the broody hen is the cause of many spoiled eggs going to market during the summer season.

C. T. Patterson,
State Poultry Experiment Station,

Holstein Bull Calves

A fine lot of very high grade Holstein bull calves out of grand daughters of the famous Missouri cow, Chief Josephine, and sired by a son of the premium state fair cow. These calves are in fine condition ready to ship now at $25 each. This is a rare opportunity to get a bull of the best breeding to improve your milk stock. Better order now as I have had to return money for orders I could not fill.

Rose Comb Rhode Island Reds. Eggs, $1 for 15, $4 for 100. Mrs. Robt. L. Phelps, Musselfolk, Mo. 5151

Houston's Buff Rocks outlay the Leghorns. From Poley's $7,000 stock. 20 eggs $1.50. Sarah Houston, Mercer, Mo.

A Bright Boy, a Wise Father and Bigger Crops

My son, 14 years, was studying Agriculture at the country school. One night he came home from school and asked, "Papa, did you ever have a wheat field that looked pretty good until it was about time for it to get ripe and then the heads would turn white and not fill?"

I had to say "Yes" for that had always been my biggest trouble in growing wheat.

"Well, Papa, the land needs phosphoric acid and potash to make those heads fill well and to cause the wheat to ripen."

I looked at the boy again, for it was a new experience to have my small son tell me how to farm, and before I thought, retorted, "What do you know about it?"

"We had it in our lesson today. That's what the book said," came the quick reply.

By that time I was feeling that it was about time I kept pace with the lad as regards modern agricultural methods, so I told him we would try out some phosphoric acid and potash. Right away, I began to read up on commercial fertilizers with the result that I concluded that a little ammonia would give my wheat a quicker start and enable it to winter better. Since that time, I have been applying 125 pounds per acre of a high-grade fertilizer on wheat on my farm in Kansas and have obtained an average increased yield of 10 bushels per acre. Each year, the fertilized wheat is plump and of the best quality. The fertilization of wheat has paid me well and I expect to continue it.—Albert Cuthbertson, Girard, Kansas.

The Missouri Farmer is offering a beautiful piano to some bright, ambitious farmer girl in every community in Missouri. By putting in your spare time for a few weeks you can easily earn one of these handsome instruments. Please write us for full particulars at once. Delay means that some other girl will get your territory.

Of Interest to Hog Men

Elsewhere in this issue will be found the advertisement of the Rowe Hog Oiler—a device which enables hogs to divest themselves of all kinds of vermin. Look up the advertisement and drop the company a postal card and ask them to send you full particulars. It is a matter worth looknig into. Be sure to mention The Missouri Farmer.

Treatment for Cutworms

Among the familiar pests which the experienced gardener expects to meet this season, if he has not already, are the various kinds of cutworms. One of the remedies suggested by the College of Agriculture is the poisoned bran mash. To make it, mix 20 parts dry bran to one part Paris green; add the juice and chopped pulp and peel of orange or lemon fruits to give perceptible flavor or odor and enough water to make a thoroughly dampened mash. A tablespoonful of the mixture may be placed near the bases of the plants. In the small garden it may often be easier to pick and destroy worms or brush them into a pan of oil and water than to poison them. Clean culture, of course, is important.

How to Dehorn a Calf

Possibly the most satisfactory way to dehorn a calf is to apply caustic potash. Caustic potash can be obtained at almost any drug store. It usually comes in the form of sticks about the size of a lead pencil. The calf should be treated when one or two days old or as soon as the starting horn can be located.

To dehorn the calf, clip the hair from the spot where the horn is starting. Then wet the end of a stick of caustic potash and rub on the budding horn until a soft spot about the size of a dime is produced. The operation can be hastened by breaking the skin before rubbing on the potash. The calf should not be turned out into the rain immediately after caustic potash has been applied, as it may be washed down into the calf's eyes.

Caustic potash should be handled by wrapping a piece of paper around the stick. It must be kept in a tightly stoppered bottle, or it will absorb water from the air and dissolve.—Bulletin 149, Agricultural Experiment Station of Nebraska.

It Spoiled Him

Editor Missouri Farmer,

Dear Sir: The few copies of your paper you sent me while my alfalfa seed ad was running has spoiled me. You will please find one dollar on subscription account. I already take three farm journals, "good ones," and learn from all of them. In fact, I do not know of any investment that will give a farmer the returns that a few dollars in the best farm journals will—at least this has been my experience. Wishing you the best, I am,

S. E. Morey, Piedmont, Okla.

This paper stands for the farmer's interest, always.

Beautiful Post Cards. For 10c I will send you 20 beautiful Post Cards—all kinds and the prettiest you have ever seen. Send at once before they are all gone. Joe Janousek's Art Shop, Columbia, Mo.

LIVE STOCK NOTES

R. P. Royce, Fieldman

MISSOURI STATE DUROC-JERSEY BREEDERS' FUTURITY

At the second annual meeting of the Missouri Duroc Swine Breeders' Association held during Farmers' Week at Columbia, plans were made to hold a Futurity Show at the Missouri State Fair in 1915.

Under the plan adopted $405 will be offered for male and female pigs of March, April and May farrow. Of this amount the directors of the Missouri State Fair and the National Duroc Jersey Record Association have subscribed $200. The balance, $205, is to be made up of nomination fees of Missouri breeders. In addition to the above sum there will be no less than six special trophies offered.

This will be the first Duroc Jersey Futurity ever held and indications are it will be a success from the start. The value of such a show is very great, and the Missouri Duroc Jersey Swine Breeders' Association is to be commended for undertaking to stage such a show. Every Missouri Duroc breeder can nominate his herd and he should do so by all means.

Full details of the Futurity together with a list of herds nominated may be had from the secretary, R. L. Hill, Columbia, Mo.

MISSOURI HAMPSHIRE SWINE BREEDERS MEETING

The Missouri Hampshire Swine Breeders' Association will hold their summer meeting at the St. Francis Hotel, St. Joseph, Mo., Saturday, May 22.

The program begins at two o'clock. E. C. Stone, Secretary of the Hampshire Swine Record Association will deliver an address. Leading breeders and feeders of the state will discuss topics of interest and importance. Special inducements will be offered Missouri breeders to show Hampshires at the Missouri State Fair and it is also planned to have Missouri Hampshires well presented at the Panama Pacific International Exposition.

Any information regarding Hampshires in Missouri will be furnished upon application to the secretary, Isom J. Martin, Lancaster, Mo.

Rauscher's Chester Whites

H. Hauscher & Son, Kahoka, Mo., have one of the oldest and best herds of Chester Whites in the West and at all times are in a position to furnish prospective buyers young stock of either sex at prices quite within keeping with the quality offered. For years Messrs. Rauscher have been breeding for size and bone, prolificacy and quality, and by the use of high class boars on the sows that they have retained in the breeding herd they have succeeded in producing Chester Whites of a very high order. They still have a few fall boars for sale, and are now getting ready to offer the fall trade a very desirable lot of spring boars and gilts. Keep this herd in mind and if you want something good at a reasonable price you will find it to your interest to buy from the Rauchers.

Faulkner's Famous Spotted Polands

Beginning with this issue of The Missouri Farmer H. L. Faulkner calls attention to his well known herd of Spotted Polands. Mr. Faulkner is perhaps the foremost breeder of the "old, original big boned spotted kind," having been engaged in the business for over twenty years. The statement is made, and is true, so far as we know, that there is not a herd west of the Mississippi that does not contain some of the blood that made Faulkner famous.

Mr. Faulkner sells between four and five hundred head a year and the most of them are sent out on mail orders. Every hog sold is guaranteed to be as represented and every one is guaranteed to be a breeder. Just now a few big husky fall boars, just right for service, are in offer. Orders are being booked for spring boars and gilts sired by some of the best known boars in the breed. Mr. Faulkner owns Spotted Mike, Good Enough, Lucky Judge and other well known and proven sires and is therefore in a position to furnish pairs, trios, or more of unrelated stock. Many of the spring pigs and several of the fall boars are out of some of the best sows in the herd.

Each year Mr. Faulkner holds two sales—one in February and one in August. The date of the coming August sale is August 11th and breeders and farmers are urged to write Mr. Faulkner and have him place their names on his mailing list for his catalog.

Mr. Faulkner will be glad to have any prospective purchaser visit his herd and see the kind he is producing.

A Great Litter

The great sow Miss Crimson Col. I Am, owned by W. H. and Geo. E. Thomson, Columbia, Mo., farrowed a litter of sixteen pigs last week. It will be recalled that this was the top sow of Chas. L. Taylor's February sale. Messrs. Thomson are expecting great things of this litter as they are sired by the champion, Col. Wonder.

Smith Bros. Durocs

In a recent letter from W. O. and B. A. Smith, Thompson, Mo., they have the following to say regarding their herd: "Our fall gilts are doing fine, a number of them will weigh around 150 pounds or more. They are sired by Beauty's Model, the first prize senior yearling boar at the Missouri State Fair in 1914, and are out of sows sired by Col. Bob. It begins to look as though Beauty's Model would be a great sow sire as his gilts have a great deal of finish, plenty of stretch and are always smooth. We will make a very low price on these at present. We have two fall boars left which are extra good that we are pricing at twenty-five dollars each. They are also by Beauty's Model and out of Col. Bob dams. We sold five boars last week, one going to A. M. Cheek of Lathrop, Mo., one to Ben Spencer, of Thompson; one to E. L. Tuepker of Rush Hill; one to Dr. Tincher and one to C. D. Heinline of Mexico. The crop prospect was never better at this time."

We feel sure that our readers will find good values in the boars and gilts referred to and would suggest that you write as soon as possible. Please mention this paper.

Jersey Cows for Sale

J. B. Smith, Platte City, Mo., is offering a nice lot of young Jersey cows for sale and our readers who are interested in securing proven blood to add to their herds will surely find it to their interest to correspond with Mr. Smith. This herd has been one of the prominent winners at the mid-West dairy shows and State Fairs for the past several years, and many of the young cows referred to in the advertisement have for their sire and dam prize winners of note. You will be surprised how reasonably Mr. Smith is pricing the stock. In writing please mention this paper.

A Monday morning shipment from H. L. Faulkner's Highview Farm. Mr. Faulkner has shipped Spotted Poland Chinas to every State.

CLYDESDALE HORSES FOR SALE

MISSOURI FARMERS, DO YOU RECOGNIZE THE OPPORTUNITY?

The war in Europe means that the United States will furnish the Draft Horses and Draft Breeding Stock for the world for years to come. There was never a better time for you to get into the game and Missouri farmers should take advantage of the opportunity. I have Prize Winning Stallions and Mares of all ages for sale at lowest prices.

F. L. CROSBY, Highview Farm - - - - - - - Mexico, Mo

POLAND CHINAS AND SHORTHORNS

Bred sows and yearling gilts bred for May farrow. Extra good fall boars and gilts. Several choice young bulls and heifers.

Satisfaction Guaranteed

H. S. WILLIAMSON, R 6 Centralia, Mo.

SUPERIOR HERD BIG-TYPE POLANDS

We have at all times anything you want in strictly big-type Polands. Special prices on spring boars and gilts in pairs or more—not related. Write us your wants.

Freeman & Russ Kearney, Mo.

LOCKRIDGE'S GIANT POLAND CHINAS

In my recent sale gilts bred to my great young boar THE GIANT 72083 averaged $57. THE GIANT is conceded to be one of the greatest boars of the breed. You will want some of his blood. Booking orders for spring pigs. Write at once.

WILL G. LOCKRIDGE - - - - - - Fayette, Mo.

BAKER'S REAL BIG-TYPE POLANDS

Our winnings at the State Fair prove that we "have the goods." Spring boars and gilts of excellent breeding and individuality at very reasonable prices. Also a number of fall boars, big, stretchy fellows.

W.A. Baker & Sons, Butler, Mo.

Dooley's Spotted Polands

Big bone, spotted pigs now ready to ship —$25 single pig, $45 pair, $65 trio. Pairs and trios no relation. Also registry furnished. Send check with first letter.

Edgar Dooley Etterville, Mo

RAUSCHER'S CHESTER WHITES!

One of the Oldest Herds In the West

A few choice spring gilts bred for early farrow. Several richly bred big spring boars. A fine lot of fall pigs. Size, quality, and bone. Prices reasonable and every pig guaranteed.

H. Rauscher & Son, Kahoka, Mo.

Maple Grove O. I. C's

Over 100 spring pigs from 2 to 3 months old at the following prices: Choice of litter, $12; litter average, $10; fall gilts, $15. Bred gilts $20 to $25. Bred sows, $30 to $35. Prize winning blood and the most popular strains. Each individual guaranteed to give satisfaction.

F. J. GREINER, BILLINGS, MO.

Adenhill Durocs

Under date of May 5th R. L. Hill, Columbia, Mo., writes:

"As per my last letter I wish you would change my ad. I am sold out of bred gilts and sows for spring farrow but will have a nice lot bred for early fall farrow. Our springs pigs are doing nicely. The sows farrowed something over 11 pigs each, on the average, this spring. Missouri Lady Again, the 1st prize sow in the six and under twelve months' class at the Nebraska State Fair of 1913, farrowed 13 pigs. She has five good boars in this litter that will make herd headers and should go to some good herd. They are sired by Col. Wonder II, the good son of the grand champion Col. Wonder. Col Wonder II is in excellent condition, and we are breeding a lot of gilts to him for fall farrow. Missouri Lady Again is by Crimson Wonder Again, grand champion of Iowa in 1906, and one of the greatest boars of the breed. Missouri Lady Again is the daughter of Missouri Lady, the $405 brood sow of 1913. Our spring pigs will soon be ready to wean and we will be in position to ship them by the middle of May to the first of June. At this time we will price them cheapest and those purchasing or in the market realize that this is the best time to buy for the express charges are light. Miss Col. Bob farrowed 11 pigs, by Col. Wonder II. She is by the first prize senior yearling, Col. Bob. Miss Defender had a litter of 13 pigs by Col. Wonder II. Columbia's Beauty by the three times champion, Beauty's Model Top, and out of Defender Girl by Defender, farrowed ten fine pigs by Col. Wonder II. She is the dam of some of our best boar pigs. Our fall boars have all been sold and every purchaser was well pleased with the animal shipped."

Greiner's O. I. C.'s

F. J. Greiner, Billings, Mo., is advertising a desirable lot of O. I. C. spring pigs at prices that should move them readily. Mr. Greiner has one of the good herds of his part of the state. Every individual sold is guaranteed to give satisfaction.

Garrard & Son's Durocs

J. C. Garrard & Son, McBaine, Mo., report that their spring pigs are coming along fine, and that they will be ready to ship out a very select lot of breeding stock this fall. Messrs. Garrard have one of the younger herds of the state but they are meeting with a nice demand. This herd was established and is being handled along very practical lines, and unless something unforseen happens it will be a marked success. Readers of this paper who are looking for good useful Durocs will be pleased with the kind Messrs. Garrard are sending out.

Milking Shorthorns

W. P. Harned, Vermont, Mo., one of the pioneer Shorthorn breeders of the United States, reports several sales of young bulls and cows from his Idlewild herd. Mr. Harned has developed his herd along dual purpose lines and he has lived to see his idea win a place.

Mr. Harned would be glad to give you full particulars regarding his herd and the young stuff he is offering if you will write him. We recommend his herd and assure our readers that they will find Mr. Harned a high class man to deal with. Mention this paper in writing.

A Hundred Per Cent Herd

H. S. Williamson, Centralia, Mo., who advertises Poland Chinas and Shorthorns in this paper, reports saving every pig farrowed. While the litters are not as large as usual, they have averaged a fraction over seven and one-half. Such a record would be very unusual in any year, but in this year, which has registered such a heavy mortality of spring pigs, a hundred per cent crop is very remarkable.

Mr. Williamson has been breeding hogs for thirty years and this is the first time he has succeeded in saving all his pigs.

In view of the above it is evident that Mr. Williamson is going to be crowded for room and he is therefore making very low prices on his fall boars and gilts. You are sure of a bargain, backed by a guarantee that everything sold will be as represented, and we suggest that you write at once. Please be good enough to mention this paper.

Lockridge's Polands

Sometime ago we looked over the herd of big type Polands owned by Will G. Lockridge, Fayette, Mo. Mr. Lockridge reports an unusually heavy loss of spring pigs this year, but notwithstanding this fact, he will be able to offer his trade the best lot of spring stuff he has ever raised.

Most of the spring pigs are sired by his mammoth young boar, The Giant. This boar is coming up to early predictions and is developing into one of the largest boars of the breed, and judging from his spring pigs he is a sire of the right kind. Last winter Mr. Lockridge added several very high class sows to his herd and will be in a position to offer an attractive lot of boars and gilts in his September sale. Above is a picture of his young herd boar, The Giant.

The Giant, Will G. Lockridge's mammoth young herd boar. Most of the spring pigs in the Lockridge herd are sired by The Giant.

Attractive Angus Offering

J. M. Jones, Everton, Mo., is offering a number of good, useful young Angus bulls and heifers. This young stuff is well bred, well grown, and priced worth the money and furthermore is guaranteed to please.

Superior Herd of Polands

The Superior Herd of big type Polands owned by Freeman & Russ, Kearney, Mo., ranks as one of the good herds of the state and buyers will do well to investigate this herd before they make their purchases. They can furnish a few big strong fall boars, ready for service, at bedrock prices.

Sutherland's Angus

Readers of The Missouri Farmer are reminded that D. L. Sutherland & Sons, Windsor, Mo., are offering several choice young Angus bulls and a number of heifers and young cows. The Sutherland herd has been in existence for 30 years and this fact alone is evidence that the kind of cattle they are producing meet with the approval of careful buyers. Kindly mention this paper when you write.

SILAGE IS INDISPENSABLE

Replying to your request asking for our experience with silos and silage: in the first place silage is indispensable in feeding stock. There can be no failures with silage if any judgment whatever is used in feednig. I have been using silage three years and I have never regretted for one minute that I built a silo. I feed to horses, cows, sheep, cattle in fattening; also stockers and milk cows. I have made silage a principal ration for fattening mules and I have sold some of the fattest mules I ever owned on silage sheaf oats and a limited amount of ear corn.

The farmer who is trying to get along without a silo is making a grave mistake, however, many are seeking various excuses for so doing.

Solomon said, get wisdom but Kelley Wright and I say build silos and prosperity will be added.

Now in regard to the kind to build. I have one 18x36 and one 16x34, one-piece Oregon fir, but a wooden silo will make you lose your religion when empty and if I ever build another—which I intend doing—I shall build concrete or tile.

I am now feeding 50 1100-pound steers on silage and cotton cake and they are making a gain of two pounds a day. This silage is made from corn which made about 15 bushels per acre.

Milt Householder,
Audrain County.

CARRYING BROOD SOWS THROUGH THE SUMMER

For three years the Minnesota Experiment Station has studied the value of pasture crops for the maintenance of dry brood sows during the summer. Each season several sows have been fed in the dry lot just enough grain to maintain their weight. Similar groups have been put on pasture and given no grain.

The efficiency of the pasture crops has been measured in two ways: First by the live weight of sows carried, and second, by the amount of grain required to equal one acre of a given pasture. R. C. Ashby, in charge of swine at University Farm, reports results as follows:

1 acre		Wt. of sows supported	No. of days
1913	Rape	1699	99
1914	Rape	3145	84
1913	Oats, peas and rape	1790	83
1914	Oats, peas and rape	3298	56
1914	Bluegrass	4205	77

Rape has proved superior as a replacer of grain. The grain in 1912 was charged at the average price for the summer. In 1913 and 1914 corn was charged at 50 cents a bushel, and tankage at $50 a ton. The results obtained follow:

Crop	Weeks of pasture for one sow	Grain replacement per acre
Rape (3 yrs. average)	75	$13.76
Oats, peas and rape (3 years average)	52	10.04
Bluegrass (1 year)	90	3.76
Oats (1 year)	30	1.69
Sorghum (1 year)	52	.63
Corn (1 year)	36	4.12

Bluegrass shows low here because all weight lost by the sows was figured at 7 cents per pound and deducted from the value of grain saved by the pasture.

Alfalfa and clover are among our best pastures but many farms do not have them. Try an acre of rape this year. Sow four to six pounds of seed per acre.

GALLOWAY CATTLE
Young stock for sale at all times. Herd established 25 years.
J. & W. R. CLELLAND, New Hampton, Mo.

Aberdeen-Angus
I am offering a number of young bulls, cows and heifers—good individuals and well bred. Also some extra good Poland China Hogs at moderate prices.
I. D. Blackwell Fayette, Mo.

ANGUS CATTLE
HERD FOUNDED 1904
Seven early calves—3 BULLS and 4 HEIFERS, sired by Dean's Eric 139686. Every one the right kind, and priced to sell.
V. E. LAWRENCE, SALISBURY, MO.

Angus Bargains
Registered bulls and heifers. The market topping kind. Leading families represented. Priced worth the money and satisfaction guaranteed.
Also Poland China hogs.
M. JONES, R. F. D. 3, EVERTON, MO.

THOMAS E. DEEM
AUCTIONEER
Selling pedigreed live stock is my specialty. Eight years of success in this line has proven that my customers are pleased.
Dependable service at a reasonable charge. Address, Cameron, Mo.

Harry W. Graham
AUCTIONEER
PURE BRED LIVE STOCK
Seventeen years experience with America's best breeders.
Chillicothe, Missouri

W. D. ROSS
Auctioneer
Pure bred live stock. Sales made anywhere on reasonable terms. Write for dates.
Otterville Missouri

Glenvarloch Large Yorkshires
The prolific, growthy and gentle bacon hog. Closing out entire herd at private sale. Bred sow, boars and pigs either sex. The produce of one Yorkshire sow will keep your family in delicious meat all next winter. Everything at bargain prices. All immune.
Frank Gildow, Mgr., Jamesport, Mo.

JERSEY CATTLE
Bulls ready for service. They are sired by the Owls Champion 85990. His grand dam on dam's side, Rubano's Fancy, has a record of 21 lb. 10 oz. in 7 days. We have these young bulls for sale at a price that ought to move them. Also a few heifers.
Wm. H. Bruns & Son, Concordia, Mo.

SPOTTED BOARS-JERSEY BULLS
We have a dozen Jersey bulls ready for light service and a dozen Big Boned Spotted Poland-China boars of November farrow that we will price very low for quick sale. Also bred heifers and spring pigs to offer.
The ENNIS FARM, Horine Station, Mo.
(Just south of St. Louis)

Jersey Cows
I want to sell 20 head of registered cows and heifers that are either fresh or soon will be. Also four young bulls.
J. B. SMITH Platte City, Mo.

Holsteins Wanted
Wanted, a herd of about 25 registered Holsteins, over 2 years old. Give price and full particulars first letter.
W. F. PHELPS, Aurora, Mo.

HOLSTEINS
Young bulls and heifers from A. R. O. cows. Sired by Sir Korndyke Imperial 53683. Eighty per cent of herd have A. R. O. records. Inspection invited.
M. E. Moore & Co., Cameron, Mo.

IDLEWILD SHORTHORN CATTLE
Milk and Beef Type. Dual purpose in name and in fact. Herd 50 years old. In one family, on one farm. The type is fixed. I have a strain that I believe rivals the famous Duchesses. Fine beef cattle that are heavy milkers. And deep milkers of fine beef type. Call, or this blood is safe by order.
W. P. Harned, Vermont, Mo.

Shorthorn Bulls and Heifers
PEABODY FARM now offers 12 choice young bulls and 20 heifers. Good individuals; reds and roans. Priced to sell. Also 20 open BERKSHIRE gilts. Get our prices.
June K. King & Son Marshall, Mo.

ChoiceAberdeen-Angus
Established 30 years. 100 head in herd. We are offering good useful Bulls, and Heifers of excellent individual merit and breeding. Prices reasonable. Our customers make them popular.
D. L. Sutherland & Sons Windsor, Mo

BUCKSHOT BY THE PROFESSOR

William J. Brine don't need hair cuts as bad as he used to. He's getting as bald headed as a pumpkin.

Here's hoping that old Jupiter Pluvius is onto the fact that a chinch bug hates moisture like the Devil hates holy water.

Some "greaser" took a pot shot at Villa down in Mexico the other day. Then another greaser cut loose and killed the first greaser. Any greaser who would shoot at Villa—and miss him—ought to be killed.

I am getting tired of hearing those foreigners talk so all-fired much about "culture." We can skin 'em to death on Agriculture—and that's the kind of culture that fills up the pantry and the dinner-pail.

If there is some bright, deserving farmer girl in your community who would like to win a beautiful piano, have her send in her name to the publisher of this paper at once. This is strictly on the level—an opportunity worth looking into without delay.

Some Kansas fellow with a ball-bearing tongue says, "If you'll cast your alfalfa before swine your wife will wear pearls." It's my private opinion, though, that the swine would have to sell for a little more than $6.75 per hundred weight. The biggest hogs in this Country are the fellows who buy them—and they're the kind that never get the cholera either.

There are a lot of bright little orphan boys and girls in St. Louis and Kansas City who need to find good homes out on the thousands of splendid farms in Missouri. If there are no children in your home, write us and we'll help you pick out a fine one. A home which doesn't resound with the golden laughter of a child isn't much of a place to live in.

With the Fourth of July coming on —with old man Huerta headed for old Mexico with a new supply of "Old Crow"—with the submarines still doing business at the old stand in the North Sea, with Billy Sunday calling everybody a liar and a horse thief, with a good supply of chinch bugs and Hessian flies on hand and the creeks full of catfish, I look for an "interestin' " summer.

I asked Mr. Ellis, the editor of this paper, the other day what a farmer should do to prevent damage to his corn by chinch bugs. He says that one good way is to sow cowpeas or soybeans in the corn. These, under half-way favorable conditions produce a rank growth which helps to hold moisture—and you know there's nothing that will make a chinch bug get peevish and cuss as quick as moisture. Others claim that the bug don't like the smell of cowpeas or soybeans and that the moment he comes in contact with them he gets "sore" and goes in the other direction. Personally, I don't think that anybody who smells like a chinch bug has much of a kick coming on how other things smell—but I guess that's his own private business. Anyhow, Mr. Ellis—who comes mighty near knowing what he's talking about when it comes to bugs and a lot of other things—says that a chinch bug and a cowpea won't speak as they pass by—and it might be worth your while to write to him and get the exact "dope." If a cowpea or a soybean can raise a lot of feed for hogs and raise the Devil with chinch bugs at the same time I am in favor of electing both of them to the Legislature. Being bean or pea headed is certainly no worse than being "pin headed." I'd write more but a band has just come into the hotel trying to bust their horns playing "Dixie"—and I never could write about cowpeas and chinch bugs and listen to a band play "Dixie" at the same time. It makes me feel like I wanted to fight—or vote the Democratic ticket.

CHINCH BUGS

No doubt you've "got 'em."

Don't you wish we did not "have 'em?"

Too late now to swat the chinch bug for this year of our Lord 1915. The weather man may do it for us and we are no doubt "willin ."

Some hot, wet weather is about all that will do us any good now—even that hail did not do the work.

If we get some wet, hot weather a disease breaks out among them, but this disease is active only under certain weather conditions, and such weather may not be as much as once in six to ten years, so it would seem unwise to depend on the weather man to rid us of chinch bugs.

What can you do? Too late now to do much except perhaps to grow some crops that chinch bugs do not eat.

You were told week after week and almost day after day, through the press of the whole county, the city daily, the agricultural papers and your home paper to put up a winter fight on these pests. Did **you** do it? If not, why not take your medicine now and not put up a howl? That dirty, weedy hedge row, that bushy, weedy hollow, that old straw pile that you did not scatter out, and those shocks of fodder that you left standing in the field till spring, those old boards, and chunks, and dead trees with loose bark, all helped you to keep your chinch bugs in a good place ready to help you harvest your wheat.

It is very true that we did not have very much good weather for burning brush and grassy and weedy places, and weather pretty must against us in a clean-up process, but did **you** really try your best? If **you** made no effort, why do you kick now? If **you** did not know of these things, you surely do not even take your home paper, or if you do take it you don't read it.

Some burned corn stalks after the bugs had gone, so it is surely evident they did not burn them with any view to destroying bugs.

Millions of bugs harbored in corn fodder and straw stacks, and the other places mentioned and until we can get it into our heads, that we must take measures of warfare into our own hands, and not depend on the weather man, "diseased bugs," etc., we can expect just such a situation at intervals of every few years.

There is no parasite that we know of that works destruction to chinch bugs, as is the case with army worms, plant lice, and in fact most all other pests.

The quail is the only bird that will eat chinch bugs, but somehow the average one of us would rather put the quail in our own bellies than to allow the quail to put our chinch bugs into his.

One fellow said "why all the quails in creation could not eat all the bugs in the wheat fields." Now wasn't he bright? Of course they could not after the bugs were out and busy multiplying, but in winter don't you know that the quail stays about just such places as these bugs are to be found in winter? If there was but one pair of house flies in your home in January, and you would swat them, and there were no other flies in the universe, it would be an easy job to eradicate the house fly, but if this pair were not "swatted," but allowed to breed, there would perhaps be at least one million by fall, then the swatting would be a big job. The good the quail does it to "get" the bug in winter when food is scarce, as the bugs leave their hiding places in early spring.

Ben Franklin said, "Old Man Experience keeps a hard school, but it is the only school in which a fool will learn anything." How many of us will learn this chinch bug lesson even at the school of experience? What name can you suggest for the fellow who will not learn even in the school of experience?

One man thought he would "plow his wheat and the bugs under and plant to corn." Wouldn't that be "jumping out of the frying pan into the fire? Chinch bugs will eat any of the grasses and it would seem wise to put in a crop when the wheat seems to be lost, that the bugs will not eat. Corn, millet, cane, Kafir, and all the other grasses are only feed for the pests.

Chinch bugs will not eat soybeans nor cowpeas, and good crops of these may be grown by seeding as late as June, and fair crops where soil is good and moisture reasonable, sown even as late as July 10th.

It may protect the corn some by sowing a strip of beans or peas twenty to forty feet wide along the margin of the corn field when the corn field is next to a bug infested wheat field.

These should be sown pretty thickly, and it is very generally thought the bugs will not crawl across the bean strip. Some think that beans in the corn will afford a great deal of protection to the corn against the bugs, but there is not yet enough evidence to suggest more than to make a trial and see what the results may be. Some seem very positive that it will help, but I am not venturing any opinion at this time, but suggest a trial.

Sam Jordan.

Here's a smoke *without* a sting!

You get on the shady side of the lane long enough to jam your old jimmy pipe brimful, or roll a makin's cigarette with Prince Albert, make fire with a match—and go on. *For you've got yours!*

That's all there is to it—this having real fun with a pipe or a cigarette —if you follow suit with men all over the nation and smoke P. A., because it is made by a patented process that *cuts out* tongue-bite and throat-parch! No tobacco ever was, or can be made like

PRINCE ALBERT

the national joy smoke

Don't let your palate protest every time a whiff of jimmy pipe joy or cigarette makin's happiness breaks into the atmosphere! You start in right away with a pipe or cigarette and a tidy red tin of P. A. It is a guarantee that you'll be jimmy pipe joy'us and cigarette cheerful!

Prince Albert smokers everywhere are enthusiastic over the pound crystal-glass humidor with the sponge-moistener top which keeps the tobacco in fine fettle—always. Prince Albert is also sold in toppy red bags, 5c (handy for cigarette smokers); tidy red tins, 10c; and handsome pound and half-pound tin humidors.

R. J. REYNOLDS TOBACCO COMPANY
Winston-Salem, N. C.

TRY This HOG OILER 30 Days FREE At My Risk

SEND NO MONEY

If you will write and tell me how many hogs you have I will send you at once, all freight charges paid, as many of my New Idea Hog Oilers as you want to try and one gallon of Medicated Oil free with each Oiler. You can put them up in your own hog yard and let your hogs rub against them 30 days at my risk. If you don't say my Oilers are the simplest, safest, most durable and most economical Hog Oilers on the market, and the best investment you can make for your hogs I will pay the return freight charges and not ask you to pay me a single penny either for the use of the Oiler or for the Oil consumed.

ROWE'S NEW IDEA HOG OILERS

have no valves—nothing to get out of order. Stock can't break them. Dirt can't clog them. Oil can't be wasted. Rain can't wash out oil. Every drop is applied as needed **right on the itch** when the hog rubs. Pigs of all sizes and ages can rub on these Oilers and keep themselves vermin-free, mange-free and healthy. Three rubbing bars on each Oiler. One Oiler accommodates 30 to 50 hogs. Uses either crude or Medicated Oil. **Helps prevent hog cholera.** Keeps animals comfortable, contented—and they put on flesh faster—make you more money.

I'll Furnish the Oilers—I'll Furnish Oil—I'll Pay the Freight

Prove these claims at my risk on your own farm before you pay. Just write and tell me how many Oilers you want to try. Send no money. Order direct from this advertisement or if you prefer write for big illustrated folder today.

Alvin V. Rowe, Pres., ROWE MFG. CO., 101 Liberty St., Galesburg, Ill.
Also Makers of Famous CAN'T-SAG Gates

Save $2 to $12 on Each Oiler at these Cut Prices, Pay If Pleased

1 Oiler	$ 7.75
2 Oilers	15.00
3 Oilers	21.75
4 Oilers	28.00

1 Gal. Medicated Oil Free with each oiler. If you wish to send check with order deduct 25c for each Oiler ordered. Money back if not satisfied.

The Missouri Farmer is offering a beautiful piano to some bright, ambitious farmer girl in every community in Missouri. By putting in your spare time for a few weeks you can easily earn one of these handsome instruments Please write us for full particulars at once. Delay means that some other girl will get your territory.

A farmer told us the other day that the best paying crop he raised last year was soybeans. He planted them in rows 36 inches apart, cultivated them like corn and grew 15 bushels per acre. At $2.50 a bushel that would look pretty good in a dry year.

BETTER FARMING BETTER FARM HOMES BETTER CITIZENSHIP

THE MISSOURI FARMER

COLUMBIA, MO.

THE HOME OF MISSOURI'S GREAT AGRICULTURAL COLLEGE
AND THE MISSOURI EXPERIMENTAL STATION

Rendering Service

That The Missouri Farmer—although a young paper—has won for itself the first place among the thinking farmers of Missouri is a fact to which the thousands of commendatory letters which we have received during the last few months bear eloquent testimony. For years Missouri was without a **home** farm paper—a paper devoted **exclusively** to the Agricultural and economic interests of this state—a paper edited and owned by men who are a part and parcel of the great commonwealth they are trying to serve and who understand, first hand, the many difficult problems with which Missouri farmers have to deal.

Located in Columbia—the home of Missouri's justly famous Agricultural College, the Missouri Experiment Station and the State Board of Agriculture—this fact gives us facilities for farm paper material possessed by few other farm journals in the Country. Again, nowhere in the Corn Belt is there an Agricultural editor of riper or sounder understanding than Geo. B. Ellis, the Managing Editor. Born and raised on the farm and a practical farmer for many years himself—these fundamental qualifications coupled with his long service as Secretary of the State Board of Agriculture and his natural love for the farm make him the soundest and safest adviser the farmers of Missouri have ever had. It is therefore no wonder that the leading farmers of this state have come to **depend** on The Missouri Farmer—that they regard it in a class by itself and accord it the first place on their reading tables.

But The Missouri Farmer concerns itself not merely with the raising of better crops and better livestock but with those economic questions which, from time to time, vitally affect the well-being of the farmers of this state and which it is in better position to understand and discuss than those farm publications which are edited and owned in other states. Thus, in 1912, The Missouri Farmer was the first publication of any consequence in Missouri to raise its voice against the danger of the Single Tax iniquity and the chief pamphlet against that proposal—which was circulated by the thousands of copies from one end of the state to the other—was written in this office. It was the first big opportunity The Missouri Farmer had to demonstrate the value of a **home** farm paper and it left no stone unturned to defeat a heresy which would have done incalculable injury to the farm owners of this state.

Even so, during the last two years—in article after article—we have pointed out that the time has come when the farmers of Missouri must have cheaper and longer time money if they are to make the most of their opportunities. It was therefore with no small degree of satisfaction that we witnessed and aided in the passage of the Gardner Land Bank Law by the recent Legislature—a measure the successful consummation of which will mean more to the farmers of this state than any act which has claimed the attention of our people in many years. In making it possible for the farmer to obtain money at low interest rates and upon easy terms of re-payment we will not merely place the Agricultural interests of Missouri upon a sounder basis than ever before but likewise it will bring a greater degree of prosperity to all other lines of business which depend primarily upon this great fundamental industry—and hence, even as The Missouri Farmer has led the fight for an Agricultural Credit law during the last two years, so it proposes to devote itself unceasingly from this time forward to the task of assuring final victory for the pending act at the polls. In a few weeks we will be ready to supply blank petitions for the necessary Constitutional amendment. Already we have hundreds of requests for petitions on file—and we trust that all our readers will help out in this good work. If therefore, you are willing to circulate a petition in your neighborhood, please advise us at once.

In the meantime, we promise our readers such an exhaustive discussion of this great question as will enable them to do most effective missionary work among their friends and neighbors. That it will make you a little more loyal toward **The Missouri Farmer** which is once more demonstrating that it has a great and vital mission in this state and that you will try to induce your neighbors to become subscribers is my concluding hope.

The Publisher.

FARMERS' CLUBS

We have arrived at a stage in the history of this country when the farmer will have to begin to develop a more permanent system of agriculture. There was a time when, if a young man wished to have a farm, all he needed to do was to go out west and take up a claim. There is no more land in the Corn Belt which is subject to homestead.

At first thought we might question whether this had anything to do with a change in methods of agriculture, but let us remember that the price of land has more than doubled in the last few years. This has brought new problems, for it is harder to make high-priced land pay interest on the investment than it is to get the same rate of interest out of cheap land, acre for acre. So the young man of today has problems to solve that his father did not have, and we necessarily are passing from an era of exploitve agriculture to one of more permanent methods. The farmer must become a more careful business man in the future than he has been in the past. His farm must be more carefully organized. With this organization will come heavier investments of capital, which will compel a permanence in the system of agriculture of a community.

We want the permanence in agriculture, and we want the man who will start the building of a herd of cattle and carry it along so successfully that his son will look upon it as too good a business to leave. The son can take up the work where his father leaves it and make improvements in methods and buildings so that the business will continue to grow. It is profitable to run a well-organized farm, and still more profitable to run it in a communtiy which is following the same general lines of farming. The farmer must become better acquainted with his fellow-farmer. In order to do this he needs some sort of an organization or club in which he can discuss with his brother farmers the problems which confront each of them. He must not consider his time wasted when he spends it in association with those who are in the same line of work as himself. He may not get wages in dollars and cents for the time he puts in at the club, but the understanding of the problems of his fellow-farmer which will come to him through this association will be indirectly very valuable. The form of organization is really immaterial, but it should be one in which the women and children have a place, for farmers and their wives have always worked together, more perhaps than men and women have in any other occupation.

Let us turn our attention to some of the things that a farmers' club can do. Take, for instance, the school. I am not one of those who assert that the common country school is a failure, but there is no question but that the efficiency of the average country school is too low. If the farmers will get together and look upon the school from the standpoint of making the school what it ought to be, I believe they will make changes which will lead to the improvement of the work done in the school, as well as lessen the expense per pupil. It is not the purpose of this article to outline a definite plan for a change in our school system, but the farmer should get ready to listen to plans of this kind. There is not a better place than at a meeting of his club, where there will be free discussion and every effort made to get at the facts.

The farmers' club can be used as a means of entertainment and as a means of making country life more agreeable to the young people, and thus keep those on the farm who should stay there. The tendency of farmers to move from place to place can be overcome to a large extent by having a real live farmers' organization in the community to overcome discontent. "Far-away pastures always look green" is an old saying in which there is a good deal of truth. It should be the definite purpose of every farmers' club to make the home pastures look green.

Then there is another subject in which farmers have a real live interest, and that is the subject of roads. Whether they are good, bad or indifferent, he is interested in them because there is no citizen who uses the roads more than he.

Perhaps the greatest effect of the organization of a farmers' club is the effect on the farmer himself, the individual man. The farmer needs the training in parlimentary law that he will get in a good farmers' club. He needs to rub up against his fellow-farmer. He needs to learn that farming today is not the same as it was thirty years ago. The farmer has always been a good hand at putting on brakes, but the time has come when he should take the initiative and do something to build up his community in place of hindering some one else from doing anything.

There is nothing equal to a regular organization to help a man boost for his community. He can and should join his farmers' club, and then work for the development of his community and make it the best community in the state.—O. P. Drake, County Farm Agent, in Report Kansas Board of Agriculture.

SEED CORN DAY AT ALTON

It was the occasion of the distributing of sixteen hundred packages of seed corn, each containing one peck of Boone County White corn. This corn was given away by the Bank of Alton to the farmers of Oregon County, Mo. —and a more generous act, a more substantial, sound and sane piece of business work was never put into calm and deliberate execution in this state, and to the best of my knowledge the only case of just this kind on record in the state.

As an example of thoughtful enterprize, for magnanimity and business sagacity, this work stands out in bold relief, without a parallel, in a class by itself.

The first half of April in the Southern Ozarks compares very favorably to the first half of May in the northern part of the state. At this particular season of the year nature is donned in her favorite robe. The sweet song birds are attuned in melodies of the new springtime. The flowers are in bloom. The peach trees have on their livery of pink, purple and red. The cherry and plum trees are bursting with snow. The native forest trees are putting forth their tiny, tender leaves—and the clean, sparkling streams are murmuring along their mossy banks—and all in all it causes the true lover of nature to join with the poet in singing:

"Is this a time to be gloomy and sad?
When Mother Nature smiles around
And even the deep blue heavens look glad,
And gladness is heard in every sound."

Just such a day was Seed Corn Day at Alton, Oregon County, Missouri. Early in the day as the sun rose to shed its benignant rays upon green swards and green fields, there could be seen men, women and children, who had laid aside the tasks and cares of the farm for the day, coming in from every nook and corner, dale and dell and glen, to spend a day socially together, and to register their appreciation of the kindly interest of the business men of that hustling little "City of Brotherly Love" and the stockholders of this Bank of Alton had and were taking in their material welfare.

Permit me to remark that the president of the said Alton bank is no less a personage than the amiable, genial and gallant Alex Young, member of the Missouri State Board of Agriculture from the 14th Congressional District. Mr. Young is one of the highly successful farmers of his section and stands four-square to all the earth for a better and higher Missouri agriculture and his farm, his home, his hospitable wife and charming daughter are all concrete examples and living testimonials of what can be done and accomplished in farming and home-making in the rugged yet beautiful Ozarks.

Long before noon it was plain to be seen that no hall or assembly room in Alton could accommodate the throngs, so the benches from the circuit court room and the churches were arranged in the capacious courthouse yard and under the beautiful trees as of old—"When the groves were God's first Temples" this, one of the most interesting meetings of all the year, was held.

Armed with a set of Seed Corn Charts, the writer talked corn culture in all its phases for a space of two hours. The full and the complete publicity that the bank had provided for this occasion had placed the auditors in a frame of mind to drink long and deep at the fountain of King Corn and all that it means to them as a people and to that part of the state.

Let it be said for the sound judgment and benevolent spirit of the Bank of Alton and the people of Alton, and the citizenship of Oregon County, that such seasons of mingling together and getting acquainted should and will provide an example, and set a mark to be followed, and create an ambition to be reached by other communities in this state.

In all commendable enterprises along the royal highway of development and permanent betterment some individual or collection of individuals must lead the way. Oregon County, Missouri, unfurled her banner in a righteous cause, "More and Better Corn"—and here is hoping and trusting that a favorable season, coupled with intelligent industry, will emblazon upon this trustworthy banner the word "Victory" in letters of such magnitude that can be seen and read, state wide, by the children of men for generations yet to come!

W. D. McKee,
Farmer' Institute Lecturer,
State Board of Agriculture.

Write it on the film—at the time.

Make every negative more valuable by permanently recording, at the time of exposure, the all important date and title. It's a simple and an almost instantaneous process with an

Autographic Kodak

Whatever is worth while in hand camera photography is found in the Kodak. So simple that the amateur can make good pictures from the very start, using dependable, non breakable Kodak films with which the camera loads in daylight. The cameras themselves are accurate and reliable in every detail, the lenses are of the highest grade and the shutters work with a precision that is a mechanical delight. Kodak films may be developed without a dark-room or may be mailed to your finisher—the Kodak printing processes are simple in the extreme. Indeed Kodak has come to mean "photography with the bother left out" and it's less expensive than you think.

The latest Kodak feature is the Autographic idea. A little door in the back is opened and you write on the red paper of the Autographic Kodak cartridge any data that you like—the date or the title of the picture, or perhaps you photograph a friend and then he writes his name on the red paper. Or you can write down the details about the exposure for future guidance—the condition of light, the shutter speed and the stop opening used. In photographing the children you write down their age at the time the picture was made. In using the Kodak in a business way, there are always details of the utmost importance that can be jotted down which will add to the future value of the photographic record. When the date or title or whatever it may be that is written on the red paper, is exposed for a second or so to the sky the door is closed again and upon development such writing is found to be permanently imprinted on the film—occupying the intersecting space between negatives.

Whether photography interests you from the business side, or for the home and travel pictures or from the standpoint of the pure pleasure of picture taking—the camera becomes doubly useful, doubly fascinating if it has the Autographic feature. There's no extra charge for Autographic film and Autographic Kodaks are sold from $6.00 up.

Ask your dealer or write us for "Kodak on the Farm," a beautifully illustrated booklet that you will enjoy. There is no charge.

EASTMAN KODAK CO., 454 State Street, ROCHESTER, N. Y.

A CONCRETE SILO A SUCCESS

I have a reinforced concrete silo 12 by 28 feet which I built in the summer of 1911 and it has been a success. Will give my experience for this winter. I started feeding the 15th of December, 1914, 19 head of cattle, 5 work horses, 2 coming yearling colts and seven head of coming three-year-old horse and mule colts.

Nine head of the cattle are fed nothing but silage and wheat straw. The balance of the cattle are fed some cottonseed meal with the silage and also run to the stack of wheat straw.

The five work horses and the two colts are shut up in the barn every night and are fed some dry corn and corn fodder with the silage. The seven 3-year-olds have no shelter but the straw stack and are fed nothing but silage and the straw and are in as good condition as the horses that are stabled every night.

This is the second winter that these colts have been wintered the same way.

I am confident that I have enough silage to feed this lot of stock until the first of April.

The corn to fill the silo was raised on about ten acres and was drilled corn. It would have made about 20 bushels of badly worm-eaten corn to the acre, as it was planted late and six acres of it was planted three times on account of drouth and army worm.

Lewis M. Wood, Franklin County.

The Missouri Farmer is offering a beautiful piano to some bright, ambitious farmer girl in every community in Missouri. VOLUME VII JUNE 1, 1915 NUMBER 11

The Crop That Will Pay

By Geo. B. Ellis, Managing Editor

A crop that pays is the kind most men are looking for and are glad to cultivate. On May 20th of this year, 1915, the market reports of St. Louis stated that the first car of new Missouri alfalfa had sold for $14 a ton. Counting $4 a ton for freight and commission the man who loaded the alfalfa on the car at a Missouri station realized $10 a ton, which is equivalent to $10 an acre with a good chance to repeat the operation three times more before the crop season is ended. We know of no other farm crop that will yield a ton of dry, nutritious hay from an acre of land by May 20. We know of no other crop that will repeat this process until three to five tons of the most valuable hay known to stock men has been produced from each acre of land, but in spite of these facts not more than four farmers out of every one hundred are trying to grow this crop which pays so well and which is a guarantee against drouth and empty hay barns.

Farmers say they want facts supported by experience and that suits me to a dot. Since I was just large enough to reach up and hold the plow handles I have known the value of proving things by trial, by several trials, and especially is that true in a business controlled by so many factors as we have to contend with in growing crops. Alfalfa has passed the experimental stage in Missouri—not by the individual farmer but by more than five thousand farmers who have been growing it long enough to prove it in all kinds of seasons and on many kinds of soils. These trials show there is not a county in the state where alfalfa can not be grown and with good cultivation, drainage, lime, manure and inoculation there are very few farms where alfalfa can not be made to produce a better paying crop on at least a part of the farm than any other field crop.

One of the best known and most successful alfalfa growers in the country and a man who has traveled thousands of miles to learn about alfalfa, Joe Wing of Ohio, is quoted as saying that a crop of alfalfa on land adapted to it is worth twice as much as a crop of corn. This statement can be more than substantiated by the crop statistics of Missouri. The crop report of the state board of agriculture made up—not by office experts—but from figures furnished by the farmers themselves, shows that for the last three years the alfalfa crop has been worth nearly three times as much as the corn crop of the state not including the value of the fodder. These three years cover one fairly good year (1912) and two extremely dry years (1913 and 1914). The following figures show the relative yield, price and value of the two crops taking the average of the whole state:

Alfalfa	1912	1913	1914
Av. Yield, tons	3.28	2.9	2.7
Farm Price	$13.00	$17.00	$15.65
Acre Value	42.64	49.30	42.25
Corn			
Av. Yield, bu.	31.9	17.6	23.6
Farm Price	.43	.73	.66
Acre Value	$13.71	$15.84	$15.57

An analysis of the figures will show that the value of the alfalfa in both years 1912 and 1913 was just a little more than three times the value of the corn and for 1914 it lacks but little of being three times the value of the corn. It may be true that the small acreage of alfalfa grown in the state is on a better average of soil than the corn, but allowing for that it is safe to say the alfalfa is worth double the value of corn grown on the same land. This, of course, does not take into consideration the value of the fodder when saved in the silo. If we take a field of good corn land that is good for seventy-five bushels of corn, the crop is worth $37.50 per acre at 50 cents a bushel. On land that will grow seventy-five bushels of corn per acre we should easily grow five tons of alfalfa hay which at $15 a ton will be worth as much as the corn raised on two acres.

After the hay has been put in the windrow it can be handled very rapidly with sweep rakes and stacker. There is no other kind of machinery that will pay a greater percentage on the investment than present-day improved hay implements. Man-made machines take the place of man labor, and if taken care of are a good investment.

Feeding Value of Alfalfa

When a crop can be grown that will benefit the soil it grows on, will save the washing of the soil which is one of our most serious losses in cultivated fields and when it is a demonstrated fact that under favorable conditions this crop will produce more pounds of pork, beef or butter than most any other crop we grow, is it not time we were all trying to grow it? We may like to grow some crops better than others and I think a man is justified in growing a crop he can get enthusiastic about, but after all in ninety-nine cases out of a hundred it is the profit in a crop that makes us like it. I have heard men say they liked to grow wheat better than any other crop but I have seen them drop wheat out of their rotation after the chinch bug or Hessian fly had spoiled a crop. But if it is sentiment that should control our farming operations what crop is more beautiful to grow than alfalfa? For seven months in the year it will cover our hillsides and valleys with a beautiful green carpet and I know of no landscape scene more beautiful than an alfalfa field in full bloom.

The very best authorities tell us that a ton of first-class alfalfa hay has a feeding value about equal to a ton of wheat bran. Hundreds of Missouri farmers, particularly dairy farmers, have bought thousands of tons of wheat bran during the last two years and they paid from $20 to $27 a ton for it. On that basis it is easy to figure out that the hay grown in one season on an alfalfa field would bring from $60 to $100. In a Kansas experiment a few years ago it was proved that 100 pounds of good alfalfa hay produced as much pork as 96 pounds of corn. When corn is worth 70 cents a bushel a ton of alfalfa hay upon that basis would be worth $24. An acre of alfalfa with a good stand will pasture from ten to fifteen shoats or will furnish plenty of forage for a brood sow and her litter. With a light feed of grain there is no better method for making cheap pork than to pasture the hogs on alfalfa. With this light pasturing two or three cuttings of hay can be had each year and the stand of alfalfa maintained. It is never a good idea to pasture alfalfa heavily for the tramping will soon kill it out, but where it is pastured lightly and mowed it will last three or four years and then a big crop of corn can be grown on the alfalfa field. Where this plan is followed there should be two fields so that the hogs may be kept off for a while after the alfalfa is cut and give

The side delivery rake is almost a necessity in handling alfalfa. As soon as the new cut hay is well wilted it is put into windrows with the side delivery and after curing on top is easily rolled over when it is soon ready to go into the stack or in the barn. The hay loader is another labor saver.

the next crop a chance to get established.

For feeding beef cattle where corn ensilage is part of the ration alfalfa is ideal. Nothing is better for young calves, for dairy cows and bright alfalfa hay is a first-class feed for all grades of horses, but we would advise never to feed mouldy alfalfa to horses and furthermore alfalfa should not be kept before horses all the time. It is best to limit the amount fed to horses to part of the ration, making up the rest of the rough feed with corn fodder, cane hay, prairie or timothy hay. Such a combination makes a most valuable feed. Why will farmers go along in the same old way spending thousands of dollars every year for oil meal, tankage, bran and other feeds to balance up their corn, corn fodder and timothy hay when they could save all with a few acres of alfalfa? I leave the answer for our readers.

How to Grow Alfalfa.

Perhaps the greatest reason why farmers have not raised more alfalfa in Missouri is because they did not understand how to grow it. I have heard farmers say they did not grow clover because they had tried it may be once or twice and failed to get a stand but perhaps across the road another farmer was growing good crops of clover with little trouble about getting a stand. The same is true in a greater degree with alfalfa. It is true that alfalfa is a little more exacting in its requirements than most other crops but when farmers learn just what it requires they can grow it with little more trouble and with a great deal more profit than a number of plants they are now trying to grow. And what crop is it that we raise that does not fail us some times? Our old standby, corn, is occasionally a bad stand or cut short by drouth, but we go right ahead and grow our full acreage of corn just the same. The great apostle of alfalfa, F. D. Coburn, says there are only two kinds of soils that will not grow alfalfa and those are a wet soil and a sour soil. If your land is too wet to grow red clover, too wet to grow good corn in a normal year you need not bother about trying to grow alfalfa without thoroughly draining the land. If the land is sour the bacteria necessary to the growth of alfalfa will not thrive and you will fail unless you sweeten the soil with lime. But there are thousands of acres of Missouri land well adapted to growing this best paying crop if given half a chance. First for your alfalfa field select a piece of well drained land and if not already dry you will find that with alfalfa and all crops you grow it will pay to drain the land. If the water stands on the surface for two or three days after a big rain or during a wet spell, better drain it before you try alfalfa. Next you better test the soil for acidity unless your land grows clover luxuriantly or it may be that some neighbor has succeeded in growing alfalfa on the same kind of soil then you are safe in going ahead without a soil test. Any farmer can test his soil for a cost of five cents and to be on the safe side he had better do it.

From your drug store get five cents worth of blue litmus paper, best quality, and keep the paper in a corked bottle and do not handle it with the fingers but handle with a pin or pair of pincers. The test is then made as recommended by Dr. Van Slyke, New York Experiment Station, as follows: "Take an ordinary, flat-bottomed glass tumbler and cut out round pieces of perfectly clean white blotting paper of just the size to fit closely in the bottom of the tumbler. Place the strip of litmus paper at the bottom of the tumbler, over this put the round piece of blotting paper, and then put in some of the soil to be tested. Add enough water to make the soil thoroughly wet and cover the glass with a saucer or other convenient dish. Prepare another tumbler in just the same way, except that no soil is added but only water; this is a blank or check test to show whether the water or the blotting paper used affects the litmus paper. These should be allowed to stand at least two hours; the color of the litmus paper against the clean white background can then be examined through the bottom of the glass. If the litmus paper has turned red in the tumbler with the soil in it and remains unchanged in the other the soil is acid. If the litmus paper is red in the other tumbler that shows that some acid is in the blotting paper or the water and another test should be made changing both. It is best to use pure rain water for the test."

If the soil shows only slight acidity it may be possible to sweeten it by a heavy application of barnyard manure and if there is much acidity it will be necessary to put on lime, one to two tons of ground limestone per acre. Fortunately most Missouri soils contain sufficient lime and this expense is not necessary but no one should be deterred by the expense when it is necessary because the increased profit from the alfalfa and other crops will soon pay for the lime with an added profit. As the limestone has a tendency to gradually work down in the soil it should be spread after the land has been plowed and before the alfalfa is seeded.

Manure and Fertilizers Needed

A crop that grows fast enough to produce three or four cuttings a year requires a good fertile soil and there is very little land anywhere that will not show good results from spreading six or eight big loads of manure to the acre. On thin land a much heavier application should be made. It will pay on most land to put on fifty pounds of acid phosphate fertilizer with each load of manure or else put on the land just before seeding 300 pounds of bone meal to the acre. The manure should be spread before the land is plowed so as to get it thoroughly mixed with the soil.

Preparing the Seed Bed

The preparation of the seed bed is an important matter in growing alfalfa although sometimes a man succeeds by sowing it carelessly, but it will not pay to take the risk when sowing so valuable a crop. It pays to plow the land deep, just as deep as your team can pull the plow. Joe Wing is quoted as saying he would plow the land 20 inches deep if he could make a plow run that deep. Whether the alfalfa is seeded alone or with a nurse crop plow deep and unless the land will have a good while to settle it should be disked thoroughly and as deep as possible before plowing. It is a good plan to sow cowpeas or soybeans on the land before the alfalfa because these crops leave the soil in good condition and because they may be taken off in time to sow the alfalfa and the use of the ground is not lost for a season.

On good rich soil it is safe to sow alfalfa right on the wheat in the spring about the same time red clover is sown. When this is done it is a good plan to sow when the ground is dry about the first week in April and cover the seed with a good sharp harrow. Others have obtained a good stand by sowing with oats or spring barley, but when this is done the grain should be seeded rather light, one bushel of oats will be enough. The oats should be cut for hay when about in the milk stage for if allowed to ripen they take too much moisture from the soil and the alfalfa may perish. We think all things considered the best time to sow alfalfa in Missouri is from July 15 to September 1. Although as before stated spring sowing may do well and occasionally a stand is secured by seeding late as October. On fallow land we would plow the land in June and on land where a spring crop has been taken off we would plow immediately after the crop is harvested. Then we would work the land occasionally with disk and harrow to kill the weeds and fine the soil and after a good seed bed was secured we would sow as soon as we thought there was plenty of moisture to germinate the seed.

Alfalfa seed may be sown with the seed attachment of the grain drill or sown broad cast. We prefer the drill covering the seed one-half to one inch deep and if sown broadcast covered with a smoothing harrow. Some sow wheat with alfalfa one-half bushel per acre to give winter protection but where the seed is put in by September 1 that is not necessary. When the alfalfa makes a good growth in the fall some are tempted to pasture it but this should not be done. The tramping will injure the young plants and it will need a good fall growth for winter protection. It is usually recommended to sow 20 pounds of seed per acre but with good seed and a good seed bed 10 or 12 pounds will give a good stand.

Inoculation Important.
